In modern motors provision is made for the crankcase compression by fitting breathers or standpipes. These consist of open pipes leading into the crankcase, extending vertically and being several inches in height. The top of these members, and usually more than one is fitted, is covered with a fine mesh screen to keep out foreign elements. Not only do the breathers relieve excess compression in the crankcase but they are utilized in replenishing the supply of lubricant in the crankcase and in introducing kerosene when this requires cleaning.

When the valve tappet guides and tappets are worn, and no method incorporated for relieving the compression in the crankcase, the lubricant will be forced out and it is impossible to keep the valve side of the motor clean. Even the fitting of breathers will not wholly eliminate the trouble, nor will cutting down the supply of lubricant effect a cure.

New Members Expensive.

The proper method is to replace the worn members with new parts and with a four-cylinder motor this means eight valve tappet guides and a like number of tappets, incurring considerable expense, the amount depending upon the design. The worn parts could be removed and new guides turned out, but the cost of machining and fitting in some cases probably would not warrant the expenditure.

Leaky members may be cured or conditions bettered by relieving the crankcase compression with breathers if the motor be not thus equipped. At Fig. 2 D is shown an inexpensive breather applicable to a motor, the design of which will not permit the use of a vertical member. That referred to consists of two pieces of brass piping having both ends threaded, an elbow and a cup shaped member. These may be procured at any wholesale plumbing shop and are not expensive. The inside diameter of the pipes should not be less than .375 inch, this depending upon the size of the motor, etc.

A hole is drilled in the crankcase and tapped, and the parts assembled as shown. The cup shaped member should be fitted with a screen and this may be soldered. It should screw up snugly but fit so that it may be removed easily when desired. The number of breathers will depend upon the motor. Some makers fit one large member while instances of four of these devices are noted.

Supplying Grooved Members.

At Fig. 2 is depicted several methods of remedying leaky valve tappet guides and tappets. That at A consists of cutting vertical grooves in the tappet. The objects of these are to provide a passage for the oil that works up to return to the crankcase. At B is shown a circumferential groove, this being about .125 inch deep. Connecting with this are two grooves, one on either side, and these lead to the bottom of the tappet. Any oil working up will gather in the larger recess and find its way back into the crankcase. At C is outlined a method of cutting two grooves in the guide bushing and it will be noted that the top of this member is cup shaped. This gathers the superfluous lubricant which runs back into the crankcase through the two grooves in the bushing. This repair will appeal to the average motorist as the bushing is easier to cut than the tappet which is hardened and will require drawing of the temper and rehardening.

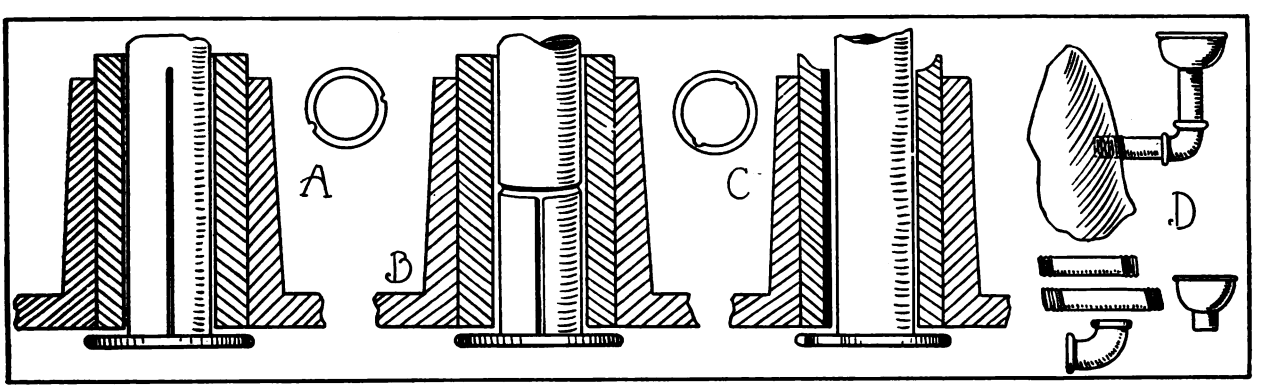

Fig. 2—Remedying Leaky Valve Tappets: A, Cutting Grooves in Tappet to Allow Oil to Return to Crankcase; B, Circumferential Recess and Grooves; C, Cupping Valve Guide Bushing and Grooving Sides; D, Home Made Breather Adaptable Where Vertical Member Cannot Be Fitted.

ANTI-FREEZING SOLUTION HINTS.

With the approach of April the cooling system of the motor car should be given consideration. Those who have employed an anti-freezing solution of sufficient strength to take care of low temperatures will discover that the motors on mild days show signs of heating, especially if operated with a retarded spark or allowed to run idle.

This does not indicate that the cooling system is at fault. It must be remembered that denatured alcohol boils at a temperature of about 172 degrees Fahrenheit and that even when blended with water, will heat more easily than the latter alone. Many

Digitized by Google

motorists are still employing a solution having 25 per cent. alcohol, but this is not necessary as it is to be doubted if the thermometer will register many degrees below the freezing point from now on.

Five per cent. of alcohol and 95 per cent. water will not freeze with temperatures higher than 25 degrees above zero Fahrenheit, and a solution of this strength will not unduly overheat the motor even when the thermometer registers well above the freezing point. If the car be exposed to the cold it is well to employ a solution of the above strength until well into April, as freezing weather will prevail at night.

Those who have made it a practise to cover part of the radiator should remove the covering on mild days or dispense with it entirely. The fan belt should be replaced to prevent the water in the cooling system from becoming overheated. If the old anti-freezing solution has been maintained at its full strength water should be added until the hydrometer shows but five per cent. alcohol. If the solution is dirty, it is an excellent plan to throw it away and use new. The radiator should be thoroughly cleansed before using the new mixture. This may be accomplished by making a saturated solution of sal soda or common washing soda, afterwards flushing out the cooler with clean water. The motor should be run during the operation to allow the fluid to circulate freely, and the water should be changed several times.

HOME MADE WORK BENCH.

Many owners garage their machines upon the premises and the average building is constructed to house one automobile and leave room enough to work around the machine. There is more or less minor work necessary, even if the owner does not attend to his own repairs.

Under these conditions and even where more extensive work is done the garage should include a work bench fitted with a vise. This combination will lighten labors wonderfully as well as facilitate the work. In addition the tools are kept in their proper place, being handy when needed and economy is effected as their cutting edges are not damaged.

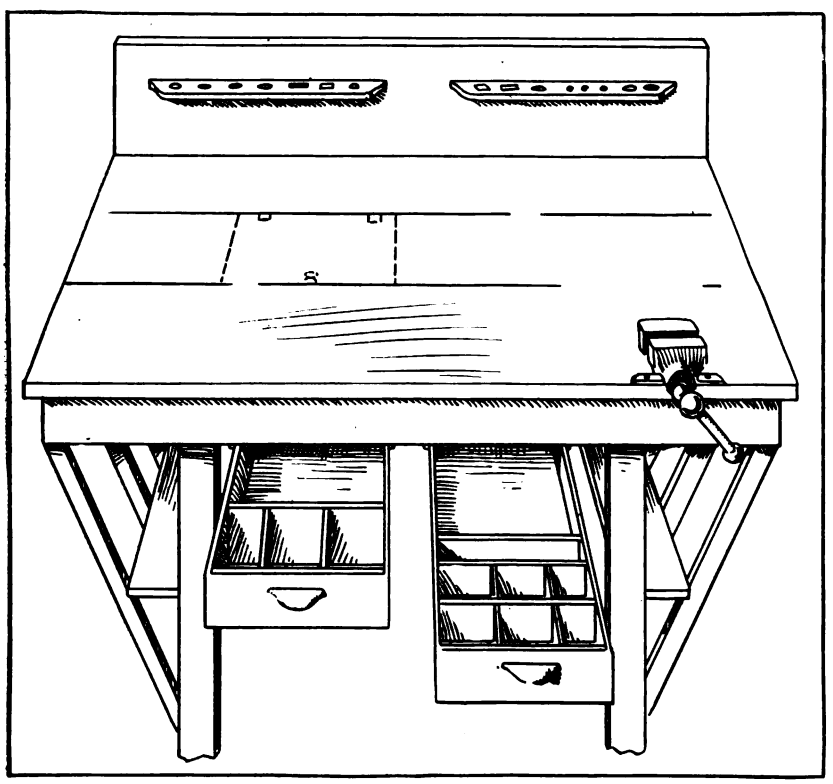

Fig. 3—Plan of Home Made Work Bench Which Provides for Shelves and Drawers, a Valuable Addition to the Equipment of the Private Garage.

A substantial work bench may be constructed at little expense if one can handle a saw, hammer and trysquare, and the design may be elaborate or simple, according to the tastes of the motorist. At Fig. 3 is presented a bench which will answer all requirements. It will be noted that provision is made for drawers and that in addition to the bench proper a lower shelf is included.

The dimensions of the design illustrated provide for a bench five feet in length, two in width and about two feet 10 inches high. The latter dimension may be increased or decreased according to the height of the user. It is not a good plan to build the bench so low that one will have to bend over in working. The height given is about the average.

The lower shelf is approximately three feet long and two wide. The side members are about nine inches wide and two feet long. It will be noted that the bench proper is fitted at the back with a vertical extension and that provision is made for the tools. Two strips are made of wood and these bored to take screw drivers, files, pliers, scrapers, etc. If one wishes to lock up the tools a section of the bench may be cut out and hinges and a lock fitted, the tool racks being attached on the inside, as outlined in the drawing.

The lumber used may be planed or unfinished stock, according to tastes of the owner. The planed material costs slightly more, but presents a neater appearance. The legs of the bench should be constructed of square joists and the bench proper of material at least two inches thick. The latter should be free from knots, and the planks nailed securely to prevent warping. The drawers may be made of whitewood, but they should be sturdy as in time con-

Digitized by Google

siderable heavy material will be placed in them.

The trays should be divided into several compartments in which the nuts, bolts, cotter pins, etc., should be separated. It is surprising to note the number of motorists and even repairmen, who jumble these parts together and when a nut or bolt is wanted, lose considerable time in searching for the desired article.

In the overhaul work the bench will prove useful for the various small parts may be stored on the lower shelves while the ample size of the bench proper will accommodate the cylinders and other parts removed for cleaning and attention.

A TIRE CHAIN HINT.

In the spring of the year when the frost is coming out of the ground one is apt to encounter mudholes, especially in the country. Even with the usual tire chains the motorist is liable to have the rear wheels sink deep in the mire and the car refuse to budge although the wheels spin. The following kink is suggested by an automobilist whose work carries him over the country roads throughout the year: If the wheels spin and become buried in the mud, remove the chains and take one member and wrap it around the tire as you would a blow-out patch. Treat the other wheel in a similar manner, and upon applying power with the low speed gear in mesh, the machine will jump out of the hole. The bunched up chain provides traction not possible with the member fitted in the usual manner.

TIGHTENING HUB CAPS.

Occasionally hub caps are lost through carelessness in replacing these members after lubricant has been applied. While they should be set up snugly, undue force should not be used as the threads of the brass member may become stripped. An excellent plan is to screw the caps up tightly then tap the wrench a light blow with the hammer. Sometimes too much lubricant is utilized and when tightening up the cap the grease gives one the impression the cap is snug.

DOUBLE CURING OF TIRES.

"Although the term 'double curing of tires' is mystifying to the average motorist, it is perfectly simple," says L. C. Rockhill of the Goodyear Tire & Rubber Company, Akron, O. "The Goodyear No-rim-cut tire passes through a long process between the time it leaves the factories until ready for shipment. Before it is cured the rubber is soft and plastic. It becomes more so when subjected to the steam heat of the curing process.

"The first step is the tire mold. This is continued just long enough to give the tire its shape and to insure that the layer of fabric and the gum of the carcass have been cemented thoroughly. Then the shoe is taken out of the mold and inspected carefully. This mid-cure examination makes it possible to detect 'duck pinches,' unsuspected accidental folds in the fabric, or any other imperfection that might creep in.

"The surface of the shoe is then roughened and the heavy rubber tread attached. When this is in position an air bag is placed inside the carcass and the tire wrapped firmly in a long strip of damp muslin. Then the air bag is inflated so that the tire, in the final cure, will take exactly the shape it will have when in use. By this method the possibility of unbalanced strains is eliminated."

CARE OF MAGNETO PLUGS.

Owing to the intense spark provided by the magneto the plugs should be removed occasionally and examined for satisfactory results. Unlike the ordinary plug, current for which is furnished by a battery, the magneto plug operates best with a small gap. This should be about .015625 inch, but it may be increased in time by the action of the heat. Sometimes erratic running of the motor at low speeds is due to irregular spark plug gaps. They should be uniform.

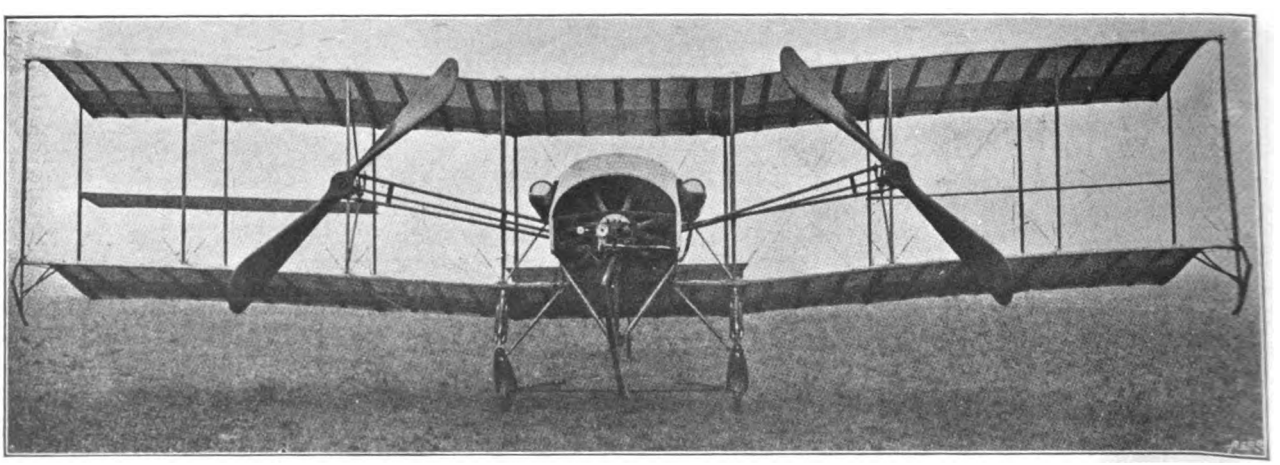
OVERLAND BOWLERS WIN HONORS.

The Overland bowling team, comprised of members of the Willys-Overland Company, Toledo, O., not only won the championship of Toledo but annexed seven records. The quintette broke all previous records and in three games bowled over 3100 pins, breaking the old record of 2962, made in 1909. Frank Seibert, a member of the five, won the individual championship of the city, defeating William Elwert, who has held the championship of the state for two years. By defeating all Toledo teams the Overland five won the right to enter the National Bowling Tournament which will be held in the International Amphitheatre, Chicago. Among the records made by the champions are the following: Team string, 1111 pins; three-string team total, 3100; high team average; high three-string individual total 694 by Frank Seibert, who also captured the individual championship with an average of 201 for 54 games. The members of the team which will represent Toledo at Chicago consist of Manager G. H. Caine, Frank Seibert, A. D. Root, W. Mattison, James Daly, C. Seibert, J. E. Carey and H. Leary.

INTER-STATE PUBLICATION.

The Inter-State Automobile Company, Muncie, Ind., is issuing a publication devoted to its interests named "The Inter-State Steering Wheel." It teems with incidents of interest to the motorist and contains several special articles, including a description of the electric lighting system utilized on these cars.

Digitized by Google



The Viking I, a new British biplane from the designs of H. Barber and constructed by the Aeronautical Syndicate, Ltd., is illustrated herewith. The machine has been flown successfully, and is regarded as a satisfactory example of the latest type of biplane produced in Great Britain. It has a number of individual features, although the arrangement of the twin propellers is copied from the Wright biplane, made by the Wright Company in this country. There is this difference, however—in the Wright the propellers are located at the rear of the trailing edge of the main planes, while in the Viking I they are immediately in front of the leading edge.

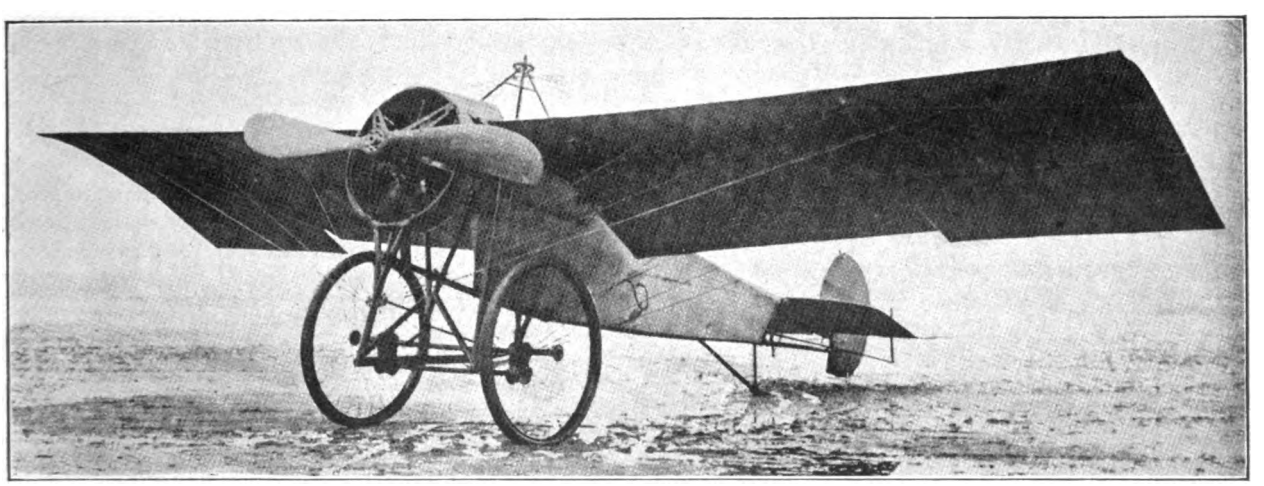
A careful examination of the photograph will show that each of the main planes may be regarded as consisting of three portions, the middle one, forming part of the main cellule, being horizontal, while the others are given a decided dihedral angle and a slight curvature. The tail is of the non-lifting type, while the elevator flap is made removable by withdrawing a single long wire bolt, and when this has been done each half of the fixed tail plane withdraws from the fuselage in exactly the same manner as the main plane of the ordinary monoplane. These fixed planes have no angle of incidence, but are cambered both top and bottom so as to be approximately of stream-line form.

The two propellers are driven by a 50 horsepower Gnome engine, through a plain and crossed chain, respectively. The landing chassis is of particular interest. Two wheels, united by a wooden axle universally jointed at each end, are carried each in a stout steel beam universally jointed to a triangulated upright, which descends from the main cellule. For up-and-down motion, the wheel beam rocks on a long tubular bearing. Three rubber buffers are disposed one behind the other, in order to reduce head resistance. In addition to this wheelbase, four skids are employed, one for the tail, one at the extreme front below the engine mounting, and one at either end of the wing tips.

While students of aviation are inclined to agree with the Aero Club of America that the most important development in the field of aeronautics during 1911 was the perfection of the machine designed to start from and alight on either land or water, there appears to be decided difference of opinion as to the proper name to apply to it. Previous to the original success of Glenn H. Curtiss in this particular field of endeavor, this type was termed an hydroplane, but inasmuch as this name had been used for some time by certain types of boats it was felt that it could not be continued for the newer craft.

Curtiss called his machine a triad, but this did not appeal to the public. In France it was termed a

Viking I, the New Biplane Constructed by the Aeronautical Syndicate, Ltd., of Great Britain, Employing Wright Type of Twin Propellers.



Digitized by Google

canard. England called it a water bird. Very soon the old term "hydroplane" was lengthened a trifle and the name became "hydro-aeroplane," but this has a hyphen in its composition and simplicity of nomenclature does not permit of the use of a hyphen when it is possible to dispense with it. The Aero Club of America, in awarding the Robert J. Collier trophy to Glenn H. Curtiss for his successful development of the craft, appears to have settled definitely the naming of the machine, in the following report of the committee, which has been accepted:

Having been appointed a committee of three to determine the winner for the year 1911 of the Aero Club of America trophy, presented by Mr. Robert J. Collier, we have met and beg hereby formally to notify you that in our opinion the trophy for the year 1911 should be awarded to Glenn H. Curtiss for his successful development and demonstration of the hydraeroplane.

(Signed) JAMES A. BLAIR, JR.,
HENRY A. WISE WOOD,
W. REDMOND CROSS.

As the Aero Club of America is the highest authority in aviation matters in America, it would appear that the term "hydraeroplane" is to replace all previous names suggested by an interested public.

Latest Vendome Military Monoplane, Possessing Original and Interesting Features, Constructed for French Army.

Raoul Vendome of France appears to be devoting himself entirely to the construction of military aeroplanes. His latest product is the military monoplane shown in an accompanying illustration. The principle feature of construction is the provision for taking the machine apart, easily and quickly.

The length is 22 feet nine inches, span 27 feet, chord six feet eight inches. When folded it will take up a space of six feet eight inches by 16 feet six inches by 10 feet. The total supporting surface is 182 square feet and the weight 440 pounds. The engine is a 50 horsepower Gnome.

After landing, the pilot by turning a small hand wheel mounted at the top of the four converging legs of the mast, can slacken off all the bracing wires of the wings without disarranging them in any manner. There are then two bolts to be loosened and two cotter pins to take out, in order to detach the upper wires. A third cotter pin loosens the lower front wires, and a fourth the rear main plane wires. The planes can then be taken off immediately. Unfastening a joint of the fuselage back of the tail skid is accomplished by removing one security bolt. All the back portion of the fuselage can be folded on its hinges.

Particular attention should be called to the landing wheels, which are three feet 10 inches in diameter. The underlying idea of this design is that on very uneven land the running wheels are liable to become caught in the irregularities of the soil, and the machine may be overturned. Vendome considers that front skids not only do not prevent capsizing but frequently cause it by digging into the ground. Hence, the large wheels.

It develops that the Aero Club of Switzerland mailed its challenge for the Gordon-Bennett cup before March 1, the date on which opportunity for challenging expired, and this means that six nations are eligible to compete for this premier air prize. Great Britain, France, Belgium and Holland are the other challengers. The cup is now held for America by Charles Terres Weymann.

While none of the competing nations has selected its team, or made any steps to do so, there is much speculation as to the men and machines which will be seen in this event. Claude Grahame-White has announced his intention of attempting to make the British team in a monoplane of his own construction, modelled somewhat after the Nieuport, which he flew with success in this country last year. It will be fitted with a 100 horsepower Gnome engine, as was the Bleriot monoplane, with which he secured the cup in 1910.

Gustave Hamel, who flies a Bleriot, is the second man to apply for permission to represent Great Britain. He flew a Bleriot in the third race at East-

Digitized by Google

church, England, last year. At present, it looks very much as if Alec Ogilvie, who has represented his country in two previous international races, flying a Wright biplane, would be the third British contestant.

Two names are most frequently mentioned in France, and these are Jules Vendrines with his Deperdussin monoplane, and Leon Bathiat and his Sommer monoplane. Of course, there are a large number of men and machines in France who may be looked upon as eligible for the honor, and it is probable that an elimination race will be held to pick the team as in past years.

Each country is entitled to three representatives. Victor Jonckheere of Belgium is at present in this country, accompanied by his Bleriot monoplane. While there are a number of better known aviators in Belgium, Jonckheere only recently having secured his license, some speculation is being made as to whether or not he may be selected as one of the Belgian team.

Easily the best known aviator in Switzerland is Edmond Audemars, who has flown in America on several occasions. His mount on his last visit here was a Santos Dumont Demoiselle, which hardly measures up to international racing proportions. If selected, he undoubtedly will secure a French machine of late design.

Weymann will have the honor of representing America without further question. He flew a Nieuport monoplane in winning the third race last year, and probably will be at the wheel of a machine of that make again this year. Several American aviators are expected to enter the list, and it is anticipated there will be no difficulty in holding an elimination event for the purpose of selecting this year's team. When it comes to machines, there seems to be a lack of American made aeroplanes which can be classed as having demonstrated sufficient speed to win the cup. It would appear that some American constructor had a splendid opportunity to cover himself with glory by bringing out a machine which will insure the retention of the cup.

Following extensive experimentation with the first Curtiss hydraeroplane purchased by the Russian government and a tour of France for the purpose of investigating the types manufactured in that country, the Russian naval commission has cabled from Paris an order for three more Curtiss machines, made by the Curtiss Aeroplane Company, Hammondsport, N. Y. The new hydraeroplanes will be equipped with 75 horsepower Curtiss engines, instead of 50, as utilized on the first.

Two of the new Russian machines will have a spread of 35 feet six inches, while the third will be constructed for greater speed and with a spread of 33 feet one inch. All three will be equipped with the dual system of control, and will be of the passenger carrying, single pontoon biplane type. Acceptance trials are to be held in France.

Although it has been announced that the fourth race for the international cup undoubtedly would be held some time in September or October, no definite date has been set. The Aero Club of America has until April 1 in which to arrive at a definite decision, both as to place and date.

The Aero Club of Illinois appears to be taking it for granted that it can have the meet, and there seems to be no other active candidate for the honor. An effort is being made to combine this meet with the annual Chicago yachting carnival, which has been set for the week of Aug. 10.

Chicago has decided that the Skokie golf course would prove a satisfactory flying field, although this must be passed upon officially by representatives of the Aero Club of America before acceptance. It is proposed to hold the international race on the first day of the meet, to be followed by six days of contests and cross country flying.

P. E. Taft of Springfield, Mass., and Fred Kingsbury of Hartford, Conn., have constructed a hydraeroplane with which they expect to make flights from the Connecticut river during the coming spring. The first tests will be made immediately after the high water goes out early in May.

W. Starling Burgess of the Burgess Co. & Curtis, Marblehead, Mass., has begun a new series of tests with the Burgess-Curtis hydraeroplane at Marblehead bay. Government officials are expected to arrive at the plant in the near future to witness tests of the new aeroplanes, both biplane and monoplane designs, now being constructed upon order from the War and Navy Departments.

George E. Holt, Nels Olesen, Frank Rodgers, Roland Middleton, Charles Hoeflich and Henry Snyder, known as the McLaughlin aviators, have left New York City for South America, where they will give a series of exhibition flights in Brazil, Venezuela, Chili and Peru, under the management of Peter F. McLaughlin.

Henri Selmet, a French aviator, finding himself in London, England, and desiring to visit Paris on business, early in the month, flew a monoplane between the two cities, a distance of 22 miles in 2:57:00. This was in less than half the time that would have been required in travelling by the fastest land and water transportation available between these two points.

Brig.-Gen. James Allen, U. S. A., has outlined his plans of organization for a complete aviation corps of the United States army, composed of 24 aeroplanes, three majors, 54 captains and lieutenants and three surgeons. His idea is to have six companies, each with four aeroplanes, composed of nine officers and 12 enlisted men, besides a property sergeant, clerk, cook and assistant cook. The six companies would be divided into three battalions, each battalion under a major and having its own surgeon.

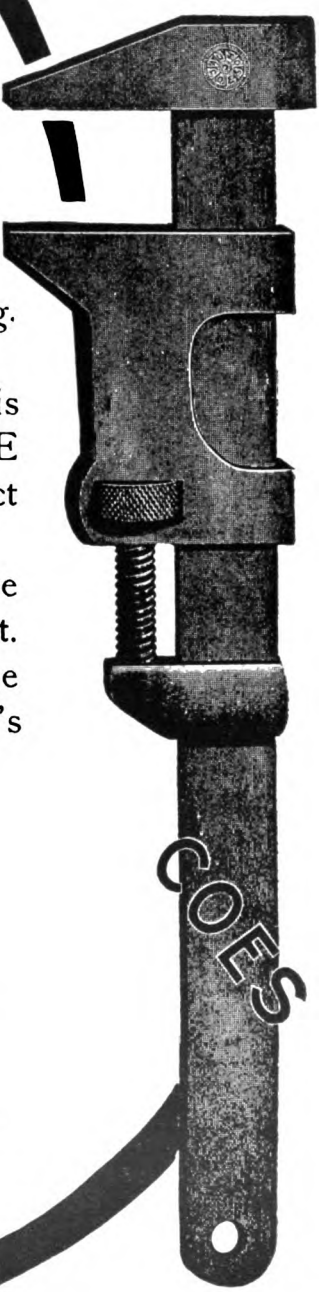
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

Send for Literature Now.

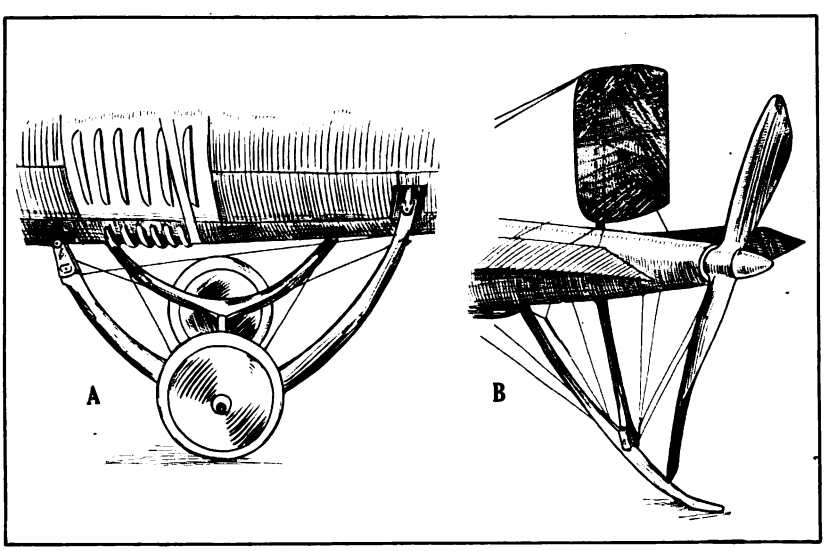
Perspective View of Paulhan-Tatin Monoplane, Termed an Aerial Torpedo and Designed to Effectually Reduce Head Resistance.

Digitized by Google

PAULHAN-TATIN AERIAL TORPEDO.



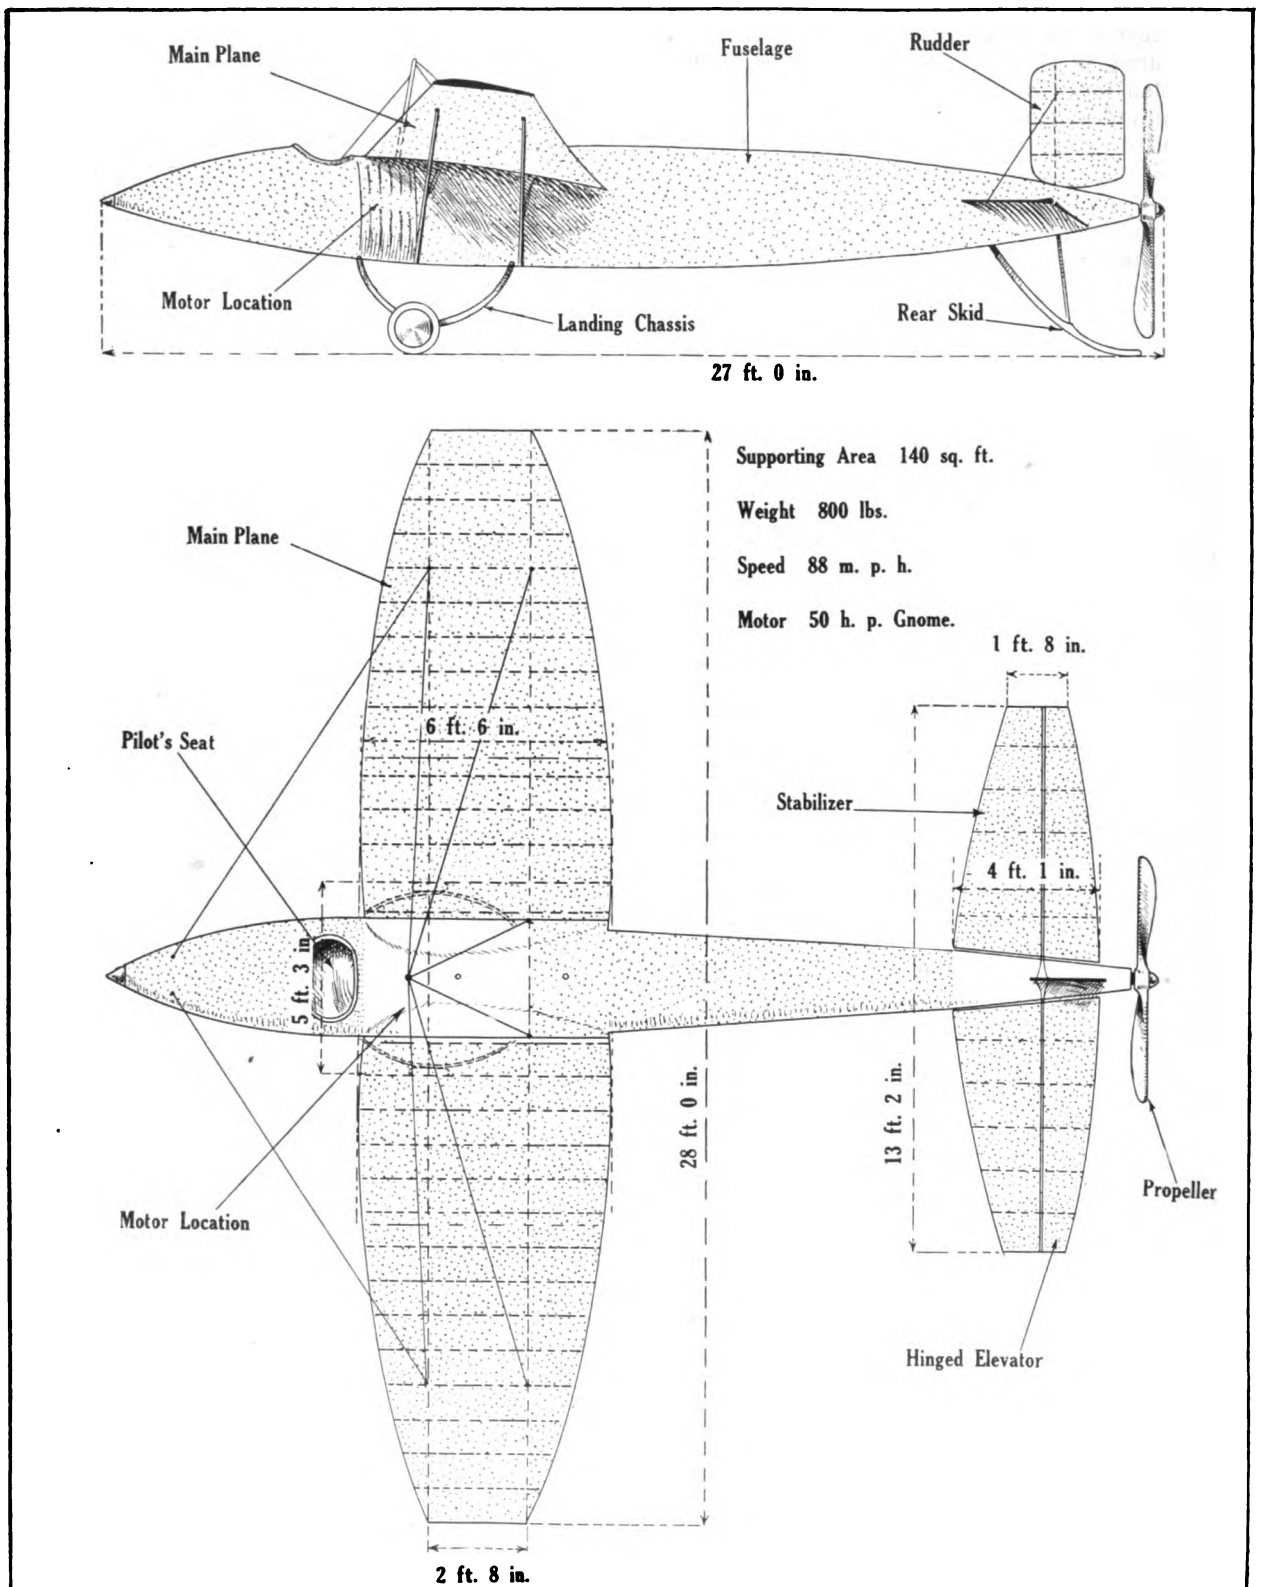
Victor Tatin of France has been experimenting with mechanical flight over 33 years. In 1879, at Chalais-Mendon, he flew a model, driven by compressed air, which bore some resemblance to the present Paulhan-Tatin monoplane, which is called by the makers an aerial torpedo. The model of 1879 was a monoplane in plan form, with a wide spreading tail and two four-bladed propellers disposed immediately in front of the leading edge of the main plane.

It will be noted, by examination of the accompanying drawings, that the chief change in design is in the location of the propeller at the rear. The main plane has been altered slightly, having upturned wing tips. The form of the tail has been changed but little and the addition of the rudder is the result of more extensive study. In the main, however, the present day successful machine expresses practically all of the novel ideas which had their beginning in the brain of M. Tatin long before the problem of aerial flight had been solved.

Associated with M. Tatin in the production of this very original design is Louis Paulhan, well known as a pioneer aerial pilot and a designer and constructor of some note. It seems probable that M. Paulhan was of material assistance in working out the plans conceived by M. Tatin, and despite the fact that their product was originally regarded much in the nature of a freak, it has developed a speed of 88 miles an hour over a measured course in the hands of Louis Gaudart.

The construction is the result of a sincere attempt on the part of the designers to secure speed and stability by reducing head resistance so far as possible. The result is a stream-line body, in which the fabric covering extends from one end to the other, being supported on wooden forms applied over the fuselage proper. The propeller location is a part of the same general scheme, it being claimed for this that the screw revolves in the region of air disturbance that follows the machine and therefore is enabled to work with greater efficiency. It is said that M. Tatin began to experiment with the propeller in the rear something like 20 years ago.

In the immediate front is the wind cutting head, back of which is the pilot's cockpit, with a seat so low that only the head of the operator extends above the machine. In order to still further eliminate head resistance, an effort has been made to locate as many organs as possible in the interior of the fuselage.



Some Constructional Details of Paulhan-Tatin Aerial Torpedo: A, Landing Chassis and Motor Location; B, Tail Formation and Radiator Mounting.

Thus, the motor, a 50 horsepower revolving Gnome, is located directly behind the driver, and is completely enclosed, the covering at this point being supplied with slight ventilator openings for the purpose of admitting sufficient air to cool the engine. The shock absorbing section of the landing chassis also is disposed inside.

The fuselage proper is of the ordinary box girder section. This is later made duo-decagonal by a series of light wooden forms, over which the fabric is stretched. From a point beside the pilot's cockpit the

Digitized by Google

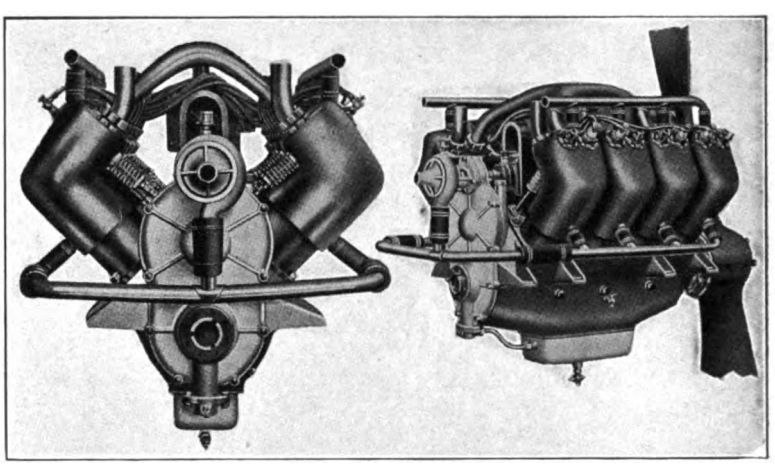
Plan View and Elevation of Paulhan-Tatin Monoplane, Showing Detailed Dimensions and Principal Features of Design.

Digitized by Google

outside form tapers gradually to the propeller and beyond that to the tip of the metal boss, which holds this securely in place.

In plan form the main plane may be represented by an ellipse with its tips cut away by lines parallel to its minor axis. In front elevation, it has the appearance of an ellipse which has been cut by a line parallel to and below the major axis. Very little camber and very little angle of incidence are evident in the wings, which are upturned at the tips in order to provide the machine with a modicum of natural stability. These offer practically the only method of obtaining lateral balance, although a slight wing warping effect is gained by operating flat steel bands proceeding from the base of the fuselage. Two of these steel ribbons on each side serve alone to support the central body in flight, and it is the rear member of this pair which is used for such wing warping as is held necessary.

The tail is monoplane in design, being almost identical with the main plane, except for the upturned tips. The forward portion is the stabilizer, and this is flat. Behind it is hinged the elevator, a pair of simple flaps operated by cables running to a crank arranged in the interior of the fuselage. Mounted vertically above this surface is the rudder, balanced and approximately rectangular in shape.



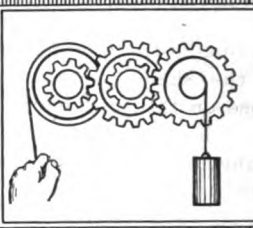
The propeller is a Regy Freres of eight-foot pitch, which is protected against contact with the ground by a high skid, properly guyed by wires. A simple tube is utilized in conveying power from the engine this being supported at intervals throughout its length by six ball bearings, each of these being strung into place by steel wires. Strength and simplicity mark the landing chassis, which possesses the advantage of offering litle resistance to forward advance. The common axle connecting the two pneumatic tired wheels, is attached to two arcs of hickory. At their forward extremity these arcs are hinged to the fuselage, and at their rear end they are united by a strong piece of wood, which is in turn strapped by means of a cotton covered rubber cord to a reinforced cross member of the lattice girder body. In this manner the shock absorbing device is arranged in the interior of the fuselage. The cross bracing consists of six wires or light rods, which are passed through the arcs and tightened by means of nuts and lock nuts on the outside. The wheels are fitted with spun steel discs.

THE FRONTIER AERO MOTOR.

A number of satisfactory aerial motors has been brought out in this country, and among these is a new V engine of eight cylinders, which was shown for the first time at the recent Boston automobile show. This is the product of the Frontier Iron Works, Buffalo, N. Y., and is depicted herewith in end and side views.

The unit is a four-cycle, eight-cylinder, V type engine with water-cooled cylinders. These members are cast separately of a special strong metal which insures strength and long wearing qualities. They are furnished with either iron or copper water jackets, the latter being put on by the electrolytic process. The eight cylinders are bolted to a base of unique and original design, combining strength, lightness and compactness. The base is a single casting of special aluminum alloy with webs to receive the bearings.

The camshaft works in a chamber cast integrally with the base and is supported and run in imported annular ball bearings, as is also the crankshaft. With this construction, it is claimed, that friction is reduced to a minimum. The crank and camshafts, cams, gears, valve stems, connecting and pushrods, are made from Krupp's 3.5 per cent. chrome nickel steel, heat treated, and hardened and ground by special machinery. Crankshafts, connecting rods and piston pins are hollow.



New Frontier Eight-Cylinder, V Type Motor: At Left, End View; at Right, Side View with Propeller.

Lubrication is supplied by a bronze pump, geared from the crankshaft and connected to an oil tank located in the base, from which the oil is forced through the crankshaft up through the connecting rods to the piston pins, thence to the cylinder walls, the surplus returning to the tank, in which is located a strainer. The cooling system is provided by means of a circulating pump, forcing the water through the cylinders and radiator.

The valves are of such diameter as to insure the rapid and efficient receiving and discharging of gases. The intake and water manifolds are copper, designed to give an equal supply to each cylinder. The exhaust manifolds are seamless steel tubing, formed to comply with the openings in the cylinders. The motor is equipped with the firm's own distinctive standard float feed carburetor and ignition is by Bosch magneto.

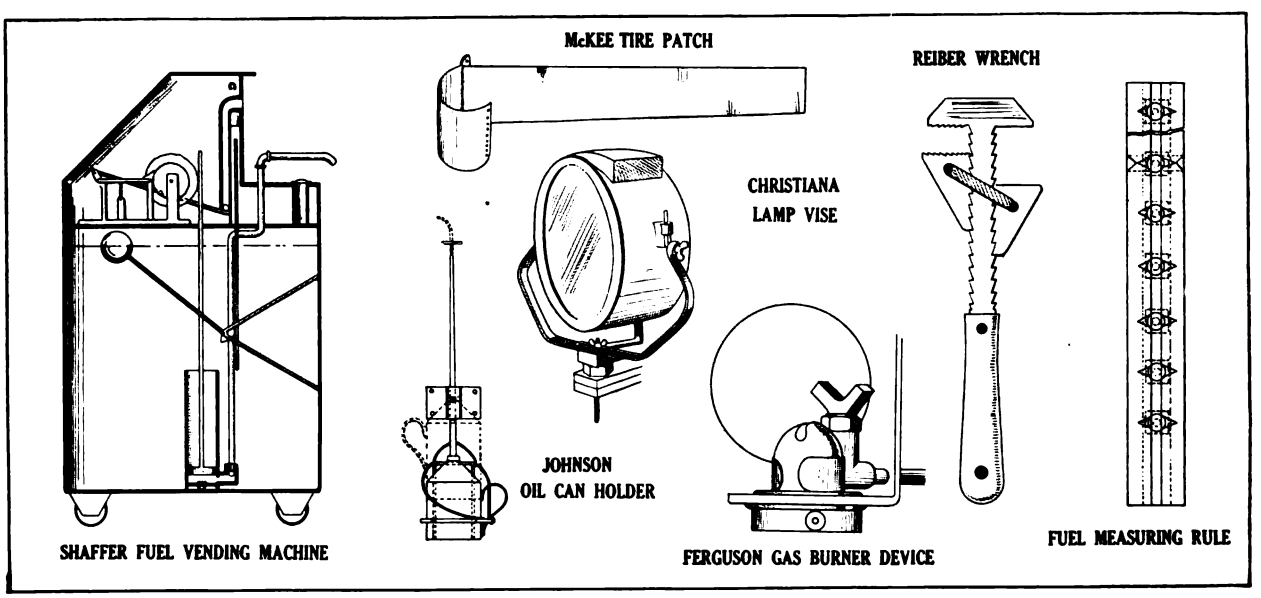
RECENT MOTOR VEHICLE PATENTS

Automatic Fuel Vending Machine.



An automatic gasoline vending machine of the coin-in-the-slot type is the invention of Randolph Shaffer, Albany, Ga., to whom a patent has been issued. The exterior of the fuel container is similar in appearance to that of the usual oil tank and is mounted upon wheels so that it may be moved readily, although means are provided for fastening the device securely. A slot for the insertion of a coin is placed near the top of the vessel and the passage leads to an arm or lever which is connected with another member suitably equipped with a pawl in mesh with a ratchet wheel. The latter is connected with a larger wheel provided with teeth and these are in mesh with a vertical rod which extends downwards to a piston operating in a cylinder in the fuel chamber proper. When a coin is inserted in the slot, the pawl is released and the piston in the chamber descends, forcing a predetermined amount of gasoline through a pipe connected to the piston chamber, upward and out through a suitable nozzle located on the exterior of the vessel. An ingenious arrangement is provided for closing the coin slot when the fuel is exhausted or has reached a certain point. A vertical rod is fitted and this extends upward and into a passage to the coin slot. In conjunction with the rod is a pivotally mounted arm carrying a ball which acts as a float. When the gasoline falls to a predetermined level, the float lever actuates the device in mesh with the toothed rod, and the latter rises, closing the opening into which the coin is inserted, thus preventing loss of the coin as well as signalling that the fuel has become exhausted.

McKee Pneumatic Tire Patch.

Clarke W. McKee of San Diego, Cal., has been granted a patent for a blow-out patch with which it is claimed that creeping is eliminated. It is constructed of a band of non-elastic material tapered toward one end and of sufficient length to wrap the tire one or more times. The smaller end is tapered while the larger extremity is made of heavier material and provided with a short flap with eye holes for lacing when the device is attached to the shoe. It is claimed that the patch will remain as attached if properly fitted.

Reiber Wrench.

A wrench having adjustable features, also providing means for two different sized openings of the jaws at the same time, has been patented by John Reiber, Huntington, Ore. The shank of the tool is

Some Recent Ideas of Inventors Working on Automobile Parts, Accessories and Appliances, Including an Automatic Fuel Vending Machine of the Nickel-in-the-Slot Type.

Digitized by Google

fitted with double stationary jaws, these projecting from opposite sides thereof at one end. The sides of the shank are fitted with a series of teeth, these extending to the handle. A movable jaw on either side of the shank is fitted with teeth corresponding to those on the stationary member and these mesh. The movable jaws are connected by links having pivotal connections and the latter provide an independent movement of each member permitting a step-by-step adjustment. A release is effected by a simultaneous pressure on the movable jaws in the direction of the stationary members.

Gasoline Measuring Rule.

A fuel measuring rule which presents practical features has been patented by Frank M. Edmonds and Russell J. Goodnow, Boston, Edmonds being assignor to Goodnow. It consists of a rod having a number of pointers mounted thereon and these indicators are movable the entire length of the device. Another member is so fitted that it may be slid up or down without interfering with the other indicators. If a fuel tank is to be measured, a gallon or any part of this measure, is poured into the container and the rule inserted, the height of the fluid noted, and the lower indicator set. This operation is continued until the tank is full and the measurements desired obtained. The rule may be calibrated to secure any measurement and the loose sliding member employed to ascertain quantities between the markings.

Christiana Lamp Vise.

A device for holding automobile headlights is the subject of a patent granted to Elmer V. Christiana, Kingston, N. Y. It comprises a base for attachment, and a pair of laterally adjustable oppositely arranged arms mounted upon the base. The lower ends of these members are flat and slotted to fit a bolt or stud having a wing nut for locking the parts securely. An L shaped bracket is also incorporated and held by similar means. The ends of the brackets are provided with means for holding the lamps also wing nuts for clamping the attachment securely.

Ferguson Gas Burner Attachment.

A device for converting oil lamps into acetylene or gas burners has been patented by John Ferguson, New York City. It comprises a spring clip consisting of separable spring jaws to embrace the flame guard of an oil burner. An elbow pipe is fitted securely to the clip, one end of the former being upright and containing means for attaching an acetylene burner. Leading from the elbow is a gas conduit or pipe, this extending through the side of the lamp for means of attaching the tube connecting with the gas container.

Johnson Oil Can Holder.

A patent has been granted Isaac R. Johnson, Milwaukee, Wis., for an oil can holder. It comprises a back brace, part of which is securely fastened to the place of location. To the ends of the rectangular brace is attached a hoop member and a guide rail is incorporated between these parts. A backbone extends from the back brace and the former is fitted with a can nozzle retaining loop, also a bracket for securing the oil can.

CHARLES LEWIS DIES SUDDENLY.

Charles Lewis, one of the pioneers of the manufacturing industry of Jackson, Mich., died suddenly in that city recently. He was at the head of a number of extensive manufacturing companies being one of the founders of the Jackson Land and Improvement Company which purchased large tracts of land and utilized the profits accrued in erecting factories. In 1898 he became interested in the automobile industry and later became associated with George A. Matthews, and the Jackson Automobile Company was the result of this combination. The company soon outgrew its quarters, erecting a larger plant, and became the leading industry of Jackson. Later the plant of the Clark Motor Company was absorbed. Mr. Lewis retired from the Jackson Automobile Company two or three years ago and last fall consolidated several companies making automobile axles. Mr. Lewis was active in municipal affairs and a director in several organizations.

SELLS MANY HUPMOBILES.

A sale involving 123 automobiles has been consummated by the Richardson-Neighbors Company, Pittsburg, Penn., agent for the Hupmobile, made by the Hupp Motor Car Company, Detroit. The business of the company had assumed such proportions that it was found impossible to give proper attention to buyers from counties surrounding Allegheny and it was decided to appoint sub-agents. These were selected at the automobile show in Pittsburg and they purchased 123 cars. Four represent Pennsylvania, two are in West Virginia and one in Ohio.

ONTARIO WOULD TAX AUTOMOBILES.

The Legislature in Ontario is considering a bill to tax motor vehicles on the basis of 25 cents a horsepower on cars of 20 horsepower or under, 25 cents for every 10 horsepower above that figure to 40 horsepower, and $1 a horsepower above 40. Another bill provides for an appropriation of $5,000,000 for good roads, it being argued that this will aid materially in bringing tourists to Ontario.

BIRMINGHAM DEALERS ORGANIZE.

Permanent organization of the Birmingham Automobile Dealers' Association, Birmingham, Ala., has been brought about with the following officers: President, Judge Dan A. Greene; vice president, Hubert A. Drennen; treasurer, Leo Loeb; secretary, E. W. Brownell. Among other things, the new association will make an endeavor to have Birmingham included on the itinerary of the 1912 national tour.

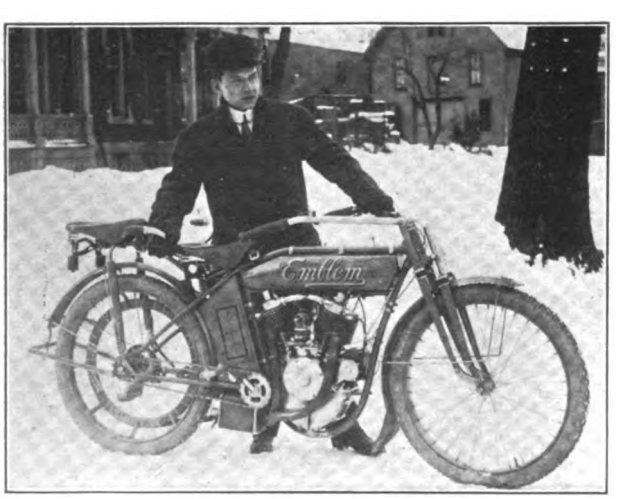
ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER



Plans for Coming Season.

The first few warm days have had a wonderfully stimulating effect upon the riders and from now on the club rooms will begin to teem with plans for the riding season. Of course there will be club runs and contests of various sorts, but if the information at hand is any indication, there is to be even more touring this year than last. Perhaps there will be opportunity to interest the boys in one of those new side car attachments as well.

In any event, a great many riders have been studying the touring maps very industriously during the past few months and there are several reports of long distance tours in prospect. And here is a hint for the clubs. Instead of letting one or two of the boys go off on a vacation by themselves it would prove just the thing for a fairly good representation of the club to go along and make the affair even more jolly. The expense could be shared, and thus made lighter, and in many ways it would help to create interest in the organization.

Of course it is taken for granted that the riders belong to the Federation of American Motorcyclists, and if they do they are bound to find that the officials of that organization have been busy in their interests throughout the winter months. For one thing, there is a string of registered repair shops scattered all over the country, and in each case the proprietor is willing to put up the machines over night or for a day without charge. Secretary G. B. Gibson, Westboro, Mass., expects to send out a list of these shops, corrected right up to the minute, within a few days, and there will be no reason for not finding a friendly welcome along the touring line.

A. C. Moore, Cortland, N. Y., Local Emblem Agent and Club Captain.

Club Captain Rides Emblem.

A. C. Moore, one of the club's most energetic members, has been elected captain of the Cortland Motorcycle Club, Cortland, N. Y. Moore is shown in an accompanying illustration out on a demonstration trip with plenty of snow on the ground and the thermometer near zero. He is Cortland county agent for the Emblem, made by the Emblem Manufacturing Company, Angola, N. Y., and has proved a very efficient business man as well as popular leader in club affairs. He is busy just now in stimulating interest in a race meet to be held by the club, Memorial Day.

Fill Out the Cards.

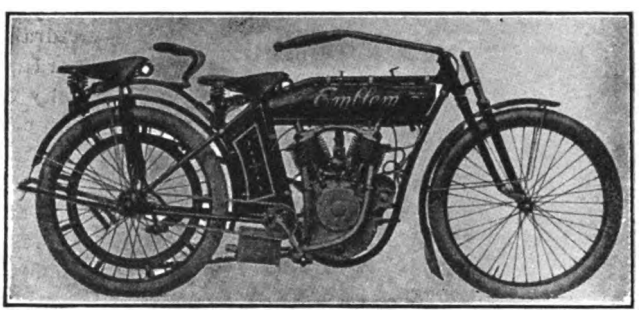
Secretary G. B. Gibson of the Federation of American Motorcyclists, whose address is at Westboro, Mass., has been sending out return post cards in an effort to locate the president and secretary of all motorcycle clubs. Dr. Gibson needs this information to bring his files up-to-date, and those who have received the cards are earnestly requested to supply him with the necessary data without delay.

Merkel Man Becomes an Indian.

It will prove something of a surprise to learn that Edward Buffum, who has been connected with the manufacture of the Merkel for so many years, has resigned his position with the Miami Cycle & Manufacturing Company, Middletown, O., to join the sales staff of the Hendee Manufacturing Company, Springfield, Mass., maker of the Indian. Mr. Buffum will be one of Sales Manager F. J. Weschler's chief lieutenants, and it is anticipated that his wide knowledge of men and affairs in the motorcycling world will prove of decided value to the Hendee company.

Cleveland Wants National Assembly.

That the Cleveland Motorcycle Club is in earnest in its effort to secure the national assembly of the Federation of American Motorcyclists for Cleveland,



Digitized by Google

OUT IN GAYLORD, KANSAS

There is a young man less fortunate than his fellows in that he has but one arm. However, this young man–Mr Ernest Sonnenberg–is better off than many because he knows how to enjoy life. Mr. Sonnenberg rides a motorcycle and spends most of his time in the saddle–good weather and bad–often covering roads that his two-armed brethren fight shy of. Yes, Friends, Mr. Sonnenberg rides a

STURDY EMBLEM MOTORCYCLE

and there is a mighty good reason for his choice. Physically handicapped he must have a machine that always can be relied on to do its full work and more Not only this but the machine must be mechanically perfect and easy to handle in all conditions of traffic. The EMBLEM certainly fills the bill as witness this entirely unsolicited letter from Mr. Sonnenberg. In fact we were not acquainted with Mr. Sonnenberg until we received his letter. He says:

" . . . . As regards the Emblem Motorcycle with special control purchased from your dealers, Stephenson & Campbell of Gaylord, Kan., will say that I have owned three different motorcycles and I find the Emblem to be the most powerful, speediest, and moreover, the easiest to handle on the road, as it never skids on the sharpest turns".

Ernest R. Sonnenberg.
Signed

EMBLEM MANUFACTURING COMPANY
(Member M. M. A.) Dept. D,

ANGOLA ERIE COUNTY NEW YORK

O., is made manifest by the fact that the necessary fund of $5000 already is in sight. The club is going to send a delegation of riders to Buffalo, N. Y., during the meeting of the Motorcycle Manufacturers' Association, April 10, in an attempt to obtain the cooperation of that body.

New Official Repair Shops.

The following additions to the list of official repair shops have been made within the past few weeks: Girard Cycle Company, 140 North 14th street, Lincoln, Neb.; Motorcycle Shop, 124 Pearl street, Trenton, N. J.; Pinaire Bicycle Company, 917 East Douglass street, Wichita, Kan.; The Motoraid, 11 Jay street, Sacramento, Cal.; Motor Shop, Seventh and Main streets, Grand Junction, Col.; Hyatt W. Norton, East Bloomfield, N. J.; Hall Garage, Fort Collins, Col.; Charles F. Clements, 6004 Houston street, Pittsburg, Penn.; Kroeson & Plock, 506 North Main street, Streator, Ill.; Trieber Bros., 105 Grove street, Elgin, Ill.; Pierce Motorcycle & Supply Company, 703 Pike street, Seattle, Wash.; Miles & Schofield, 300 Fourth street, Olympia, Wash.; Fred Leves, 314 East Fourth street, Olympia, Wash.; W. G. Ashley, 313 Columbia street, Olympia, Wash.; Watt Shipp, 223 Commercial street, Salem, Ore.; S. P. Hunsaker, 220 West Third street, Pomona, Cal.; Frank Walling, East end, state road, Oneonta, N. Y.; A. B. Crosby, Aurora, Ill.; Twin City Motorcycle Shop, Colfax avenue and West Main street, Benton Harbor, Mich.; Greyhound Motor Company, 1443 Niagara street, Buffalo, N. Y.; Randall Manufacturing Company, 28 South Charles street, Baltimore, Md.

An Underslung Motorcycle.

A new machine called the Militaire has made its appearance in Cleveland, O. Among other things it has an underslung frame, thus bringing the centre of gravity very low and making for comfort and stability, according to the maker, the Militaire Company, 304 Columbia building. The new vehicle is presented in an accompanying illustration.

The elimination of the upper cross bar, characteristic of the diamond frame, permits of a bucket seat with back, which is suspended on a cantilever

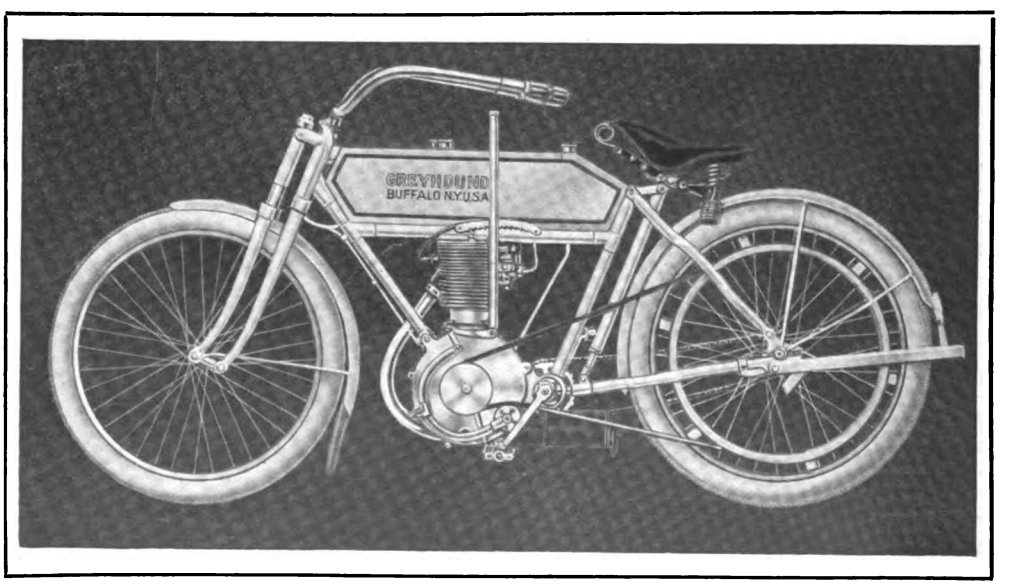
Digitized by Google

mechanism. The machine also has a steering wheel and column with spark and gas control. Another novel feature is the use of a friction drive, thus eliminating all gears and permitting of wide range in speed changes. Foot controls are provided for clutch, brake and speed changing. In addition idler wheels are utilized to preserve the equilibrium of the machine while standing, running at low speed or in sand. The wood road wheels have staggered spokes.

The Militaire, a Novel Two-Wheel Mount, Produced by Cleveland Concern.



The 1912 Greyhound.

The Greyhound Motor Company, Buffalo, N. Y., has found it necessaray to make a few radical changes in its product for the 1912 season. One of the most important features of this mount is the new Greyhound shock absorber, designed to dispose of the shock problem effectively and permanently. This, together with the cushion fork and 56-inch wheel is expected to insure stability and comfort to the rider.

The motor has a bore of 3.25 inches and stroke of 3.6875, bringing it to the limit of 30.50 inches, and is rated at 4.5 horsepower. The offset cylinder is placed slightly ahead of the main bearing, which is held to reduce greatly the amount of wear on the cylinder wall and the thrust of the rod on the main bearings. It is equipped with an automatic inlet valve, Breeze or Heitger carburetor, at the purchaser's option, and jump spark ignition is furnished as standard.

Lubrication is by gravity feed from a combination tank mounted in the upper panel of the frame. A sight feed glass is located just below the tank, while in the crankcase an oil window is placed where the level may be noted at all times. The oil is fed through the right crank bearing, from which it drains to a well beneath, afterward proceeding by a path, especially contrived, to the other bearing points, both centrifugal force and splash being utilized to lubricate the various bearings.

Enclosed flywheels, weighing 24 pounds and having the weight chiefly in the rims, make for easy starting and smooth running. The standard transmission equipment is a flat belt with hand operated idler. Double grip control is employed, with the connecting cables neatly passed through the handle bar tubes and frame head. Long handle bars, liberal mudguards and low saddle position add materially to the appearance of the new model, which is shown in an accompanying illustration.

The 1912 Greyhound 4.5 Horsepower Single with Interesting Shock Absorbing Device.

De Rosier Seriously Injured.

Motorcyclists generally will be extremely sorry to learn that Jacob De Rosier, the man who has made more world's records than any other rider, undoubtedly never will ride again. At present De Rosier is in a hospital in Los Angeles, Cal., with both knees broken and other severe injuries.

The accident occurred in a match race between

Digitized by Google

De Rosier and Charles Balke, both on Excelsiors, at the Los Angeles stadium, March 10. It was a two-mile event and Balke had secured the first heat. They were riding neck and neck when De Rosier attempted to pass Balke. The latter apparently lost control of his machine and rolled in front of his opponent, who was thrown several feet. For some unknown reason Balke was uninjured.

The accompanying illustration was taken less than an hour before the accident occurred and shows De Rosier at the height of his career as a motorcycle rider. He had expected to take part in the British Tourist Trophy event this summer, riding a foreign machine. Until recently his favorite mount was an Indian, and most of his records were made with a machine of that make. He has covered distances in less time than with his Excelsior, but some of these have not been accepted as official.

The summary of the meet in which the accident occurred follows:

Six miles, free-for-all—First, Ward, Indian; second, De Rosier, Excelsior; third, Balke, Excelsior; time 4:06.6.

Two miles, Class B—First, W. Samuelson, Indian; second, Humiston, Indian; third, Finkelstein, Indian; time, 1:28.

Three miles, Class B—First, W. Samuelson, Indian; second, Kittle, Merkel; third, Albright, Indian; time, 2:08.4.

Four miles, Class B—First, W. Samuelson, Indian; second, Kittle, Merkel; third, Albright, Indian; time, 3:02.4.

Two miles, Class A—First, Balke, Excelsior; second, De Rosier, Excelsior; third, Wolters, Excelsior; time, 1:23.8.

Two miles, match—First, Balke, Excelsior; second, De Rosier, Excelsior; time, 1:22.

Six miles, open—First, Ward, Indian; second, De Rosier, Excelsior; third, Balke, Excelsior; time, 4:06.6.

Two miles, match—Called off on account of accident.

Club Notes, Here and There.

The following clubs are considering the matter of affiliating with the national body: Motorcycle Touring Club of Maryland, Baltimore, Md.; Washington Motorcycle Club, Washington, D. C.; Black Hills Motorcycle Club, Deadwood, S. D.

These have affiliated with the F. A. M. recently: Temple Motorcycle Club, Temple, Tex., No. 229, C. J. Mitchell secretary, 20 members; Middleboro Motorcycle Club, Middleboro, Mass., 230, L. W. Bryant, 64 Forest street, 18 members; Ithaca Motorcycle Club, Ithaca, N. Y., 231, L. C. Morris, 300 East State street, 17 members; Olympia Motorcycle Club, Olympia, Wash., 233, M. D. Drake, Pioneer Iron Works, 17 members.

George C. Ladd, box 7, Vineland, N. J., circulation manager for the Evening Journal, has 30 local riders ready to form a club in the near future. All they want is a few more prospects.

Satisfactory progress in club promotion work is being done by the following: H. L. Jennison, Farnsworth, Kan.; Charles W. Von Parmalee, 408 Breckenridge street, Helena, Mont.; W. P. Smallwood, Culebra, Canal Zone; L. A. Wetmore, 514 Fairchild avenue, Kent, O.

Jacob De Rosier and His Excelsior, One Hour Before His Unfortunate Accident.

James A. Trent, Knoxville, Tenn., is taking a little time from his work as an advertising and printing expert to outline the policy for one of the liveliest F. A. M. clubs in the South.

W. E. Simons, box 171, Salem, Ore., reports that motorcycle interest is running high and that business is on the boom. There are between 40 and 50 riders in Salem and Mr. Simons will not be happy until he gets them organized into a club.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head, as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

Greenwood, S. C., has 30 riders and T. S. Chipley of that city is busily engaged as club organizer.

F. A. M. interests will be well looked after in Fort Recovery, O., where Henry Z. Fox is registering his repair shop and organizing a local club.

E. Ellsworth Alexander is promoting a club in Red Bank, N. J.

Carl A. Vogel of Albany, Ind., reports that he expects to have an affiliated club in existence in that town in the near future.

Taylor On Lake Erie.

Although spring has asserted itself in many places there is still plenty of snow in and about Angola, N. Y., where the Emblem mounts are made by the Emblem Manufacturing Company. An accompanying illustration shows L. S. Taylor, best known as an Em-

L. S. Taylor Taking a Spin on His Emblem, St. Patrick's Day.

blem racing rider, out for a ride in the snow on Lake Erie, St. Patrick's Day, March 17. During a large portion of the winter the surface of the lake has been covered with snow from two to four feet deep, and this has become a favorite speedway for the Emblem testers. Taylor has been spending the past few weeks at the factory, where they are extremely busy, a night shift having been placed at work recently in order to catch up with the orders which have been coming in since the new models made their appearance.

Harleys by the Carload.

Within a week W. J. Walker of Danvers, Mass., has placed an order with the Harley-Davidson Motor Company, Milwaukee, Wis., for a carload of Harley-Davidson machines needed in his territory. The same day a similar order was received from Weaver-Ebling, New York City, and yet another from the Appeal Manufacturing Company, Los Angeles, Cal.

Stadium Changes Hands.

P. L. Young, one of the best known racing promotors on the Pacific Coast, has purchased the interests of Jack Prince in the new stadium at Los Angeles, Cal., and will manage the track in the future.

DATING TIRES UNNECESSARY.

Recently, a bill was introduced into the New York State Legislature seeking to compel tire makers to date their product. Present information seems to indicate that the proposed law will meet with determined opposition in the Senate, although it has been passed by the lower branch. J. C. Matlick of the Ajax-Grieb Rubber Company, Trenton, N. J., maker of the Ajax tires thus express himself on the subject.

"The bill does not meet the approval of the manufacturer, because it imposes an unnecessary restriction on the trade, and furthermore creates a false impression in the minds of dealers and consumers. The average tire is not any less valuable because of six months' or a year's seasoning, and very likely is the better for it. Yet, the consumer looking at the date is bound to say: 'I don't want an old tire. Give me a fresh new one.'

"And the dealer, if he tries to say a tire is no worse for being a few months old, probably will have his statements accredited to self-interest. He will not want to carry stock if it must be dated and so the burden will come back on the makers.

"If this bill becomes law, it would make a complex and difficult situation. It is not needed. It does not serve the public interest, so far as I can see. The Motor & Accessory Manufacturers have canvassed the tire makers and finds a determined opposition to this measure."

SYRACUSE CLUB AND GOOD ROADS.

The Syracuse Automobile Club, Syracuse, N. Y., which is credited with 75 per cent. of the 90 miles of good roads in Onondaga county, is making preparations for an active campaign this year. The organization is co-operating with the Chamber of Commerce, although it is said the latter is working for good roads in the city while the motor club is promoting the construction of highways in the country. Among the accomplishments of the club was the building of an underpass in place of the grade crossing at Camillus, which will be constructed this year, and many miles of roads formerly of poor quality. Through efforts of the organization an eight-mile stretch connecting Marcellus and Marietta will be constructed shortly.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

The following companies have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

The Fairchild Electric Vehicle Company, Brooklyn, N. Y.; capital, $50,000; incorporators, Frank K. Fairchild, Marcus A. Fairchild, Arthur E. King.

The J. H. Kinney Company, Indianapolis, Ind.; capital, $10,000; incorporators, J. H. Kinney, H. L. Whipple, G. E. Snyder.

The Clifford Auto Company, Monticello, Ind.; capital, $15,000; incorporators, T. W. O'Connor, M. Clifford, E. J. Sexton.

Bristol Automobile Company, Waterbury, Conn.; capital not given; president, E. H. Bristol; treasurer, B. H. Bristol; secretary, B. B. Bristol.

Motor Car Specialty Company, Fort Worth, Tex.; capital, $5000; incorporators, E. E. Hose, F. H. High, R. R. Gilliland.

Elkins Automobile Company, Elkins, W. Va.; capital, $5000; incorporators, Thomas Donohoe, G. W. Adamson, E. O. King, E. D. Talbot, W. C. Poston, S. B. Hoffner, S. O. Billings.

The Wollaston Center Garage Company, Quincy, Mass.; capital, $25,000; incorporators, Albert C. Winsloe, Mabel McQuade, Charles C. Beatey.

The Jackson Petroleum Motor Company, Augusta, Me.; capital, $500,000; incorporators, E. M. Leavitt and others.

The Turnbull Auto Company, Willimantic, Conn.; capital, $25,000; incorporators, David A. Turnbull, Frederic J. Wood, William M. Turnbull, Alice Turnbull, Elizabeth G. Turnbull.

Excelsior Specialty Company, Jersey City, N. J.; capital, $30,000; incorporators, Ferdinand Thomassin, Frederick Lockwood, Albert Higson, Gustav H. Martens, Charles S. Goodfellow.

Harry F. Grant Company, Boston; capital, $50,000; incorporators, Harry F. Grant, Hugh Miller, William E. McKee.

Salem Automobile Service Company, Salem, N. J.; capital, $25,000; incorporators, George D. Jacquette, Ashton Lawrence, Clare E. Jacquette, William E. Allen.

Central Auto Supply Company, Indiana Harbor, Ind.; increase of capital stock to $600.

Stoddard-Dayton Motor Company, Hartford, Conn.; capital, $5000; incorporators not given.

Waterbury Automobile Company, Waterbury, Conn.; capital not given; president, Jennie S. Williams; treasurer, John T. Williams.

Bryant Sales Company, New York City; capital, $15,000; incorporators, William B. Haggerty, Frank P. Mansfield, 127 Duane street; Mary E. Wilson.

The Tire Trading Company, Wilmington, Del.; capital, $50,000; incorporators not given.

Monroe Garage Company, Monroe, N. Y.; capital, $3000; incorporators, William S. Jessup, Harriet S. Jessup, William F. Griffin.

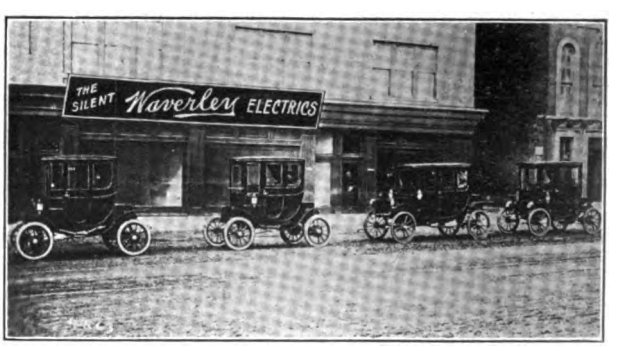
Springfield Auto Sales Company, Springfield, Mass.; capital, $35,000; incorporators, B. W. Ogg, F. T. Keisaker, L. S. Winegar.

Empire Automobile Company, Indianapolis, Ind.; capital, $100,000; incorporators, Cecil E. Gibson, A. Waldheim, David May, David Sommers, Charles B. Sommers.

Owens Wagon & Automobile Works, Charlotte, N. C.; capital, $50,000; incorporators not given.

Storm Motor Car Company, Wilmington, Del.; capital, $10,000; incorporators, Jules P. Storm, Charles M. Storm, W. I. N. Lofland.

Detroit Auto Training School, Detroit; capital, $5000; incorporators, Gaylord C. Brunner and others.



GARAGE AND DEALER.

Camp Bros., New Berlin, N. Y., are constructing a new garage. It will be of fire proof material, 60 by 90 feet, and will contain all modern conveniences to care for automobiles and repair work. G. E. Warner of the Post Garage, Catskill, will be head mechanic.

The Seymour Auto Company, Seymour, Conn., announces the opening of its automobile department in which modern conveniences have been installed for repairing motor cars.

Fred S. Willard and O. M. Decker, Utica, N. Y., have formed a partnership under the firm name of the Genesee Auto Sales Company and will conduct a general automobile business at 364 Genesee street. Both are experienced mechanics.

William Klokau, Davenport, Ia., who conducts a garage on 16th street and Fourth avenue, will construct a

Fleet of Waverley Electrics, Recently Shipped by the Waverley Company, Indianapolis, Ind., to Its Philadelphia Representative.

three-story brick building on the same premises. It will be modern in every particular.

The William J. Hawley Automobile Company, Canandaigua, N. Y., has purchased the Seaman Garage in Phenix street and will utilize the new quarters for repairing and storing. The new company is headed by Edson T. Case. William J. Hawley is manager.

Pray Brothers, Fort Dodge, Ia., is at the head of a company which has been formed to erect a new building in which will be installed modern machinery including an apparatus for welding automobile parts by the oxy-acetylene process.

Baumgardner & Kibby, Toledo, O., distributor for the Marathon, Detroiter and Cass cars, announces its removal into new quarters at 911 Jefferson avenue. A number of sub-agencies have been appointed and others will be made.

The Selden-Maxwell Auto Company, St. Joseph, Mo., announces the opening of new salesrooms at 910 Frederick avenue. The concern handles the Selden and Max-

Digitized by Google

well pleasure cars and the Sampson trucks as well.

R. L. Kampf has succeeded Kampf & Markland at Armington, Ill., as representative of the Cole, made by the Cole Motor Car Company, Indianapolis, Ind.

The Perry Motor Supply Company, Hartford, Conn., wholesale and retail dealer in motor car supplies, has opened a new store at 102 Allyn street.

The American-Cole Motor Company, Syracuse, N. Y., agent for the Cole and American cars, has moved into a new garage and salesrooms at 215 James street.

The Morris Motor Car Company, Waterloo, La., is erecting a two-story brick garage on East Fifth street. The structure will cost in the neighborhood of $12,000 and will provide a salesroom 30 by 48 feet which will be located on the ground floor. The upper floor will be utilized for a repair shop and storage.

Albert H. and John F. Lohrman, Cincinnati, O., have formed the Cole Motor Sales Company and will distribute the Cole in that city and surrounding territory. The salesroom will be located at Peebles Corner.

The White Motors Company, New Haven, Conn., of which W. A. Rutz is manager, has made application for an increase in capital stock from $5000 to $20,000, this step being necessary owing to the increase in business.

Peter C. Rutan, a well known automobile dealer of Port Jervis, N. Y., has purchased properties on Ball street, and will erect a two-story concrete garage, 25 by 100 feet, which will be an addition to the present building.

The P. N. Montague Garage was opened recently in Charlotte, N. C. The structure is 110 by 180 feet, located on Main street, and is equipped with modern conveniences for the care and maintenance of motor cars.

Fred Seegar, Marion, Ind., has established a garage at 10th and South Washington streets, and will conduct a general storage and repair business.

Stahl & Stone, Topeka, Kan., agent for the Cole line, are occupying new quarters at 621 Quincy street.

George D. Jarvis, Burlington, Vt., is erecting a two-story garage of fire proof material on South Winooski avenue. The structure will be 56 by 130 feet and will be known as Jarvis' Palace Garage. The garage proper will be at the rear and will be fitted with modern equipment throughout.

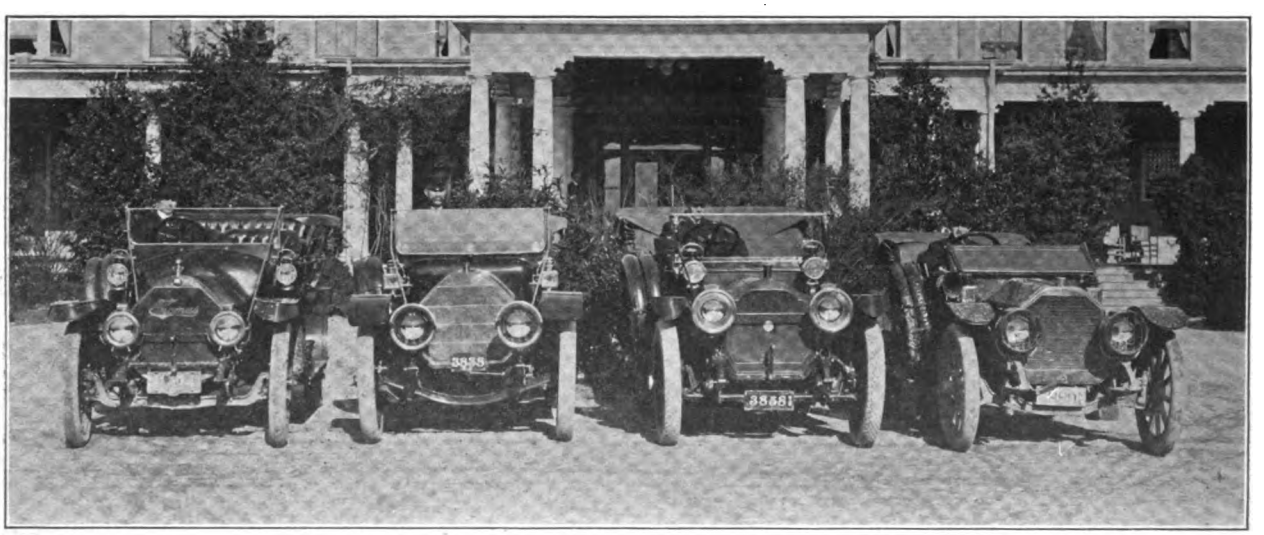
The New Bedford Auto Selling & Supply Company, New Bedford, Mass, is occupying new quarters in the Coffin building, Spring and Pine streets. The concern is agent for the White line, made by the White Company, Cleveland, O.

The Means Auto Company, Des Moines, Ia., is occupying new quarters on 12th street, the change being necessary owing to a rapidly increasing business.

Holloway & Naville have succeeded Bryant & Holloway at Lafayette, Ind, Clarence Naville having acquired the interests of E. L. Bryant. The garage is located at 210 Columbia avenue.

Charles Schuster, for two years sales manager for the Cadillac in Cincinnati, O., has resigned to accept a similar position with the Cole Motor Sales Company of that city.

Joseph W. Rice, Gloucester, Mass., is erecting a new garage which will provide accommodation for a large number of machines.



Staacke Bros., San Antonio, Tex., has dissolved, A. E. Staacke retiring. The business at 135 West Commerce street will be conducted hereafter by H. G. Staacke.

V. Durand, New Orleans, La., agent for the Amplex, made by the Simplex Motor Car Company, Mishawaka, Ind., has appointed the following sub-agents: Tartimer & Boudreaux, New Orleans; Thibaut & Leblanc, Klotzville; J. U. Folse, Paincourtville; Emile Dupont, Houma; G. W. Leah, Morgan City.

WITH THE MANUFACTURER.

Earl Chambers of Danville, Ill., has closed his garage and salesroom and accepted a position with the Chicago branch of the Velie Motor Vehicle Company, Moline, Ill.

The Henderson Motor Sales Company, Indianapolis, Ind., distributor for the Cole product, announces the appointment of the following new agencies: Cole Motor Sales Company, Cincinnati, O.; William E. Bell, Little Rock, Ark.; Mt. Lebanon Auto & Repair Company, Mt. Lebanon, Penn.; R. H. Pierpont, North Haven, Conn.; T. Williams, Canal Dover, O.; Crescent Garage Company, Odgensburg, N. Y.; J. H. Brown, Eveleth, Minn.; G. E. Sullivan, Oregon City, Ore.

Motoring Is Popular at Pinehurst, N. C., a Winter Resort, Owing to Many Beautiful Runs in and Around That Place—The Machine at the Left Is a Thomas, Owned by Leonard Tufts, Prominent in Good Roads Movement in the South.

The Abbott Motor Company, Detroit, announces the appointment of the following agencies: Missouri Motor Car Company, St. Louis, Mo.; W. D. Rightmire, Duluth, Minn.; D. B. Smith Auto Company, Burlington, Ia.; J. H. Fox, Grand Rapids, Mich.; E. F. Shriver, Benton Harbor, Mich.

Lucius A. French, advertising manager and assistant secretary of the Henderson Motor Sales Company, Indianapolis, Ind., has resigned from that company to become advertising manager for the Eller Music Houses, and left for Portland, Ore., recently. His many friends tendered him a banquet before his departure.

Edgar E. Muller has been appointed manager of the recently established service department of the Ohio Motor Car Company, Cincinnati, O. Mr. Muller has been connected with the company since its inception.

Reo Automobiles, made by the Reo Motor Car Company, Lansing, Mich., of which R. M. Owen & Co., New

Digitized by Google

York City; is general sales agent, played an important role in a rabbit hunt conducted by 14 Reo enthusiasts at Cheney, Kan., recently. The hunt lasted two days and that the motorists were successful will be seen by the accompanying photograph which depicts a portion of the 1718 rabbits killed.

The Lininger Implement Company, Omaha, Neb., announces that its annual automobile accessory catalogue is ready for distribution and copies will be mailed free upon application.

H. C. Lathrop, secretary and treasurer of the Henderson Motor Sales Company, Indianapolis, Ind., and Miss Julia V. Hyland, a prominent Youngstown, O., society girl, were married in that city recently during the automobile show. They will reside in Indianapolis.

Alden L. MacMurtry has resigned his position with Gray & Davis, Amesbury, Mass., manufacturers of automobile lamps and an electric lighting dynamo. He will devote his entire attention in the future to the Mondex specialties handled by the Aristos Company, New York City.

Leonard Tufts of Pinehurst, N. C., who is prominent in the good roads movement in the South, is a Thomas enthusiast and in the accompanying illustration is shown the machine in front of the Carolina previous to its departure on an all day run. Motoring is extremely popular at this winter resort as there are numerous triangular runs of which Pinehurst is the starting point.

Motorists in Cheney, Kan., Utilize Automobiles in Hunting Rabbits—The Picture Depicts the Result of a Two Days' Hunt in Which Reo Cars Played a Prominent Part.

The Findeisen & Kropf Manufacturing Company, Chicago, announces that the Hall Motor Supplies Company, Toronto, will act as distributor for the Rayfield carburetor in Canada. The R. C. Hull Electric Company of Cleveland, O., will also handle the Rayfield.

The New York Lubricating Oil Company, consolidated with the Columbia Lubricants Company of New York, has found it necessary to open a branch office at Seattle, Wash., at the corner of Virginia and Railroad avenues, owing to the large increase in business on the Pacific Coast. A new and larger warehouse has been secured in Newark at 3739 New Jersey railroad avenue.

D. H. Wetzel, for the past year or more advertising manager of the Ajax-Grieb Rubber Company, has resigned to become advertising and sales manager of the Maple Products Company, Utica, N. Y. He assumed his new duties March 15.

Williams & Co., New England agent for the Cartercar, made by the Cartercar Company, Pontiac, Mich., is occupying new and more commodious salesrooms at 1000 Boylston street, Boston, where a full line of the product of the Pontiac concern will be shown.

The Northwestern Chemical Company, Marietta, O., maker of "The Chemically Correct Line," is mailing its 1912 catalogue of motor car specialties.

The Blood Bros. Machine Company, Kalamazoo, Mich., maker of universal joints, announces the operation of its plant 23 hours a day in order to handle its increased business. During the past six months the company has doubled its plant and even with the additions and special machinery finds it difficult to keep up with its orders.

The Kissel Motor Car Company of Hartford, Wis., has completed negotiations for a new home for its New England branch, and will erect a building 74 by 200 feet on Commonwealth avenue at Pleasant street, Brookline, Mass. When completed it will be one of the finest structures of its kind in New England and will have a salesroom 74 by 70 feet. The garage will occupy the rear of the first floor and the most modern appliances will be installed for the care and maintenance of motor vehicles. Manager H. B. Pruden has provided a room for the chauffeurs directly off the garage. The service shop will be located on the second floor, rear, and the machinery will be operated by electricity. A trolley system will be installed for handling heavy parts, also a large hydraulic elevator. The front portion of this floor will be utilized for the display of trucks.

The Thomas B. Jeffery Company, Kenosha, Wis., announces that plans have been completed for the erection of the new Rambler sales and service building in the newer Back Bay district of Boston. It will be four stories in height, of fire proof material and will be 216 by 127 feet, providing about 60,000 square feet of floor space. Work has begun upon the Chicago service station which is located at the corner of Indiana avenue and 23rd street. Both properties have been leased for a term of years.

Waverley electrics, made by the Waverley Company, Indianapolis, Ind., and other electric pleasure vehicles were extensively advertised by the dealers in that city recently and the advantages of these machines for city and suburban service emphasized. The campaign had been in progress but a few weeks when the Philadelphia representative of the Waverley Company placed an order for four cars. In the accompanying illustration is depicted the automobiles in front of the salesrooms at 2029 Market street. One of these is a Silent Waverley limousine five-passenger car in which all seats face forward.

Digitized by Google

NEW YORK DEALERS ON LEGISLATION.

The Automobile Dealers' Association, Inc., of New York City, has been decidedly active in guarding the interests of motorists during the present session of the New York Legislature. It is probable that the decision of the political leaders at Albany to permit the so-called Callan law to remain unchanged for at least another year, is due in a large measure to the action of this organization.

The first bill introduced was that which provided for a signalling device at the rear of the car which would show all those following that the driver intended to slow down or stop. There may have been some merit in a device of this nature, but to make its adoption compulsory was considered an unwarranted hardship, and the result would have been to close the commonwealth to tourists.

Senator Long introduced two bills, the first of which provided for a division of fines collected from motorists between the state and the cities or villages collecting them. When the association showed that this would mean the establishing of speed traps throughout the entire state, the bill was withdrawn. The second provided for a similar division of the registration fees, and when it was shown that New York City would receive 70 per cent. of the money, leaving but 30 per cent. to be expended in the rest of the state, this also was withdrawn.

At the same hearing, there appeared a bill introduced by Senator Bussey, providing that "no chauffeur's license shall be issued to a person who has been convicted of a felony." This was opposed on the ground that it was class legislation, and that if such a law were passed, it should be made to apply to teamsters, motormen and all other classes of trade.

Another bill was introduced by Senator McManus, this prohibiting racing on either track or highways. This was opposed, not only by this association, but by the American Automobile Association and other organized bodies of motorists. It was pointed out that these organizations were engaged in formulating rules which would eliminate possible dangers, and the proposed legislation was entirely unnecessary.

NEW WASHINGTON CONCERN.

The Washington Motor Car Corporation has been organized in Washington, D. C., for the purpose of taking over the business of the Carter Motor Car Company of that city. The new concern will manufacture a full line of four and six-cylinder automobiles. The directors include: W. D. Barry, Louis S. Kann, W. L. Bowles, Dr. John R. Sharp, Dr. H. M. Dixon, Hugh F. Harvey, J. D. Darnall, Thomas F. Murphy, P. M. Galvin, M. H. Herriman, W. K. Hill, Samuel Gassenheimer, C. C. Gove, Dr. Thomas E. Latimer, Washington; Dr. Guy Latimer, W. P. Magruder, J. F. Lillard, Hyattsville, Md.

VALUE OF SERVICE STATIONS.

That automobile manufacturers are learning intrinsic value alone cannot be relied upon to create and maintain a demand for a product, is the opinion of C. P. Henderson, president of the Henderson Motor Sales Company, the Indianapolis organization that markets the Cole car, made by the Cole Motor Car Company of that city. He feels that the successful manufacturer of the future will be the one which follows up the right kind of advertising with the establishment of service departments for the benefit of users. He says:

"Owners are coming to see that it is a reckless waste to trade in their cars each year at such a heavy loss, when by taking proper care of their machine, and with the help and support of the manufacturer, years of use can be had with the minimum cost of upkeep. By rendering the proper support to the user the manufacturer secures his hearty indorsement. which will in a measure solve the second hand car problem. In fact, a rightly conducted service department can well be maintained in connection with the sales department, if the distributors and agents are brought to the proper kind of co-operation, and may easily become the most efficient part of the selling organization."

WARREN DOUBLES CAPITAL.

The Warren Motor Car Company, Detroit, maker of Warren cars, has increased its capital from $300,000 to $600,000, this step having been necessary because of rapidly increasing demands for its product. Lucius E. Wilson, retiring secretary of the Detroit Board of Commerce, has become vice president and general manager of the company with complete command over the production facilities.

TOURING CALIFORNIA IN THE R-C-H.

Three thousand, one hundred and sixty-nine miles in 15 days at a total cost for gasoline, oil, tires, etc., of $65, or about two cents a mile, is the result obtained by an R-C-H two-passenger roadster, made by the R-C-H Corporation, Detroit, in the hands of R. C. Luther. The car was selected for the purpose of distributing literature concerning the Panama-Pacific exposition.

During its tour the R-C-H visited every town between San Francisco and Redding on the north and between San Francisco and Santa Cruz on the south. It also covered the San Joaquin valley from Stockton south to Porterville and Hanford. Plans are now under way for sending the machine across the continent in the same interests.

The story of the trip has been compiled in an interesting booklet, which the R-C-H Corporation is sending free to all who make request at the main office of the concern, 107 Lycaste street, Detroit.

Digitized by Google

MUFFLER CUT-OUT UNNECESSARY.

The indiscriminate use of the muffler cut-out has caused a very decided public sentiment against it recently, and several well known motor car manufacturers have been making exhaustive tests to determine whether or not efficiency is marred by its omission. Among these is the E. R. Thomas Motor Car Company, Buffalo, N. Y., maker of Thomas cars. Concerning the result of these tests. President F. R. Humpage says:

"In the early days, opening the cut-out gave increased power and speed with the free exhaust, but today, with the improvements in motors, mufflers and exhaust manifolds, there is no excuse for the flagrant disregard of the uses for which the cut-out was designed. Prospective purchasers and dealers have demanded a cut-out in the past, although our officials always have been opposed to it. We believe that when one is installed, it should be placed in such a position as to require the driver to deliberate before using it."

An ordinance has been introduced in New York City, prohibiting the use of this member, and public opinion has been aroused to such a point that it is probable the ordinance will pass in the near future.

MOTORING IN NATIONAL PARKS.

Senator Warren of Wyoming has introduced a resolution in Congress calling upon the secretary of the interior to submit complete information regarding the national parks in which motor driven vehicles are permitted, and asks what can be expected in the way of opening Yellowstone and other national parks which now forbid their use. The explanation that the roads must be widened before motor vehicles are admitted is an answer which does not find complete acceptance from those who contend that conditions can be adjusted to meet present day road travel.

TWELVE CARS IN 500-MILE RACE.

The 12th entry for the 500-mile race on the Indianapolis speedway, Memorial Day, has been made by the Clarke-Carter Automobile Company, Jackson, Mich., with a Cutting car, which will be driven by Robert Burman. Harry Goetz, who was mechanician for Ray Harroun, winner of last year's 500-mile race in a Marmon car, has gone with Burman and is helping him in the construction of the special racing machine. This will be equipped with a four-cylinder motor, having bore of 5.21875 inches and stroke of seven inches, giving a piston displacement of 597.9 cubic inches.

The other entries are: Two Stutz cars to be driven by Gilbert Anderson and Leonard Zengle; two Nationals with Donald Herr, Howard Wilcox or Charles Merz; two Case cars, with Harvey Herrick and Louis Disbrow; two Mercedes, with Ralph De Palma and Spencer Wishart; a Fiat, with Teddy Tetzlaff; a Simplex, with Bert Dingley, and a Lexington, with Harry Knight. Ralph Mulford has purchased a six-cylinder Knox which he will drive in the race, although his formal entry has not been filed as yet.

REMY BRASSARD IN HAVANA.

The recent suspension of E. A. Moross by the contest board of the American Automobile Association appears not to have affected his plans for holding a race meet at Havana, Cuba, March 10. One of these races was for the Remy grand brassard, which has been awarded for contests over American tracks in the past. This was won by Robert Burman, driving the Ohio car 999, made by the Ohio Motor Car Company, Cincinnati, O.

LARGE ABBOTT-DETROIT ORDER.

Train load shipments of motor cars from Detroit are common nowadays, when formerly they would have attracted attention. It is a frequent occurrence for a motor car company to receive large orders for machines and an instance of this kind is noted with the Abbott Motor Company which recently received an order for 300 automobiles to be shipped to New York City. If this order were filled at one time it would require four trains of 30 cars each.

AS TO IMPORTS AND EXPORTS.

For the first time in many months the report of the Department of Commerce and Labor for January, 1912, shows an increase in the value of automobiles and parts imported into this country from abroad. The totals for this month in 1911 and 1912 are, $171,301 and $224,342, respectively. During the same period the exports increased a little more than 87 per cent., or from $1,300,668 in 1911 to $2,427,891 in 1912. Classified according to countries the result is as follows, with respect to automobiles:

Exports

	1911		1912	
Country	No.	Value	No.	Value
United Kingdom	..	$194,589	719	$508,324

The Quality Lubricants

HARRIS

TRADE MARK—REG. U.S. PAT. OFF.

OILS

You get greater mileage out of HARRIS OILS because they are ALL lubrication—there is no waste. This is an established fact—not an advertising claim. No other lubricants are made with the same conscientious care.

We take pride in our product. We don't try to make as much as we can, but the best. That principle of manufacture has placed HARRIS OILS in the front rank.

We buy the finest grade of Pennsylvania Crude—what is called "Premium" Crude. We pay a premium to get this particular stock and we won't use anything else.

That is why HARRIS OILS cost considerably more to manufacture than ordinary oil. That is why they are best—surely you realize the absolute necessity of giving your engine the highest grade of lubricant the market affords. Nothing else compares with HARRIS OILS. Get a package today. You'll be more than pleased.

Made in three bodied consistencies.

LIGHT, MEDIUM, HEAVY. Sold in barrels, 1-2 barrels, two 5 gallon cans in wood case, single 5 gallon can cased, and 1 gallon cans. Ask your dealer or garage man.

Ask for HARRIS OILS. If your dealer does not sell them, send 80 cents (for 1 gallon can) or $3.75 (for 5 gallon can) and we will ship same prepaid.

A. W. HARRIS OIL COMPANY

326 South Water Street, PROVIDENCE, R. I.

143 North Wabash Avenue, CHICAGO, ILL.

SAVANNAH ABANDONS RACING CLASSICS.

At the recent annual meeting of the Savannah Automobile Club, Savannah, Ga., it was decided that the organization would not take the initiative in promoting the Vanderbilt Cup and Grand Prize races this year. This does not mean necessarily that these classic events will not be held over the southern course, but it does mean that the club will not bear the entire burden of the undertaking and that other interests will be compelled to take the first steps. From present indications, it would appear that these races will be held elsewhere.

NEW CARTERCAR CHICAGO HOME.

With the largely increasing business of the Cartercar Company, Pontiac, Mich., maker of Cartercars in Chicago and the Middle West, it has become necessary for the company to secure larger quarters for its Chicago branch. A beautiful new building, three stories in height, is to be erected at 1840 Michigan avenue, in the heart of the automobile district, and will be occupied exclusively by the Cartercar Chicago branch. The first floor will serve as a salesroom, while the second and third will be utilized for a service station. A complete stock of repair parts will be kept on hand continuously, and the trade throughout the entire section will be supplied with cars and parts from this branch.

FOREIGN OVERLAND AGENT.

Claude A. George, assistant sales manager of the Willys-Overland Company, Toledo, O., maker of Overland cars, left New York City on the Lusitania, March 20, bound for Hamburg, Germany, where he will locate permanently as Continental representative of the company. Mr. George has been associated with the Willys-Overland Company since the early days of its existence, and expects to be able to increase greatly the concern's foreign business during the coming year.

SEEK BOARD TRACK MEET.

Motor enthusiasts in Los Angeles, Cal., are planning to hold an automobile race meet on the board track at Playa del Ray, following the Santa Monica road race of May 4. It is understood that application will be made for a sanction in the near future. There seems to be no reason why the plan should not prove of value in promoting the road event, since it is expected that many manufacturers, who might hesitate about sending cars to the Pacific Coast to participate in only one race, will be glad of the opportunity to take part in both meets. Long distance contests on the board track probably will be eliminated, the longest undoubtedly being for 25 or 50 miles.

This sign on your window will sell many a Tuto for you

Our large "Auto Supply" window sign, advertising and cut service is ready to be sent to the dealers who sell the

TUTO HORN

A Two-Tone Electric Horn

The TUTO Horn easily outsells any horn line. Probably no warning signal was ever accorded such prompt endorsement by car drivers everywhere as the TUTO. The mechanical construction and ease of operation were in a great measure responsible, as these features at once placed the TUTO in a class by itself.

It's the only electric warning signal made with a low note for regular service and a loud note for emergency, both operated from the one push button, the one connecting cord and one set of batteries.

Send your order today for TUTO Horns. Get one of our large window signs, *which essentially is your sign.* Make use of our advertising and direct TUTO Horn buyers to your store.

It will be the most profitable trade winning investment you ever made. Act today.

DORIAN

"On Again-Gone Again"-DORIAN

DEMOUNTABLE RIMS

Just loosen Four nuts (with only a wrench and your hands) OFF with the damaged tire and rim—ON with the spare—TIGHTEN the four nuts—and you're GONE AGAIN.

Your car can be easily equipped with

DORIAN RIMS

by any wheelwright —DO IT NOW— or if you are purchasing a new car, it will be fitted by the manufacturers—if you *insist*.

TRADE K-W MARK

Master Vibrator

for all cars using vibrating spark coils and **ESPECIALLY FOR**

FORD CARS

You will never know how much

Speed, Power and Flexibility

there is in your Ford Car until you install a K-W Master Vibrator.

PRICE $15.00

Express prepaid when cash accompanies the order.

The K-W Master Vibrator does away with the separate vibrator adjustment on your coil, giving you one fast vibrator and powerful condenser for all of them, thus giving absolute synchronism, with a smoother running engine. It makes the hills "fade away."

Try it 30 days and if you even feel that you can do without it, return it and get your money.

Special Electric Lighting Outfit, with complete headlamps for Ford Car, $15.00

We also make Magnetos and Spark Coils.

SEE ADDRESS IN THE CIRCLE ABOVE

Thirty Thousand Miles!

Read the letter quoted below. It outlines one of the many wonderful performances of the

HERZ PLUG

"BOUGIE MERCEDES"

There is more real service in one Herz Plug than in three or four of the ordinary kind.

D. F. WILCOX

Fall River, Mass., Feb. 9, 1912.

HERZ & CO., New York, N. Y.,

Dear Sir:—I have been using a set of your Bougie Mercedes plugs for two years in the same machine, during that time **the machine went thirty thousand miles** and I wish to tell you that **the plugs were never touched and are still running** as well as ever. I have sold the machine and of course the plugs went with it.

Yours truly,

(Signed) Samuel E. H. Wilcox.

$1 50 *GUARANTEED A FULL YEAR* **$1 50**

As a matter of fact, the **Herz Plug** will give perfect service for much longer than that. It is Double Stone. It is self-cleaning—cannot foul. The sparking points are platinum-alloy, and will not burn away. And remember the 4-point, rolled-in disc.

At Your Dealer's, or **HERZ & CO.,** 295 Lafayette St., New York

Ask for the BLUE Enameled Stone.

NEWTONE

The Mile Away Electric

MOTOR HORN

Patented Sept. 5, 1911

Torpedo Type

PRICE

$20.00

Including Button and Cable

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

NEW TYR

a waterproof
tire dressing
that beautifies
the car and preserves

THE TIRES

Far superior to any other preparation on the market for the two-fold purpose of dressing and preserving tires A rubberized liquid preparation that fills the cracks and holes, prevents sand blisters and keeps the rubber from cracking. New Tyr can also be used on running boards and floor of car if desired with a very dressy effect. Uninjured by temperature or weather—water has no effect upon it. NEW TYR stays put and is applied in the same manner as paint.

Try a pint can of NEW TYR—it means a better looking car and better tires, covers more surface and is far superior to any other preparation on the market. Used in Germany and European motoring countries for years.

PRICE OF PINT CAN, 75c.

A NOISE ANNOYS

Stop that noise; get away from friction and wear; there's no need of these drawbacks to motoring. An adequate lubricant greatly reduces friction and gives you the full driving power of your engine.

It's your gears that you must look to for successful motoring, and it's a "gear" oil you MUST have. Only

INVADER GEAR OIL

is "adequate"—made for gear needs. Tests have proved its superiority, and testimony its popularity. Up-to-date dealers and owners are its enthusiastic users for sliding gear transmissions, differential gears and front gears where a heavy lubricant is required.

April 10, 1912

No one lubricating oil is best for all cars. This is absolute.

NO one would think of using the same lubricant for a sewing machine and a battleship.

The needs of two motor cars often differ quite as widely.

The correct oil for a Fiat, for instance, is absolutely the wrong oil for a Packard.

The spring-strength of the piston rings must be considered; the fit of the piston ring into its recess; the length of the crank-shaft and connecting-rod bearings; the feed-systems; the length of the vacuum period, while intake and exhaust valves are both closed.

Before anything like correct lubrication can be determined, these, and other important considerations, must be known and studied.

In planning for a complete range of automobile lubricants, we first analyzed the construction of every domestic car and practically every foreign make.

Altogether we found that they required five distinct grades of lubricating oil. We then produced the oils.

So far as it was practicable, we filtered out the free carbon.

We verified the fitness of these oils by frictional horse-power tests on many cars they were intended for.

All the oils were put through practical demonstrations on their respective cars.

The test-results called for some changes, which we made.

Our ultimate findings are printed in a list of recommendations showing the correct grade of oil for every American car and many of the foreign makes. We will send copy of this list on request.

Some cars change type from season to season. The list gives the oil required for each season's type.

Mobiloil

If oil saves power, it follows that one oil saves more power than another.

1912 Annual Catalog No. 22

Our 1912 Catalog, the Largest and Most Complete Catalog of the kind, containing 256 Pages, is Now Ready for Distribution. The Circulation is Limited to ONE HUNDRED THOUSAND Copies. It will be mailed to any one on request.

CUT PRICES

Concerns that offer Large Discounts make it their practice to INFLATE LIST PRICES and then offer Large Discounts, which are somewhat misleading. We have seen a catalog in which a certain spark plug is illustrated, "PRICE $2.50, OUR PRICE $1.00," while THE STANDARD LIST or RETAIL PRICE for the same spark plug as illustrated in Our Catalog and advertised by the manufacturer is $1.00 each. Their CUT PRICE Therefore Is Not Lower Than OUR LIST PRICE.

DON'T BE DECEIVED BY LARGE DISCOUNTS QUOTED FROM INFLATED LIST PRICES . . . .

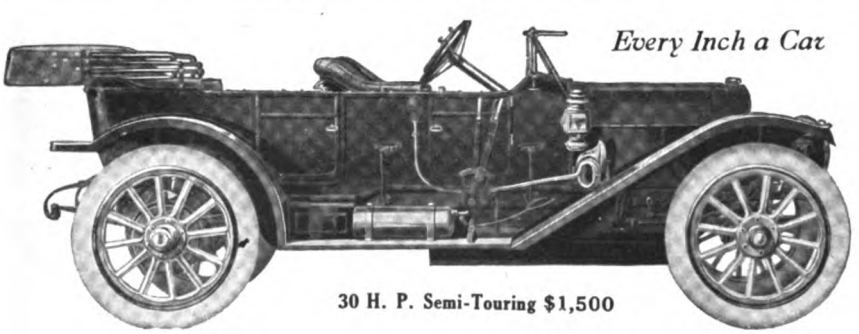
THE "BALANCE" OF THE KISSELKAR

30 H. P.....$1500
40 H. P.....$1850
50 H. P.....$2350
60 H. P. "Six".....$3000

Except the "Thirty," prices include full equipment.
1½-2 ton, 3, 4, 5 ton Trucks, Delivery Wagons, etc.



NOTHING contributes so much to comfort, easy handling, low maintenance and long life of an automobile as perfect "balance," which, first of all, is the proper relation between wheel base and the proportions and weight of the body. Crowding a four and five passenger tonneau on a contracted wheel base is unmistakable evidence of cut-cost manufacture.

KisselKar wheel bases are equal to the wheel bases of more expensive cars, and more liberal than the wheel bases of any other cars approximating KisselKar prices. This perfect "balance" of the KisselKar and the big wheels, big tires and commodious tonneau, place the KisselKar in the small class of better automobiles.

Sounds Like An Irish Bull

We charge the *least* for the Stewart Speedometer because it's the *best* speedometer. Sounds like an Irish Bull, doesn't it? But the argument is sound.

The better an article the better it pleases users. The better it pleases users the larger its *sale*. The larger its sale the less the cost of *producing* it. For the oftener a machine is used the less is the machine charge on each part it makes.

A smaller *cost* makes a bigger demand—and a bigger *demand* makes it easier to install *still* faster and *better* machinery.

That's the story of the Stewart Speedometer. That's why we can afford to make the finest speedometer on earth and ask the least for it.

It's the best ever *known;* but the *price* hasn't grown.

Not an *aristocrat*—it *works*.

Magnetic principle—jewel bearings—wearing parts hardened and polished; open dial—large figures, easily read—absolutely accurate; 100,000-mile season odometer, 100-mile trip register, can be reset to any tenth of a mile. Guaranteed for five years. Strongest flexible shaft—drop forged swivel joint—noiseless gears.

"ALWAYS ON THE JOB."

Speedometers, $15 to $30
Rim Wind Clock Combinations, $45 to $70

IN CANADA ADDRESS

Russell Motor Car Company at Montreal, Toronto, Winnipeg, Hamilton, Calgary, Vancouver, and Melbourne, Australia. Others Being Established.

Why bother with old and unsatisfactory ignition? Why pay repair bills on your magneto when you can get a brand new Remy Magneto, efficient under all conditions, for less?

You can help bring the old car back to its former efficiency.

You can have in new and improved form the magneto that has helped win the world's greatest races; that is standing up year after year under the "gaff" of daily service on over 250,000 cars. The new

Remy Magneto

is lighter in weight, smaller in size and fully fifty per cent more efficient electrically. The product of the best brains engaged in ignition designing, it is the highest development of the Inductor Type, the key to the great Remy success.

Instead of miles of wound wire revolving in limited space, making insulation almost impossible; instead of wiping contacts, delicate springs and frail brushes and rings, this machine has laminated steel inductors revolving around a stationary winding. As simple as a monkey wrench! Just as efficient at slow speed as at seventy miles per hour. Starts on a quarter turn.

Every Motorist Should Read This Money-Saving Proposition

The simplicity of Remy Magneto construction, coupled with unequaled buying and manufacturing facilities, enables the World's Largest Magneto Manufacturers to make you this remarkable offer:

	List Price	Allowance	Net to You
2-Cyl. Remy Magneto with coil, complete	$46.00	$9.20	**$36.80**
4-Cyl. Remy Magneto with coil, complete	50.00	10.00	**40.00**
6-Cyl. Remy Magneto with coil, complete	52.00	10.40	**41.60**

Allowance is for old equipment *(regardless of make)* that you are now using.

Write, phone or call on nearest Remy Branch or "Remy Service Station" for full information. Ask for the "Mirror Booklet," if you want the "how and why" of the magneto in plain English.

This Lighting System Solves Every Lighting Problem

GRAY & DAVIS

Lighting Dynamo System

Every possible lighting contingency is properly taken care of in this system. The foundation is CONSTANT SPEED, which prohibits the voltage from varying. It lights lamps without the battery. Furnishes full current whether you run the car all day and little at night or mostly at night and seldom by day. Maximum light—or just a touch of brilliancy directly before the wheels. All your lamps or part of them.

No other lighting system in the world, can accomplish these things. Therefore your selection must be GRAY & DAVIS.

No-Rim-Cut Tires

10% Oversize

Adopted by 200,000 Owners and by 127 Makers of Cars

In March the sales of Goodyear automobile tires will reach the million mark.

That means that these tires have been tested out, probably, on 200,000 cars.

The result is this:

No-Rim-Cut tires—our patented type—now far outsell any other make of tire.

127 leading makers of cars have contracted this year for the Goodyear tire.

In two years the demand has multiplied by six. It is three times larger than one year ago.

Save 48 Per Cent

Statistics show that 23 per cent of all ruined clincher tires are rim-cut.

Clinchers are the old-type tires—the hooked-base tires—which No-Rim-Cut tires are displacing.

Experience proves that 10 per cent oversize, under average conditions, adds 25 per cent to the tire mileage.

No-Rim-Cut tires make rim cutting impossible.

They are more than 10 per cent oversize. Comparison with the five leading makes of clinchers shows the average oversize 16.7 per cent.

Tens of thousands have proved that these two features together actually cut tire bills in two.

No Extra Price

These patented tires used to cost one-fifth more than other standard tires. Now they cost but an equal price.

Thus the saving is clear.

That is why 200,000 men who know have come to this new-type tire.

We Control It

Our Tire Book explains why our patented features are essential to this type of tire.

Other devices, used to meet our competition, have proved most unsatisfactory.

That is why the demand for this new type centers on Goodyear No-Rim-Cut tires.

You are bound to adopt No-Rim-Cut tires when you find them out. In the meantime you double your tire cost.

GOODYEAR

No-Rim-Cut Tires

HARRIS

TRADE MARK—REG. U.S.PAT. OFF.

OILS

Actually Save You Money

THE SAVING is in the increased mileage they give. There is more lubrication in every drop of HARRIS OILS than there is in ordinary lubricants.

THE SAVING is in the reduced cost for upkeep. Remember that the soot-deposit ingredients are eliminated to the greatest possible extent. This naturally reduces chances of carbonization. There is less cost for repairs and overhauling.

THE SAVING is in the absence of lubricating troubles. Your engine runs smoother—no knocking or pounding, no constant grinding of valves.

It costs but little—a trifle to prove the efficiency of HARRIS OILS. One or two cans tell the story more graphically than thousands of advertisements.

If you, too, believe HARRIS OILS will save you money and give you a better motor—why not try them?

If your dealer does not sell Harris Oils, send 80 cents (for 1 gal. can) or $3.75 (for 5 gal. can) and we will ship same prepaid.

The 25-Year Car

By R. E. Olds, Designer

I have spent 25 years in building automobiles. All I have learned is embodied in Reo the Fifth.

This splendid car, in every detail, marks the best I know.

If any man can build a car better he is a better man than I.

My Limit

The steel in this car is all analyzed to know it accords with my formulas.

The gears are tested in a crushing machine with 50 tons' capacity.

The carburetor is double heated—with hot air and hot water.

Roller bearings—Timken and Hyatt—take the place of ball bearings.

Tests and inspections, in every step of the making, are carried to extremes.

The margins of safety are much larger than usual.

The wheels are large, the tonneau is roomy, the car is over-tired.

The body finish consists of 17 coats. The lamps are enameled. The engine is nickel trimmed.

The upholstering is deep. It is genuine leather, filled with hair.

Inside and outside, regardless of cost, here's the best car I can build.

Center Control

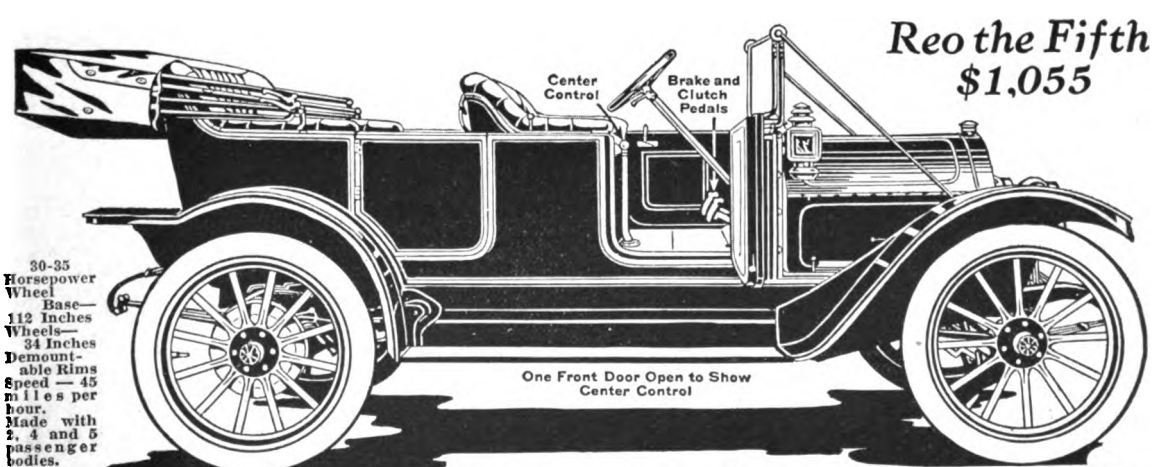
Reo the Fifth has my new center control. All the gear shifting is done by moving this lever less than three inches in each of four directions.

Both brakes are operated by foot pedals. There are no side levers, so the entrance in front is clear.

The driver may sit, as he should sit, on the left hand side.

The Little Price

The initial price of $1,055 is too low to continue, in my estimation. It is based on maximum output, on minimum cost for materials. I believe that it must be advanced.



While it continues, no car on the market begins to give for the money as much as does Reo the Fifth.

Ask for our books, giving all the details, picturing all the bodies. We have dealers in a thousand towns. Address

R. M. OWEN & CO. General Sales Agents for

REO MOTOR CAR CO., Lansing, Mich.

Canadian Factory, St. Catharines, Ontario.

30-35 Horsepower
Wheel Base—112 Inches
Wheels—34 Inches
Demountable Rims
Speed — 45 miles per hour.
Made with 2, 4 and 5 passenger bodies.

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip-cover, windshield, gas tank and speedometer—all for $100 extra. **Self-starter, if wanted, $20.00 extra**

5 x 37	57.00	60.20	10.60	—
5½ x 38	68.30	72.15	12.30	—

PERFORMANCE is the factor behind the success of Fisk Heavy Car Type Tires. Their rapidly increasing sale is due to the verdict of car owners who, once using them, buy again for their own cars and recommend them to their friends. "You are urged to inquire among many Fisk Tire users" because we can present no stronger argument than the everyday service Fisk Equipment is giving. MILEAGE and DIRECT REPRESENTATION combine to make the only service that really interests any buyer. It is THAT SERVICE upon which the success of Fisk Tires is founded.

The Fisk Tube is the *Pure Para Tube*

This accounts for the slightly higher prices, in comparison with other tubes, at which it is sold. The initial increased expense is slight—the resulting additional service makes it a far better buy than any one of the many *compounded* tubes sold at a lower figure. We had but one choice—to lower our present standard and *compound* our tubes or to hold to present construction and maintain slightly higher prices than other makers. We have decided in favor of *quality*, believing it far more economical in the end for every buyer.

Two New Anti-Skid Tires

THE NEW FISK TOWN CAR TREAD—Heavy Car Type—this tire provides a heavy anti-skid tread designed to insure traction and affords the greatest possible protection against skidding. It is positive in action on city pavements and country roads and eliminates the necessity of chains with the attendant expense, noise and inconvenience.

THE NEW FISK BAILEY TREAD—Heavy Car Type—Heavy buttons and one more row than any other Bailey Tread on the market. This increases the anti-skid surface and length of service, as outside rows of buttons give anti-skid protection when center tread is worn down.

Fisk Heavy Car Type Tires are Sold by all Prominent Dealers.

THE FISK RUBBER COMPANY

811-813 Boylston St., Boston.

THE INCOMPARABLE WHITE SIX

ELECTRICALLY STARTED AND LIGHTED--LEFT HAND DRIVE

THE WHITE SIX is equipped with a starting system that cranks the motor easily and naturally. There are no valves to leak, no gears to engage, and no explosions taking place in the cylinders while the pistons are stationary.

The White starting system is one hundred per cent efficient. Moreover, the lights are operated by the same system that starts the engine. Logical, isn't it?

The White Six makes it possible to reach the driving seat, start, and light the car without the necessity of stepping into the street.

Powerful and economical, with graceful and luxurious body and perfect road balance, owners have pronounced it the ideal Six.

NON-POPPET VALVE MOTOR DESIGN.

Constructional Features of Successful Types Produced in America—Outlining Theory of Valve Action and Method of Operation.

SINCE the successful demonstration of the Knight sliding sleeve motor, numerous other practical designs of the non-poppet valve, internal combustion engine have made their appearance in the market. This statement should not be taken as a suggestion that these later models are in any way patterned after the Knight, but it will no doubt be admitted by their designers that the success of this type has done much to encourage greater activity in the production of engines effecting somewhat similar results by different means. It may be added that inventors were at work upon this problem long before Charles Y. Knight produced his first practical device, and some of these motors are the result of experimentation covering a period of several years.

However, the attention of the motoring public has been drawn to this type of motor, largely because of the results obtained by the Knight engine. It has become generally known, and has served in a measure as a basis for comparison with other designs. There still remains a wide difference of opinion among engineers as to the relative importance of the non-poppet valve motor, and it may be stated that lay motorists have as yet had but very little opportunity to arrive at any definite conclusion as to the respective merits of the different constructions. This is due largely to the fact that such information as they have been able to obtain has been more or less fragmentary and

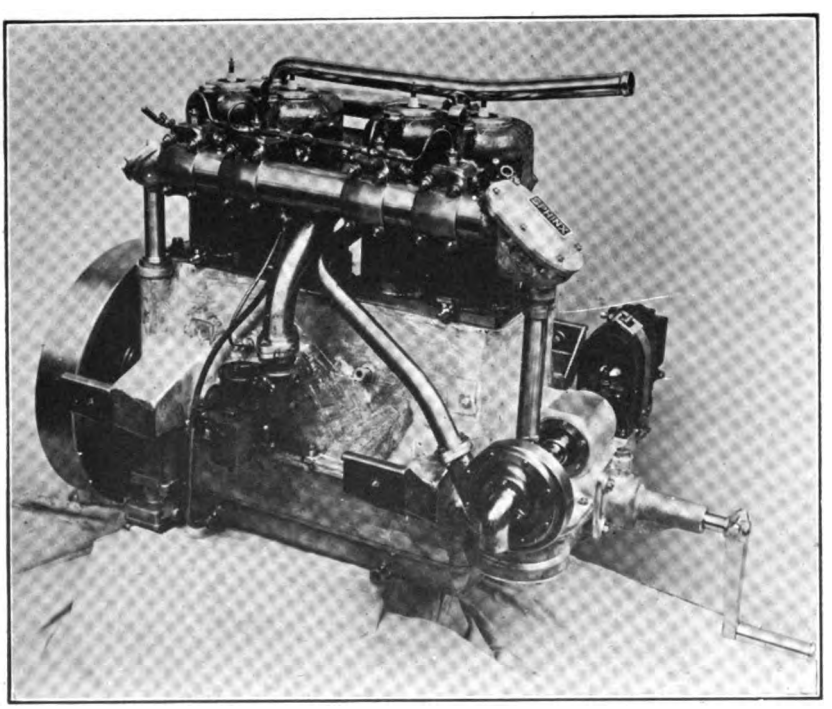

Fig. 1— Sphinx Slide Valve Motor Completely Assembled.

Digitized by Google

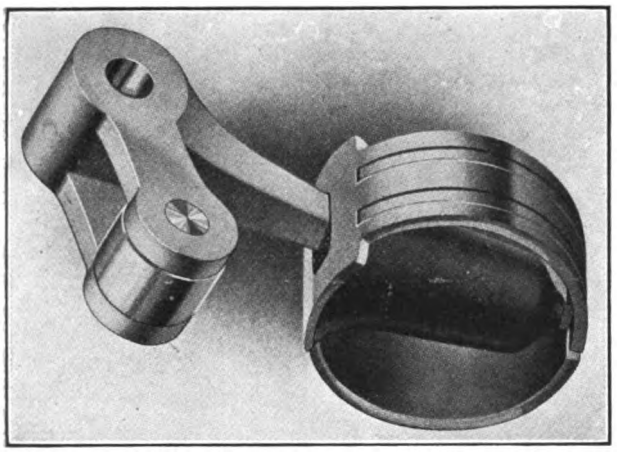

Fig. 2—Sphinx Split Ring, Presenting Construction of Hollow Spindle.

widely distributed as to time and source.

The object of this discussion is to present the claims of the various designers and manufacturers, devoid of all attempt to comment upon them, thus placing the average motorist in a position to decide for himself. It has been thought best to confine the descriptions to such motors as are produced or marketed in America, and the order of their presentation is not intended to convey any suggestion as to their relative merits.

Features of the Knight.

The Knight sleeve valve motor, utilized in this country in Columbia, Stoddard-Dayton, Atlas and Stearns cars, and announced for the new Edwards machine, has been very completely described in previous issues of The Automobile Journal, and as these cars have been displayed in all sections of the country, motorists are assumed to be familiar with its construction and method of operation. Briefly the valve functions are performed by two ported sleeves, one within the other, and both between the piston and the cylinder wall. The two sleeves are reciprocated by a half-speed shaft carrying small cranks equal in number to the sleeves.

Within the cylinder bore there is a thin sleeve, cut with ports on opposite sides to register with the inlet and exhaust. Within this sleeve is the other, also cut with ports near its upper end. The piston is located within the inner of the two sleeves. The cylinder head is detachable, and a part of it extends into the cylinder for some distance, but is of a diameter smaller than the cylinder bore, so that the two sleeves may enter between it and the cylinder wall. Both the cylinder head and the piston head are concave, the object being to secure a spherical combustion chamber, as nearly as possible.

As has been stated, the two sleeves are reciprocated by means of a half-speed shaft, which is driven from the crankshaft through a silent chain. The first named shaft is formed with a number of cranks, which connect through short connecting rods with lugs formed on the valve sleeves at their lower ends. The connecting rods for the two sets of sleeves are of different length, and usually are slightly inclined, a vertical line along which their upper end reciprocates passing somewhat closer to the cylinder axis than through the axis of the half-speed shaft.

It will be seen that the bore of the cylinder casting is not the effective bore of the engine, the latter being equal only to the bore of the inner sleeve. This usually is made of a thickness equal to about .04 inch for each inch of effective bore, and the outer sleeve is made a trifle thinner, because it is not subjected to the pressure of the explosion.

Office of Junk Ring.

Gas tightness is insured by two sets of packing rings, one set of three or four being placed on the piston in the usual manner, and the other on that portion of the cylinder head which projects into the cylinder proper and is surrounded by the sleeves. The latter set comprises one unusually broad ring at the bottom, referred to as a junk ring, and two or three of the same proportions as those employed on the piston. The junk ring does not possess sufficient spring force to apply itself properly against the sleeves, at least in most Knight motors, and spring rings are placed underneath it.

The object of the junk ring is to seal the ports

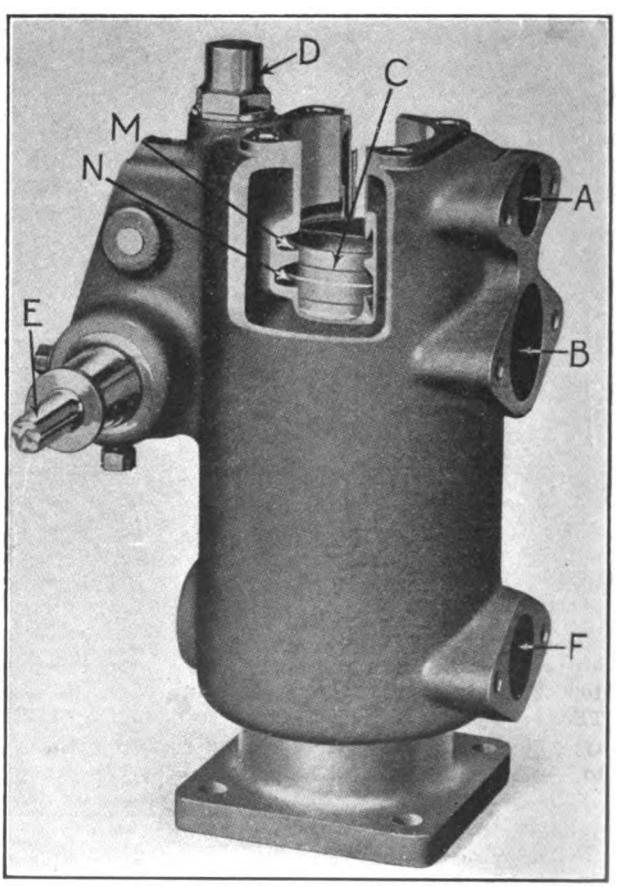

Fig. 3—Cut-Out Cylinder of Sphinx Motor, Showing Split Ring Position.

Digitized by Google

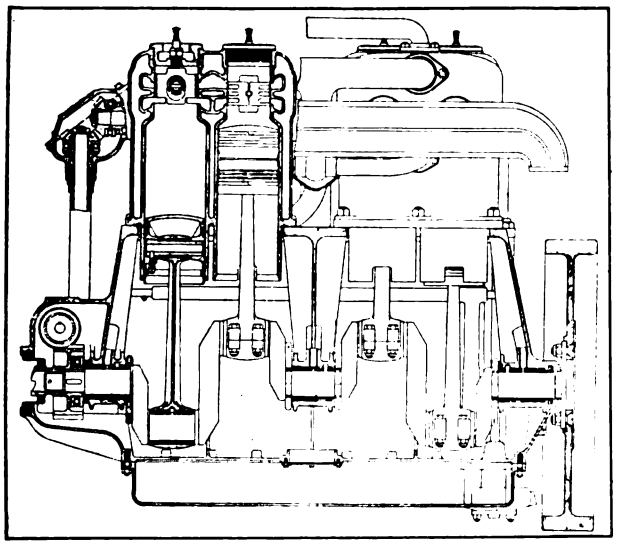

Fig. 4—Section through Sphinx Motor, Illustrating Piston and Split Ring Action.

in the valve sleeves when the explosion is taking place and while the gases are expanding in the cylinder. The ring, therefore, must be made of greater width than the height of the port, and usually is about half an inch wider than the exhaust member. Each port extends substantially around two-thirds of the cylinder, and it is provided with a bridge at the centre of its length, so as to prevent undue weakening of the sleeve.

On the suction stroke the inlet slots of the two sleeves come into juxtaposition one with the other so that the fresh mixture may enter as with the poppet or the mushroom type valve. When the compression stroke is begun these sleeves slide, one up and one down, so that the slots are out of register, and there is no way in which the gas can escape. After the compression stroke is finished, the piston having reached the top of the cylinder, the spark is timed to occur, and the explosion or power stroke takes place. Then, as the piston is at the bottom of its stroke, the opposite slots come into register, leaving an exit for the discharge of the burnt gases to escape.

Construction of the Sphinx.

The Sphinx slide valve motor, is produced in this country by the Sphinx Motor Company, 1770 Broadway, New York City, being made under license from the inventors of the Reno-Bois engine originally brought out in France, where it has been subjected to severe tests in the Unic F. N. and N. A. G. cars. The first bench tests of an American engine of this type were made recently, and the results were said to be entirely satisfactory in every respect.

In the cylinder walls and near the head are two annular chambers forming the intake and exhaust ports. Within the cylinder is a split ring having sufficient face depth to cover both of these ports, but having the necessary reciprocating motion to allow it to uncover either one or the other as required to assure the admission of the fuel and the discharge of the spent gases.

In its central position, the split ring covers the two ports, providing a gas tight chamber. One being moved down, it uncovers the intake port and the exhaust remains closed, and upon being raised it closes the intake and opens the exhaust. Being split, it is claimed that its extensibility assures that it shall be gas tight, the degree of tightness being in proportion to the pressure in the cylinder, while leakage around the ports is held to be impossible at any time. Its movement is slight, being less than one inch for a motor of 3.9-inch bore and 5.5-inch stroke, and the intake port being above the ring, this latter is swept by the fresh, cool gases at every induction stroke, and consequently maintained at a moderate temperature.

By examination of Figs. 3 and 5, which present a model of a single cylinder, it will be seen that the cylinder differs in construction from the usual poppet valve type, by having no outstanding chamber to receive the valves. Down on one side of the motor and near the head of the casting are the two ports, A being the intake and B the exhaust. On the op-

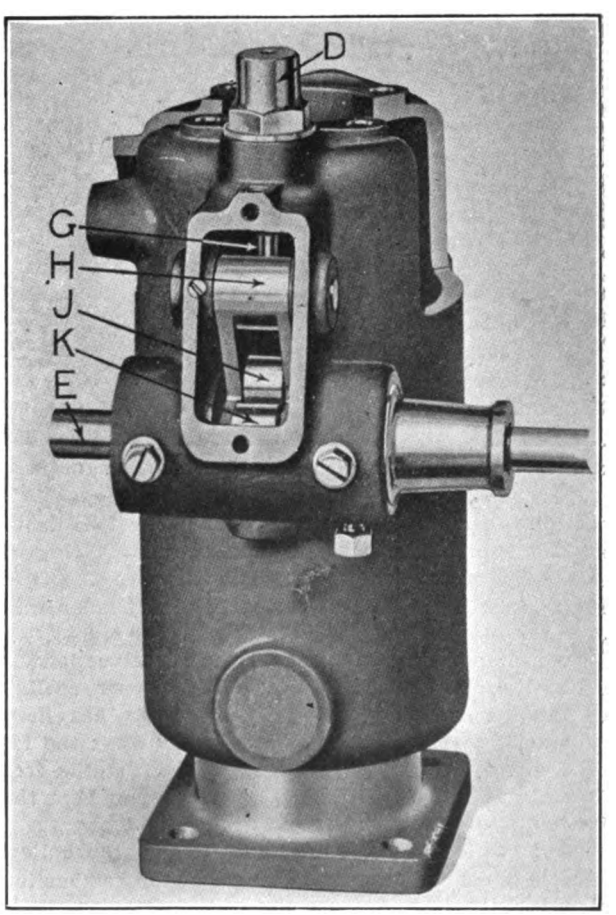

Fig. 5—Depicting Means for Operating Valve Mechanism in Sphinx Motor.

Digitized by Google

posite side is a camshaft housing, cast with the cylinder. In the cutaway section of the cylinder, M and N are the annular chambers cast in the cylinder wall and registering with the intake and exhaust ports, respectively. C is the split ring, which is shown separately in Fig. 2. In the position indicated in Fig. 3 it is uncovering the intake port. F is the inlet to the water jacket.

Action of the Split Ring.

The split ring is a gray iron casting having face depth of 1.5 inches for a motor of 3.9-inch bore and 5.5-inch stroke, and being provided with a hollow spindle or bearing block into which the rocker arm H, Fig. 5, is received. As will be seen from examination of the illustration, the depth of the ring is greater around the hollow spindle than at any other point, this increased depth being necessary to uncover the port, through which the rocker arm passes from the

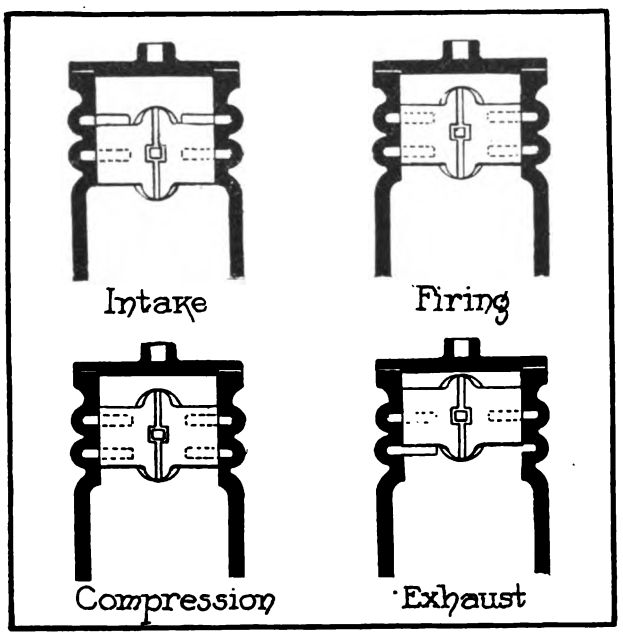

Fig. 6—Sketch Indicating Position of Sphinx Split Ring During Various Piston Strokes.

outside to the inside of the cylinder. The face depth at this point is sufficient to assure the covering of this port, no matter what the position of the split ring. In other words, this slot in the cylinder wall is never uncovered.

An important feature of the construction is claimed for the method of insuring proper cooling of the central portion of the ring. As has been explained, when the ring descends to uncover the intake, there is nothing whatever to obstruct the free flow of gas into the cylinder. It is obvious that the fresh mixture must be swept around and about the central portion of the ring, and although the hollow spindle is carried across the centre of the combustion chamber, its shape and the size of the space on either side are held to be such that there is nothing to prevent this free flow. Moreover, the cooling effect of the fresh charge being swept over the ring does much to maintain it at a moderate temperature.

When the ring is raised to uncover the exhaust port, this latter being below the ring, the hot gases escape without any obstruction and without being swept around the hollow spindle. The walls of the ring are in direct contact with the water jacketed walls of the cylinder, and work under practically the same conditions as do piston rings.

The method of operating the ring is by means of a bell crank H, the short arm of which carries a roller J, in constant contact with the face of the cam K. As the boss of the cam lifts the roller, the ring is raised. The return of the ring is obtained in practically the same way as with a poppet valve; namely, by means of coil springs carried in the housing D operated by the pin G. E is the camshaft.

The spring mentioned need only be sufficiently strong to compensate the weight of the split ring, for it is only responsible for its return and in no way for its proper seating. Further, as each upward movement of the ring is followed by the induction stroke of the motor, the work of the spring is relieved by the inrushing gases. In other words, the suction of the gas around the ring tends to draw it down, just as an automatic intake valve is drawn down on the suction stroke of the motor. The spring then, need only be sufficiently strong to keep the roller in contact with the face of the cam, and as it is carried in an independent housing and not subjected to a high temperature, its life is held to be practically indefinite.

Method of Lubrication.

All the main bearings receive their oil supply under pressure, with the crankshaft bored out to allow a supply of lubricant to reach the connecting rod ends. The oil thrown out from the bearings is claimed to be sufficient to assure the proper lubrication of the cylinder walls. The oil pump also delivers a supply of lubricant into the housing containing the bell cranks, a constant level being maintained at this point, and the overflow being returned to the oil tank in the base of the crankcase. The rotation of the camshaft throws the oil onto the bell crank and causes it to fill the hollow spindle of the split ring, thus allowing the inner bearing of the rocker arm to work in a bath of lubricant.

Sufficient oil escapes around the walls of the ring to assure its free movement within the cylinder, the constant expanding and contracting of the ring materially favoring the free distribution of the lubricant. There is said, however, to be no leakage during the compression and firing strokes, the high pressure in the cylinder at these periods maintaining the ring in close contact with the cylinder walls. It will be noted, also, that there is no movement of the ring during these strokes, and that its total movement is less than one inch.

Fig 6 sets forth the cycle of operation, this being brought about by means of the bell crank H, the rocker arm of which operates in the socket of the

Digitized by Google

sleeve valve, and an ordinary type of camshaft shown at E, Fig. 3 and 5, gives the necessary reciprocating movement to the ring. Fig. 4 presents a sectional view of the motor, and still further indicates the action of the valve, as well as that of the piston.

Mead Twin Rotary Valve.

The Mead Engine Company, Dayton, O., has evolved the Mead twin rotary valve motor, which has been in operation for two years or more, both in testing laboratories and in automobiles. A very successful demonstration was given in connection with the recent meeting of the Society of Automobile Engineers in Dayton, O., and the design may be said to have been proven thoroughly practical.

In this design two cylindrical gray iron castings are employed, one on either side of the motor cylinder head. At suitable points in these cylinders slots are provided for the admission and egress of the gases. One cylinder may be termed the intake valve and the other the exhaust. These fit the holes within which they are to rotate with a clearance of .0015 inch at the five bearing points, and about .0005 inch more clearance in the zone opposite the port openings.

In the end of the cast iron valve cylinder is screwed and pinned a steel stud or shaft, upon which is mounted the valve driving gear, as may be noted from the illustration at Fig. 9. A gear is driven into this taper, and a nut and lock washer hold it in place. A set screw through the hub of the gear bears against the taper shaft and assists in keeping the gear from rotating on this shaft. The speed of rotation of the valve cylinders is one-quarter that of the engine crankshaft.

Cycle of Operation.

Both valves are 1.375 inches diameter, and with slots 3.75 inches long. The slots for the inlet valve are .3125 inch wide and those for the exhaust .375 inch. It is claimed that any desired timing can be obtained. As the piston begins to descend on the suction stroke the intake valve begins to open and the exhaust is fully closed. The intake valve remains open until the piston has reached lower dead centre, or nearly so, when it closes, and both valve openings are closed throughout the compression and explosion strokes. As the piston begins to ascend on the exhaust stroke, the exhaust port is opened and the scavenging takes place. Thus is explained the cycle of operation.

It will be seen that the use of two valve cylinders simplifies the passage of the gases through the rotating valves. The inlet valve is always exposed to the same temperature of the incoming mixture. The water jacket which surrounds this cylinder is of uniform temperature, and extended experimentation is said to have demonstrated that there is apparently no tendency to warp or distort the cylinder in any way. This cylinder is lubricated by feeding a manifold to the inlet side of the motor, which has five openings to the inlet valve bearings. Only one lead from the force feed lubricator takes care of this valve. The oil distributes itself over the entire length of the valve.

Much the same is true of the exhaust valve. The escaping products of combustion are very hot, but as the cylinder is exposed to an even degree of heat, it is claimed there are no injurious inequalities. The valve is in close contact with the water jacket, rotates slowly and uniformly, and is thoroughly cooled. The method

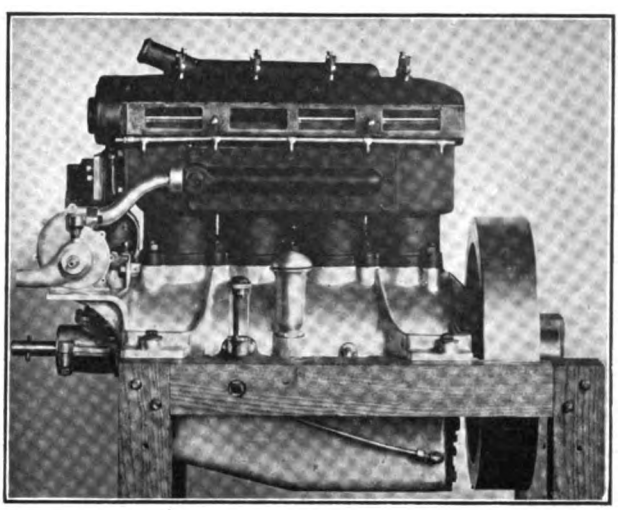

Fig. 7—Side View of Mead Engine, with Plate Removed to Expose Rotary Valve Cylinder.

of lubrication is the same as with the inlet valve.

Accompanying illustrations present the construction in more detail, and ought to assist materially in bringing out the features. Fig. 10 shows a section through the motor cylinder and valves and will aid in presenting the cycle of operation, explained above.

The Knight-Davidson Motor.

The Knight-Davidson motor, displayed publicly for the first time at the recent Boston automobile show, is the creation of Miss Margaret E. Knight of South Framingham, Mass., a woman of rare mechanical ability, who had the distinction of being the first woman to whom a United States patent was issued. The name is the combination of the names of the inventor and her niece, who has acquired a surprising

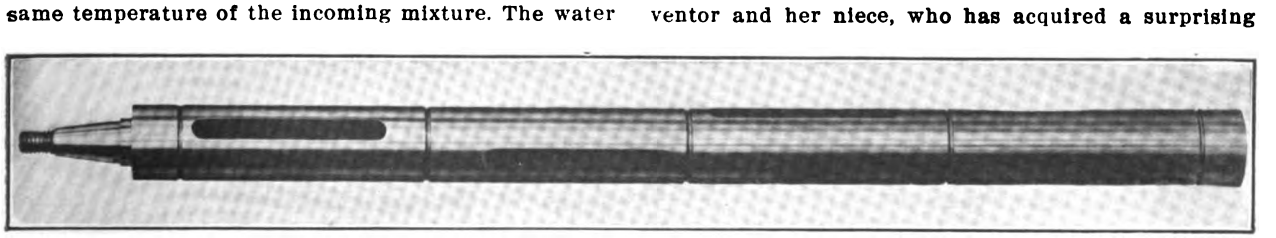

Fig. 8—One of the Rotary Valve Cylinders Employed as Intake and Exhaust Members in the Mead Motor.

Digitized by Google

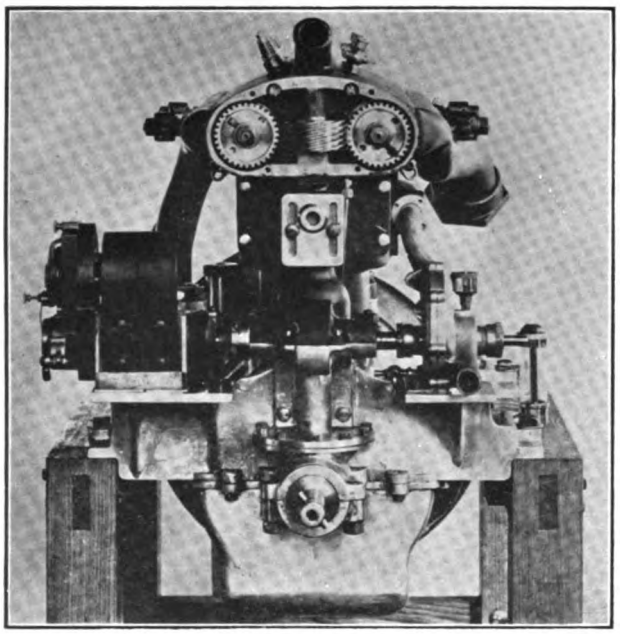

Fig. 9—End View of Mead Rotary Valve Motor, Showing Driving Means for Valve Cylinders.

knowledge of mechanics during her long association with her aunt.

Miss Knight has invented many machines that are in daily use, one of them being that which makes paper bags with the square bottom, the first practical mechanism that could produce a bag of this kind. Some of her inventions are in use in cotton mills, for Miss Knight when a girl and young woman, following a custom of New England families, worked in such factories and obtained improved results in her work through her mechanical ingenuity.

Later she turned her attention to the development of internal combustion engines and in 1896 produced her first slide valve or sleeve motor. She was at that time experimenting to learn the value of different fuels and while the original was crude she found results of sufficient value to justify her to continue its development. The work on the motor was not systematically followed for other things occupied Miss Knight's time. The original purpose was to use the motor for marine work and the first motor was quite heavy. With the progression of the work the engine has been lightened until that which was shown, though not the most perfected, was rated at 50 horsepower and weighed about 400 pounds. It is claimed that the power developed by this engine is more than the figure stated, as shown by brake test. This is more than double the rating of the S. A. E., which is 25.6 for a four-cylinder motor of four inches bore. The stroke is six inches, however, the stroke to bore ratio being 1.50 to one.

Details of Construction.

The motor differs mechanically with any other engine construction now built. The cylinder is a cast iron tube with the base fitted into a recess in the top face of the crankcase. The piston is exactly fitted to the cylinder. The head of the cylinder is separate and this forms the top of the assembly, it being recessed to receive the cylinder. The water jacket is a casing that resembles an I type motor cylinder in that it is bolted to the engine case and has water space the entire length of the expansion chamber. The water jacketed head is bolted to the water jacket, and when the assembly is complete the cylinder is cooled by water save for the centre of the head, which is of heavy section and carries the spark plug in the centre.

From this description it will be evident that there is a chamber between the cylinder tube and the inner wall of the water jacket, in which the valves are operated. The valves are halves of a split sleeve, with a scarfed joint, which are concentric with the cylinder tube. The cylinder tube has at opposite sides the inlet and exhaust ports, which register with ports in the sleeve valves and in the water jacket. The exhaust port is approximately 50 per cent. larger in area than the intake port, this making for more thorough cleansing of the cylinder of combustion products, and more quickly reducing the expansion pressure of the exhaust. These half sleeves are operated by rods attached to a minature crankshaft that is driven by gears from the crankshaft proper.

It will be noted that the intake and exhaust ports are high in the cylinder and the engine efficiency depends entirely upon the location of these ports and the relation or timing of the valves or sleeves. The exhaust port is opened 30 degrees before the bottom

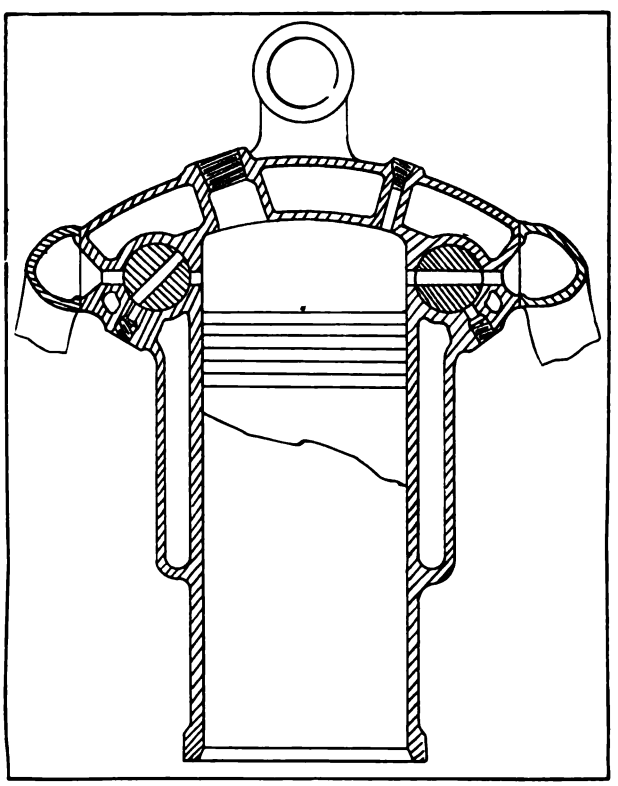

Fig. 10—Section through Mead Engine, Indicating Position of Valve Cylinders on Intake Stroke.

Digitized by Google

centre is reached and it is closed eight degrees after the top centre is reached by the piston. The intake port is opened eight degrees after the top centre is reached by the piston, and is closed 15 degrees after the bottom centre is reached.

In other words the halves of the moving sleeve are operated between the outside wall of the cylinder and the inner wall of the water jacket, and the rods actuating them move vertically, their relation being preserved by the linkage with the valve shaft.

How It Operates.

Reference to the accompanying sketch showing the motor in section illustrates the elements of the assembly and their functions. A and B are the two sliding half sleeves which move up and down about the cylinder and within the water jacket. The scarf joint is shown at C. The sleeve ports are indicated by O and G, and these register with the ports in the cylinder wall and the water jacket wall, the inlet being at I and the exhaust port at E. In the drawing E is about to register with the exhaust port opening in the cylinder wall port, the piston P being shown as moving upward and the cylinder exhausting. The sleeves are operated by the long cylindrical rods F and G, which are actuated by cranks on a longitudinal shaft that replaces the customary camshaft and is driven at half the speed of the crankshaft through gearing, as illustrated in the drawing. The cylinder wall or tube is indicated as D in the drawing and it will be noted that it is retained in the assembly by the clamping pressure of the cylinder head N when bolted to the water jacketed cylinder casing. This casing is designated as H H, and the water space is defined as W.

The piston is very carefully fitted to the cylinder. The relation of the sleeves and the cylinder is maintained by what is termed a "bridge ring" in which two wide rings are fitted into a long recess in the outer cylinder wall, these rings being kept at the top and bottom of recess and well apart by springs. The ring also compensates for all wear in the sleeves and insures against leakage. This construction is claimed to afford an unusual degree of compression, which is stated to be 33.3 per cent. higher than with the usual form of poppet valve engines. The normal compression pressure is given as 90 pounds.

The engine is claimed to be perfectly cooled at all speeds and under all conditions. The lubrication is by splash. The piston is fitted with an oil ring that distributes lubricant thoroughly on the inner surface of the cylinder. The pushrods that operate the sleeves are constructed with oil grooves which convey oil from the crankcase and adequately lubricate every moving part, irrespective of the engine speed. The engine cylinder is so constructed that should it at any time become worn it may be replaced by the removal of the head, as it is then unclamped and may be readily lifted out.

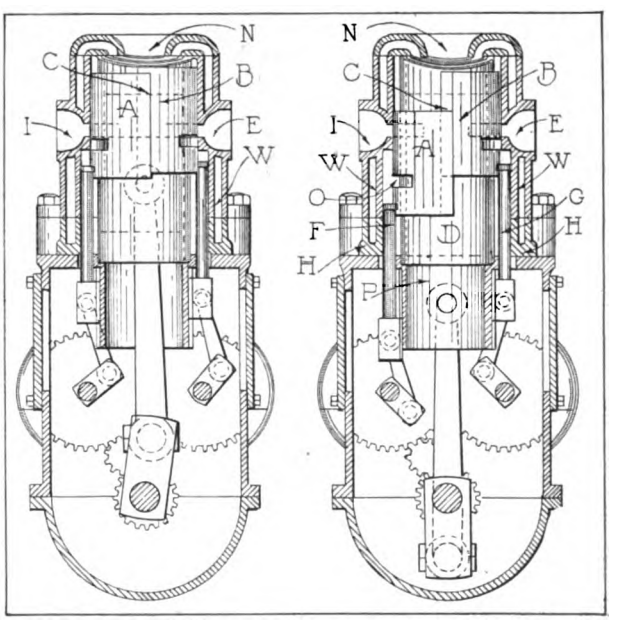
(To Be Continued.)

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

VANDERBILT AT MILWAUKEE.

While definite action has not been taken by the contest board of the American Automobile Association, it is taken for granted that the Milwaukee Automobile Dealers' Association, Milwaukee, Wis., will secure the Vanderbilt Cup race of 1912. Formal application has been filed with the Motor Cups Holding Association, and William K. Vanderbilt, Jr., donor of the cup, is said to have told the Milwaukee people they could have the race if they provided suitable police protection. Inasmuch as the dealers of that city have set out to win the honor, there is little doubt that the event will be held in that city.

Two courses are open for the race, one being the



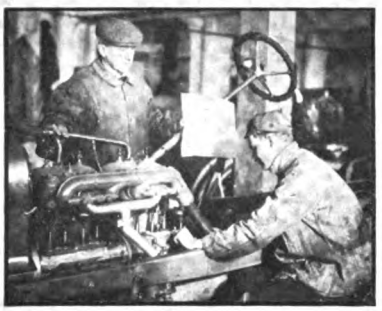


Fig. 11—Two Views of Knight-Davidson Sleeve Valve Motor, Illustrating Construction and Method of Operation.

so-called Milwaukee-Chicago course and the other being located in the Waukesha county lake district. Both are within easy access of all the important centres in the Middle West. The first course is the better known of the two, but the Waukesha has an added advantage in being in a district plentifully supplied with hotels.

It is understood that similar action has been taken with respect to the Grand Prize event as well, although motorists in Dallas, Tex., had made application for this race.

Changes in Dayton Club—W. L. Winning, formerly assistant secretary of the Chamber of Commerce in Dayton, O., and more recently secretary and general manager of the Dayton Auto Equipment Company of that city, has become secretary and general manager of the Dayton Automobile Club, succeeding Charles M. Stout, who became steward.

Overhauling the Power Plant of the Motor Car

C. P. Shattuck

OVERHAULING and placing the automobile in commission for the road may involve much labor and expense as well as considerable time, this depending upon the age of the machine, its condition and the service expected. It is assumed that the progressive motorist is ready to begin the overhaul, having stripped the car of its accessories and body, and prepared the necessary equipment including the new parts and material essential to place the machine in first class condition.

A large number of owners, however, whose garages are not heated, have been unable to accomplish much if any work of preparation because of the extreme cold weather. Many of this class have an elementary knowledge of the gasoline propelled vehicle and attempt their own repairs to effect economy, while others undertake the work to become more familiar with its components.

There is no reason why the overhaul cannot be accomplished successfully by those possessing a knowledge of the use of ordinary tools and of the components of the machine, if the work be performed systematically, taking the power plant, transmission, rear system, etc., in logical sequence. If the amateur in attempting his first overhaul studies each part and its relation to its neighbor as well as its function, and marks or tags the pieces for identification, he should be able to reassemble without having extra nuts or bolts at the finish, and it is for the benefit of those not familiar with the overhaul that the suggestions herein are made.

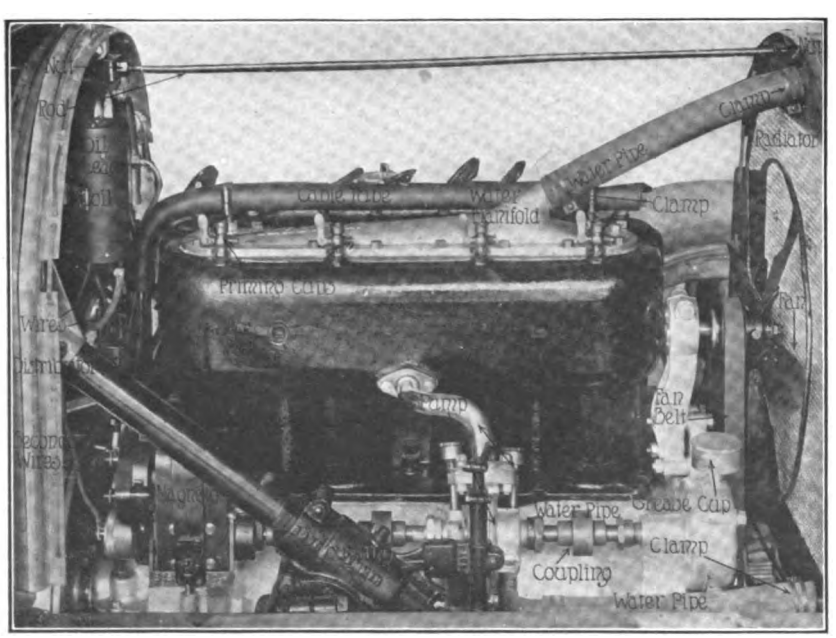

Fig. 1—A Conventional Power Plant with Hood Removed and Components Outlined to Facilitate the Dismantling of the Motor.

Care of the Hands.

Assume that the motor car is to be thoroughly overhauled; that is, stripped to the frame and each part examined for wear or needed replacements and adjustments. Having made ready the equipment for this work the overalls and jumper or old clothes should be donned and the car driven on the washstand where the first step is to remove the anti-freezing solution and to clean thoroughly the water circulating system. This is done easily by making a saturated solution of common washing soda and pouring it into the radiator, after which the motor should be started and run for some time. This will clean out all scale and deposits. The fluid should be drained out and replaced by fresh water and the motor again run. It is well to repeat the process until the water is clear.

The machine should then be run to a point convenient to the work bench and the hood removed. Before proceeding with the work of dismantling, the hands should be covered with hard soap and the material worked in under the finger nails if gloves are not to be worn. An old pair of gloves with the finger tips cut off may save bruises and cuts, although some workmen disregard these protectors. It is assumed that the accessories, top

Digitized by Google

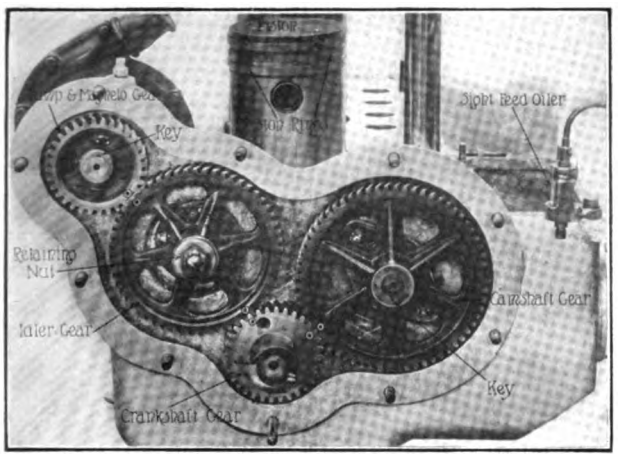

Fig. 2—Depicting How Timing Gears Should Be Marked Before Dismantling the Power Plant.

and body have been removed and covered carefully. The pan or undershield is usually held by straps, bolts and nuts and this member when removed should be carried outside for cleaning. The bolts and straps should be examined for wear and new ones secured if necessary.

Removing Radiator.

In dismantling the motor one should be systematic. At Fig. 1 is depicted a four-cylinder water-cooled motor with the exterior components clearly outlined. The gasoline should be drained from the fuel tank and placed in a can or cans for washing the parts. The fuel pipe at the carburetor is then disconnected. Some repairmen remove the superfluous dirt and grease before pulling down the engine while others postpone this work until it is on the motor stand.

The next step is to remove the radiator. The water connections should be disconnected and care taken not to spoil the clamps. If the starting crank extends through the cooler it is obvious that it must be disconnected before removing the latter. If the ratchet member be pinned the pin may be driven out with a punch and hammer, taking care not to injure the radiator. If the fan belt pulley be attached to the cooler, the belt will have to be disconnected and removed.

In removing the water pipes these members should be examined carefully and if not in first class condition new ones should be procured, retaining the old members for measurements. The radiator is usually supported by a rod connecting with the dash. The former is held by lock nuts and these should be loosened and the rod screwed out. After removing the nuts holding the cooler, this member should be lifted out. Some are very heavy and should be handled very carefully to prevent injury which might develop into a leak. If in need of repairs of a serious nature it should be sent to a competent tinsmith—one familiar with this type of work.

The water manifold on top of the motor is next removed, also the pipe leading from the pump to the cylinders. The retaining nuts and bolts should be loosened a trifle so that undue strain will not be exerted as some types of water manifolds are broken easily.

Disconnecting Wires.

The primary and secondary wires leading from the coil and magneto should be tagged before removal if the operator be not familiar with the ignition system. Where a dual system is employed a tag should be placed upon the wire and a corresponding identification mark on the terminal to which it is connected. Next, disconnect the spark and throttle leads and if in doubt tag the ignition members. Before loosening the bolts holding motor to frame, throw out and hold securely the clutch, or if the transmission be of the planetary type remove the flywheel bolts. The exhaust manifold and pipe should be disconnected and this may be a flange member or a union. If frozen, kerosene or heat may have to be applied to start the parts. All oil leads between motor and dash must be disconnected before taking out the motor.

Having made sure that the motor is clear and ready for removal, the stand should be moved in proximity to the chassis. It will require two or more persons to lift the engine out unless the garage be

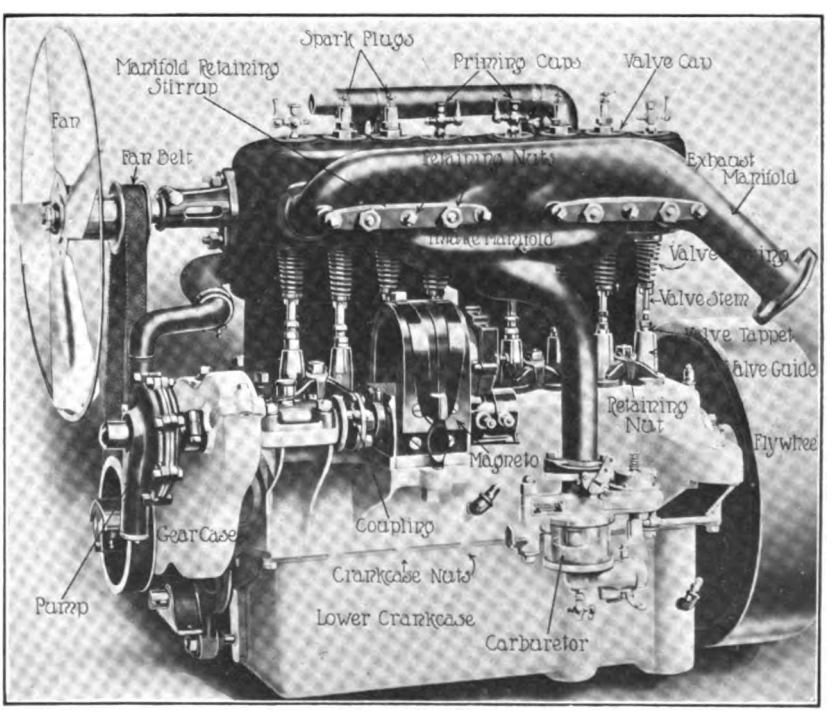

Fig. 3—Depicting the Valve Side of Engine and Outlining the Method of Retaining Intake and Exhaust Manifolds, also Pump, Magneto, Etc.

Digitized by Google

equipped with a falls and tackle or a differential hoisting appliance. If the motor and transmission be a unit four persons will be required to lift it out of the chassis.

Before proceeding to dismantle the motor, several boxes should be secured for the parts removed. At Fig. 3 is depicted a motor removed from the chassis and ready for disassembling and all parts to be removed are indicated. It will be noted that the exhaust and intake manifolds are secured by stirrups held by bolts and nuts. Each of the latter should be loosened a trifle to prevent stresses, as some intake manifolds are constructed of aluminum and easily damaged. The carburetor may be disconnected previous to the operation or left attached. These members should be put away where they will not be liable to injury.

If the oiler be not incorporated in the crankcase but located on the side of the motor, its leads to the various bearings, etc., should be disconnected as well as the device itself. If the water pump be located in front and driven by the camshaft, this member as well as the fan pulley will have to be removed in order to take off the gearcase cover. These parts may be keyed or pinned and if keys are utilized care should be exercised in removing the gears. The gearcase cover is then removed and the gears examined to note if marked. Fig. 2 outlines the method and if the members are not marked they should be, and this may be accomplished with a centre punch. The indentations will be necessary when reassembling the motor, as will be explained in logical sequence.

Marking Timing Gears.

Next, examine the couplings connecting the shafts driving the pump and magneto and note if these members are worn or the retaining parts loose. The magneto may be secured to its base by studs or a strap and if the current generator has been giving trouble it is best to ship it to the nearest service station and have it looked over. This may save considerable trouble as outside of a few minor adjustments the average motorist is not capable of overhauling these members.

The relief or priming cups are next removed and placed in a box, also the spark plugs. A special

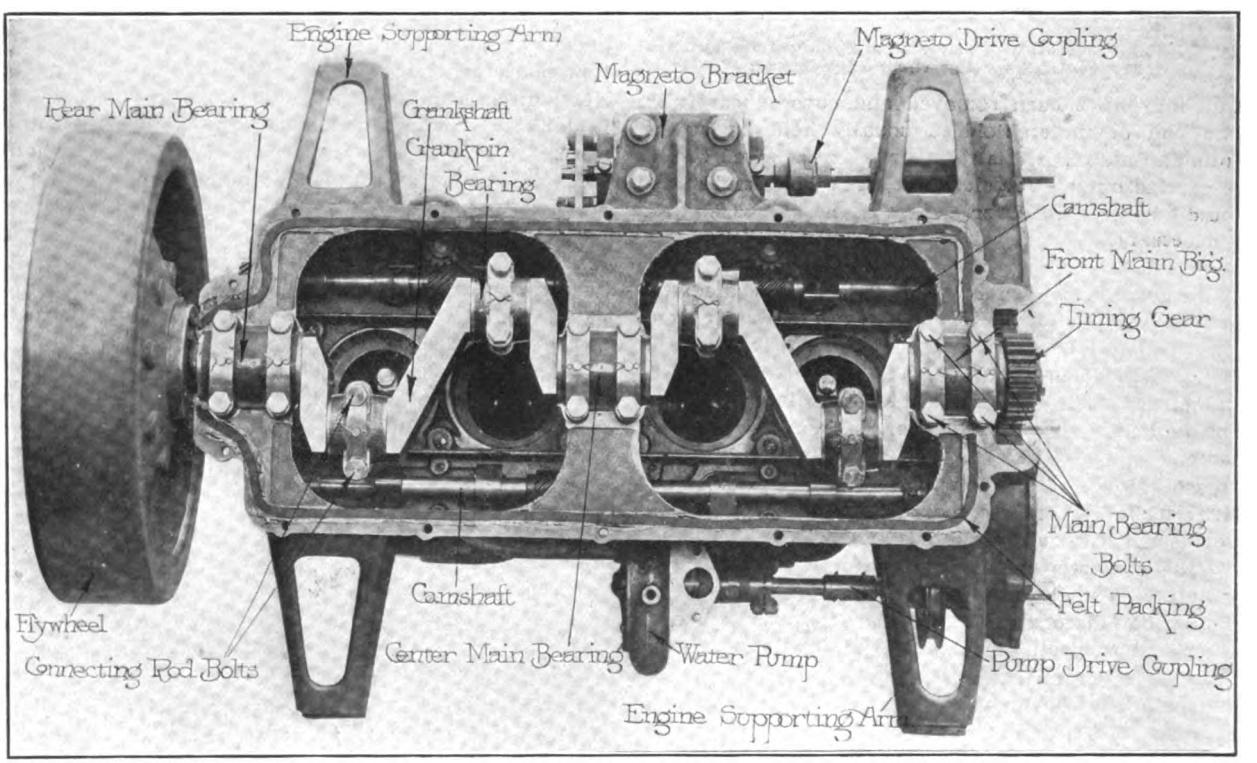

Fig. 4—How the Interior of Internal Combustion Motor of the Four-Cylinder Type Appears When Viewed from Bottom with Crankcase Removed.

wrench is usually provided for taking out the valve caps but when overhead valves of the rocket type are employed, ordinary tools will answer all purposes. The valve caps should be placed upon the work bench or a shelf in the order in which they were removed.

In displacing the valve springs a valve lifter will be useful although the operation may be performed with a block of wood and a heavy screw driver or old file, using the latter for the lever and the former for a fulcrum. A regular tool is best and one that holds down the valve will facilitate the work. The valve springs, retaining collar and pins should be taken out in order and laid upon a shelf on the bench. If a commutator or distributor is incorporated in the ignition system it should be taken off for inspection and

Digitized by Google

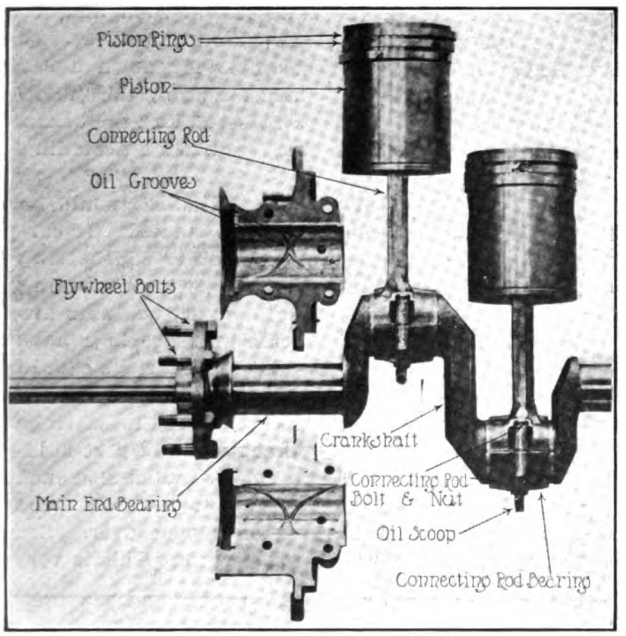

Fig. 5—Outlining Crankshaft, End Bearing, Connecting Rod and Piston, and Method of Assembly.

repairs if needed. Before removing this device the head of the shaft and the roller yoke should be marked in the same manner as the timing gears. This will save retiming the ignition.

Before removing the cylinders the old oil should be drained from the crankcase and the latter removed, exposing the connecting rods, crankshaft, etc. Fig. 4 outlines these members, each being marked for identification. Before taking out the connecting rod bolts it will be well to note if these be marked, and if not they should be so that in reassembling the bearings will not be reversed. If the rods be of the hinged type as shown at Fig. 7 C care should be taken to note on which side the hinge is located. This is important on some types of motors.

Removing Cylinders.

Having removed the connecting rod bolts the cylinders are now ready for removal. These are held by studs and nuts as outlined at Fig. 9. If cast en bloc there will be no need of marking, but should be if in pairs or singly. Take off the first cylinder with piston and connecting rod, observing that the latter is free from the crankshaft. Mark this cylinder with the centre punch with one dot, the next cylinder with two and so on. Place the cylinders on the bench and replace the connecting rod bearings in order; that is, just catch the nuts on the bolts.

The position of the motor is then reversed on the stand, which will permit of the inspection of the main and camshaft bearings. It may be that these members require but a slight adjustment. This may be determined easily by inserting a small bar of metal between the throw of the crankshaft and support and testing for looseness. Assuming that the bearings are loose: The retaining nuts of the main bearings are removed and it will be noted that these members are made up in two parts. If ball or roller bearings are fitted the novice had best not attempt to adjust them, as this work will require the services of an expert.

Scraping Bearings.

If the main bearing members are not numbered this may be accomplished with a centre punch. On a five bearing crankshaft these parts are marked on one side from one to five, and six to 10 on the other. This is done so that in reassembling the parts will not be reversed. The camshaft members should be similarly marked. The crankshaft is now removed, also the camshaft or shafts, and the crankcase bearing parts, crankshaft and camshafts thoroughly cleaned with gasoline. The bearings should be inspected for scores or uneven places and preparations made for removing these.

If the crankshaft, camshaft and crankpin bearings are worn oval the members should be sent to a machine shop equipped with a grinder. If but slightly scored a lapping tool may be constructed similar to a nut cracker, with the circular opening approximately the same size as the part to be smoothed. The size may be obtained by measuring with the calipers. Very fine emery paper or cloth, if properly used, will remove slight scores.

The cams should be examined carefully to note if the retaining pins are worn or the cams loose. In some types of motors camshaft bushings are employed and the camshaft driven in and cams fitted in the process. To remove a camshaft of this type will necessitate removing the retaining pins, which will be a difficult task for the amateur if not familiar with the work.

Before scraping in the bearings the valve guides and tappets should be examined for wear, also the

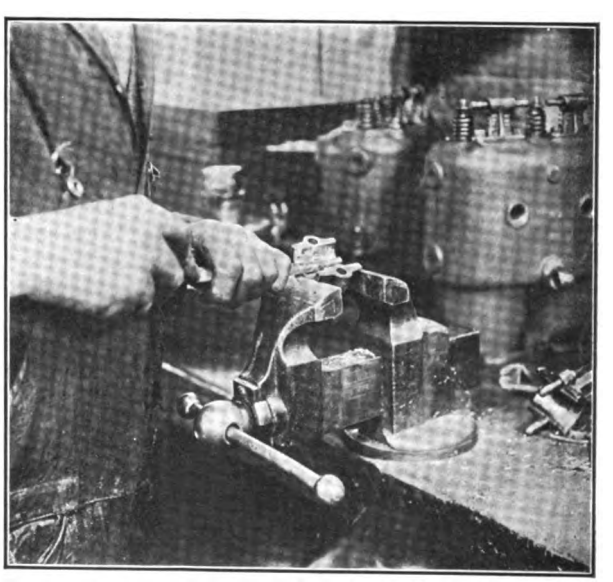

Fig. 6—Illustrating Proper Method of Holding Scraper While Working on Bearing Members.

Digitized by Google

roller member and pin. If the bushing is considerably worn, oil will leak out. Some are of the removable type and new bushings and tappets may be purchased or the old parts rebushed. If the pin retaining the roller be worn or if the roller be out of true, the timing will be affected and these parts should be replaced with new members. In taking these out they should be marked for identification.

To scrape in the camshaft bearings, the shaft is replaced in its seat and the bearings smeared with Prussian blue. The brasses are replaced and screwed down, the shaft rotated and the brasses removed. The high spots will be indicated by blue places; where the members do not bear there will be no color. The brasses are then placed in the vise and the bright spots removed with a scraper. The method and manner of holding tool is outlined at Fig. 6. A sharp tool is essential for this work. After the high spots are removed the process of reassembling, testing and scraping is continued until a good bearing is obtained. It is not necessary that the color show all over and uniformly. If three good strips show it will suffice. The scraping may appear tedious to the novice but it should be done carefully, removing the metal from all parts as uniformly as possible.

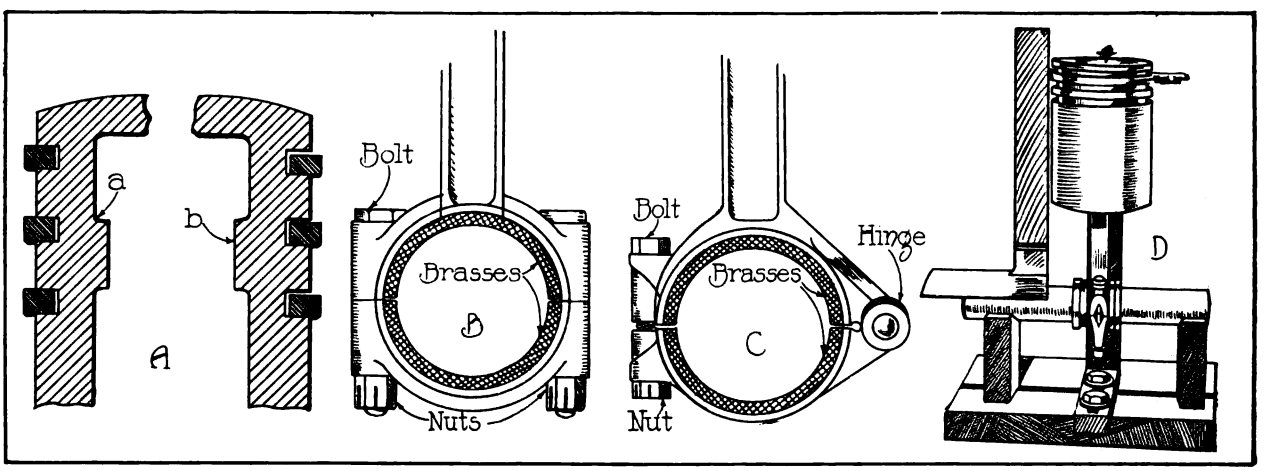

Fig. 7—Suggestions in the Overhaul: A, Proper and Incorrect Fitting of Piston Rings; B, Connecting Rod of Split Type; C, Hinged Member; D, Method of Aligning Piston.

Adjusting Bearings.

There are several methods of adjusting the bearings after scraping. If the two sections are removed from the crankcase, the members may be clamped to the crankshaft and tested on the work bench. The writer favors doing this work with the shaft in the crankcase, taking one end bearing and removing a shim or thinning it down, or if shims be not fitted, a board and emery cloth may be employed as indicated at Fig. 8 C. Care should be exercised not to remove too much of the surface. It is better to reduce a little at a time and try the part. If too much be taken off by mistake, a shim may be inserted. Sometimes a piece of tissue paper will suffice.

Bearings may be of different metals, and where babbitt is utilized this can be taken up snugly, for if properly lubricated at the start it will soon find its seat. Bronze and other metals should not be set up so tightly. It is rather difficult to lay down a set rule as the experienced workman knows by the "feel" when the bearing is right. In reassembling the crank and camshaft the gears should be meshed according to the marks as indicated at Fig. 3.

The nuts of the bearing being adjusted should be set up good and hard and the shaft rotated. If correct, the nuts are loosened and the other end bearing treated in a similar manner, as well as the remaining bearings. These are left loose; that is, the nuts are not screwed down until the camshaft bearings have been adjusted. Before assembling, all bearings should be liberally oiled and care should be taken to note if the oil holes and grooves are clear, else the bearings are liable to be burned out. Each nut and part holding bearings should be set up snugly and the wrench given a tap with a hammer. The nuts hould be fitted with new cotter pins and the ends bent over. See that every nut and bolt has a cotter pin. This is very important and is sometimes overlooked by experienced workmen.

Before scraping in the bearings the flywheel should be examined to note if it be snug upon the shaft; that is, if the key be not loose, which may account for that mysterious knock. Removing this key may appear to be difficult to the amateur but at Fig. 8 A is shown a method of doing this work. If the flywheel bolts are worn, the holes should be reamed out and new members fitted.

Overhauling Timer.

The gears driving the timer or distributor should be looked over for excessive wear or loose keys or pins, as well as the timing gears. When these members are loose or worn excessively the operation of the motor is affected thereby. Regarding the timer it may be loose and require a new bushing if not of the adjustable type. The fibre may be uneven, as well as the roller and pin. These should be taken to a machine shop and trued up and new pin fitted, unless

Digitized by Google

the operator be familiar with the lathe. The timer or distributor shaft should be tested to note if there be any play in the bearings, and if any exist new bushings should be fitted. This is a task for the machine shop unless the parts can be secured from the maker of the car.

In adjusting the connecting rod bearings this work may be performed when the crankshaft is out of the case and on the bench. The cylinders are arranged in order, and the connecting rod and piston attached to it are removed from the cylinder nearest the radiator end. The rod may be of the hinged or split type, these being depicted at B and C, Fig. 7. If the bearings have not been adjusted many times shims or washers will be found. If these are strips of thin metal the work of adjusting will be easy. If a solid piece of brass or fibre, they will have to be reduced as required by laying flat and rubbing on a file or emery cloth. The bearings may be scraped, as were the main and camshaft members, and fitted

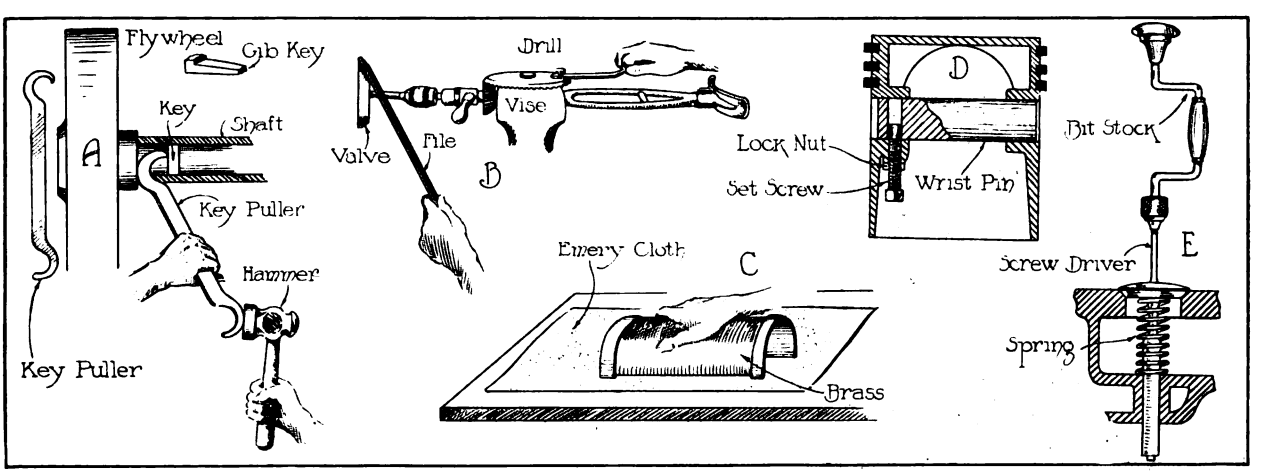

Fig. 8—Overhauling the Power Plant: A, How to Remove Key from Flywheel; B, Utilising Breast Drill and File to Reface Valve; C, Method of Reducing Bearing Member; D, Conventional Wristpin Retention; E, Illustrating the Use of Bit Stock in Grinding Valves.

properly, not neglecting the matter of lubricant.

If new bearings are fitted the piston should be tested for alignment; that is, the piston should be at the proper right angle to the crankshaft. At Fig. 7 D is presented a method of slipping the big end of the connecting rod on a mandrill or bar which itself rests upon a couple of V blocks, the latter having a base consisting of the usual surface plate. The piston is supported by a bar at the rear which keeps it upright. A square having a V shaped base, which fits on the mandrill, is held against the piston, behind which is placed a sheet of white paper. The white line between the edge of the set square and the piston enables the operator to note whether the width varies. If the piston prove to be out of line, it is better to set the connecting rod slightly in the vise than attempt to rectify the error in the bearing surfaces at either end.

Having scraped in and adjusted the connecting rod bearings at the large end, the piston, rings, wristpin, etc., should receive attention. The piston and rings should be washed with gasoline and examined. The rings should next be removed and this may be accomplished by utilizing thin strips of metal inserted between the members and the piston. Remove the top ring first and others in order, and take care not to mix the rings as they should be replaced in exactly the same order. The carbon is now removed from the piston head and seats of the rings.

The bearing of the small end of the connecting rod should be examined for wear and if not of the adjustable type and the wristpin be worn badly, new parts will be required. The wristpin is fastened by several methods, one of which is shown at Fig. 8 D. The set screw is turned completely out and the wristpin driven out. A block of wood should be used and care exercised, else the piston will be broken. In reassembling these members the locking device, be it either a spring or cotter pin, should be inserted. In adjusting the members they should be snug but not too tight, else the edges of the piston will knock against the walls of the cylinder. The bearings should be well supplied with oil when reassembling the components.

Fitting Piston Rings.

The piston rings may have lost their elasticity or fit improperly. This will be denoted by discolored spots caused by the escape of burning gas. If the piston be cracked and a new one necessary, new rings should be procured with it and these members stoned on an oil stone if not smooth. Old rings may be improved by placing a thin strip of metal in the recess of the piston. In fitting new rings too large a gap should not be left in the opening. If not familiar with this work it is best left to an experienced workman. The drawing at Fig. 7 A will be of assistance to the novice, the sketch at a denoting the proper fit while that at b indicates a faulty member. In replacing the rings, the recesses of the piston should be well oiled. The bottom ring should be slipped on

Digitized by Google

first and the others in order. Having assembled the piston, rings and connecting rod, these are placed upon the crankshaft, and having adjusted the bearings of the rod correctly it is an easy matter to set these up snugly, taking care to use plenty of oil on the crankpin and insert cotter pins in each retaining nut. It should be mentioned, however, that the crankcase should be reversed in its position upon the motor stand.

The cylinders are next in order, and the carbon should be removed. If scraped clean to the metal the explosion chamber may be coated with graphite, also the head of the pistons, as this material will prevent to a certain extent the accumulation of the carbon. The writer adopts this method and engines thus treated do not carbonize as easily when the surfaces of the members are left rough.

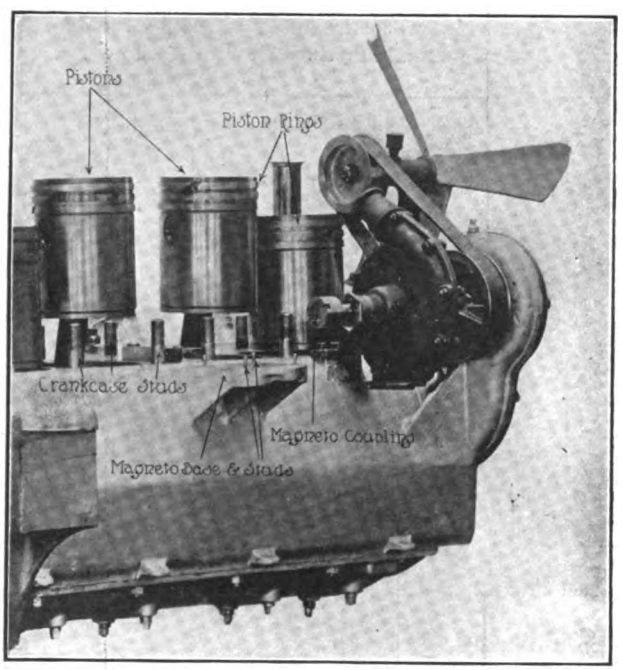

Fig. 9—Showing the Pistons in Position and Ready for the Replacing of Cylinders.

Before grinding in the valves they should be examined and if badly pitted or scored, and their seats as well, they should be refaced. If new members are required a valve seat cutting tool will be needed. At Fig. 8 B is outlined a method of refacing or truing up a valve by utilizing a breast drill in the vise and a flat file. There are several excellent valve grinding compounds on the market, but the writer favors the finest of carborundum mixed with plenty of oil. This will cut nicely and the operator should be careful in grinding.

Grinding Valves.

At Fig. 8 E is shown a method of grinding in a valve with a bit stock carrying a screw driver blade. The abrasive paste is spread upon the valve seat and the stem inserted in the cylinder with a spring fitted as shown in the drawing. The bit stock is turned first in one direction and then the other. Too much pressure must not be applied and from time to time it should be released, the paste washed off and renewed. The seat may be tested with Prussian blue as with the bearings. The valve and seat should be thoroughly cleansed with gasoline, and the valves and springs replaced. New springs may be needed or the old members stretched out.

Measuring Cylinders.

Previous to this work the cylinders should be examined for wear. If suspected of being out of true an inside micrometer or one with a vernier may be used. It is best to have a machinist attempt this work if necessary. If the cylinders are in bad shape, new ones may be procured or the old members bored out. This may require new pistons and rings as well, and upon this subject the novice will do well to consult some experienced repairman before planning the work.

If the cylinders are not found faulty, they are ready for replacement. The walls should be well covered with oil, also the piston and rings. At Fig. 9 is shown the power plant ready for the cylinders and in replacing these the novice is apt to break rings and damage fingers. With assistance and a ring clamp such as was described in a recent issue of The Automobile Journal, the work will be fairly easy. One person should steady the cylinder while the other compresses the rings.

Reassembling the Motor.

In reassembling the motor new gaskets may have to be purchased or made. These members are placed under the cylinders, used in assembling the water, exhaust and intake manifolds, and numerous other places. In dismantling, the type employed should be noted and the same material procured. Heavy wrapping paper may serve for the cylinders and lower crankcase, and when applied with a coating of shellac will make a tight joint. These gaskets may be made easily by placing the material over the cylinder or part and tapping the edges lightly with a hammer. Where the parts are exposed to heat, asbestos or mobiline should be employed or the copper asbestos ready made material.

In regard to gaskets the amateur will save time and trouble where the cylinders are cast singly, by making sure that these members line up; that is, the surfaces against which the intake and exhaust manifolds come in contact. In setting up, the nuts should be tightened gradually. In replacing the water manifold, rubber packing should be employed. This comes in sheets and may be procured at any mill supply house. In replacing the gearcase over the timing members, unless the case be machined and fit nicely, a thin gasket is recommended.

Before inserting the valve caps the threads should be smeared with a paste of graphite and oil, also the exhaust pipe union. The caps should be set up snugly to prevent leaks. The lift of the valves is next adjusted and by utilizing the marks upon the flywheel correct timing will be assured. When the tappets are

Digitized by Google

not adjustable the valve stems will have to be lengthened slightly and this may be accomplished by laying them on an anvil or surface plate and hammering the ends of the stems.

The packings in the stuffing boxes of the shaft driving the magneto and pump should receive attention, the material renewed if necessary and the parts adjusted. The fan pulley bearings should be inspected and the belt shortened or adjusted. The water connections and radiator should be replaced and the cooler filled with water to note if there be any leaks in the system. The other parts are next replaced, such as timer, magneto, wires and spark plugs, after which the lower crankcase is put on and filled with clean oil. The motor may now be rotated by hand and this may require considerable energy, but it will serve to splash the lubricant before starting up the engine.

If the remainder of the car does not require overhauling the fuel pipe may be connected to the carburetor, the spark and throttle rods attached, and the motor started. The oiler should be set to feed more than the usual and there should be plenty of lubricant in the crankcase. It may be necessary to prime the motor to aid in starting and it should not be run too long, but a few minutes at the time, which will aid in working in the bearings. The exhaust and intake connections, as well as the valve plugs, should be tested for leaks. This may be accomplished by squirting thin oil between the gaskets and noting if the oil bubbles. The same treatment may be applied to the valve caps. Those showing signs of leakage should be set up again. If a four unit or single coil employing a vibrator be utilized in the ignition system, the platinum points should be cleaned and readjusted.

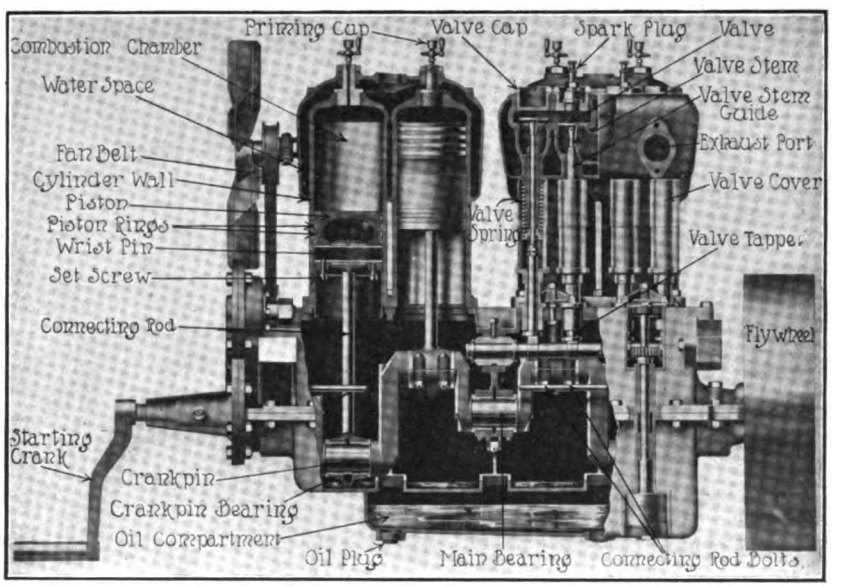

Fig. 10—Sectional View of Four-Cylinder Motor Showing Principal Components and Their Relation to Each Other When Assembled.

After the motor has been run a short time it is an excellent plan to go over it and try the nuts, as it will usually be found that some are not snug although set up tightly in the assembly. All grease cups should be removed in the overhaul, cleaned out and repacked with fresh lubricant. If the amateur proceeds slowly and when in doubt as to an adjustment will consult the experienced automobilist there is no reason why he should not successfully complete the overhaul of the power plant.

Indianapolis Orphans to Ride—The runs and tours committee of the Hoosier Motor Club, Indianapolis, Ind., has decided upon April 13, as the date for the first annual treat to the orphans of the city. The committee needs 50 cars to carry out its plans and anticipates it will have no difficulty in securing the co-operation of sufficient members of the club.

EDWARDS DISCUSSES FOREIGN FEATURES.

H. J. Edwards, who with O. G. Stoddard, both until recently connected with the Dayton Motor Car Company, a constituent of the United States Motor Company, has organized the Edwards Motor Company, for the production of a new Knight engined car, has returned from a trip to England where he studied the subject of designs. His discussion of this subject is interesting, in view of the bearing it may have upon the new Edwards car. He says:

"One thing which impressed me in my investigation of the wire wheel was the fact that the numerous accidents which we hear of on this side do not occur where wire wheels are used. I am fully convinced that nine-tenths of the cases where we have broken wheels would never have materialized had the spokes been of wire instead of wood.

"Very little if anything is being done in self-starters abroad. A few concerns are figuring on them but the fact that a very large percentage of the cars are driven by paid chauffeurs and that climatic temperatures do not reach the extremes we have here, has worked against any great amount of pressure being put upon manufacturers to furnish these devices.

"I am impressed very much with the progress and refinement in body design and construction across the water, as well as the tendency toward luxurious finish and the elimination of all vibration from the chassis."

Club in Davenport—A new automobile club has been organized in Davenport, Ia., with the following officers: President, Decker French; vice president, Lon Marks; secretary, Woodworth Clum; treasurer, Dr. J. T. Haller.

FACTORS IN FOREIGN TRADE.

The bureau of manufactures, Department of Commerce and Labor, Washington, D. C., has prepared and is about ready to distribute a valuable booklet dealing with trade in foreign countries. In its 56 pages will be found answers to questions asked by every manufacturer sending out trade literature or opening correspondence with these countries. It tells what language is best to use, in what currency and weights and measures prices should be quoted, what postage should be placed on catalogues and letters, etc. Those desiring copies of this booklet, which is entitled "Factors in Foreign Trade" should make application at once.

EUREKA HONEYCOMB RADIATOR.

One of the important components in connection with the water-cooled motor is the radiator, for upon this member depends to a certain extent the efficiency of the engine. If the cooler be improperly designed the motor will overheat and its operation become affected thereby. The member should be substantial and so constructed as to resist the vibration set up in traversing rough roads. The proper mounting also is essential.

Eureka Radiator, of Which Great Strength and Efficiency Is Emphasized.

The Eureka Parts Manufacturing Company, 3100 Olive Street, St. Louis, Mo., is the maker of the Eureka honeycomb radiator of which is claimed great efficiency and correct construction. It is made of the very best material, of high grade workmanship throughout, and is provided with liberal radiating surfaces which are free from fins or projections. The cooler is very strong and handsome, guaranteed, and built in any size and design.

HONOR LONDON MEMBER.

Members of the Society of Automobile Engineers who participated in the recent European tour have purchased by subscription a Waltham chronometer for presentation to Arthur Ludlow Clayden, a member of the society resident in London, England. It appears that the original idea of the foreign trip was suggested by Mr. Clayden, and that he was actively engaged in making the arrangements on the other side. The gift was decided upon as a fitting testimonial in recognition of his services in this connection.

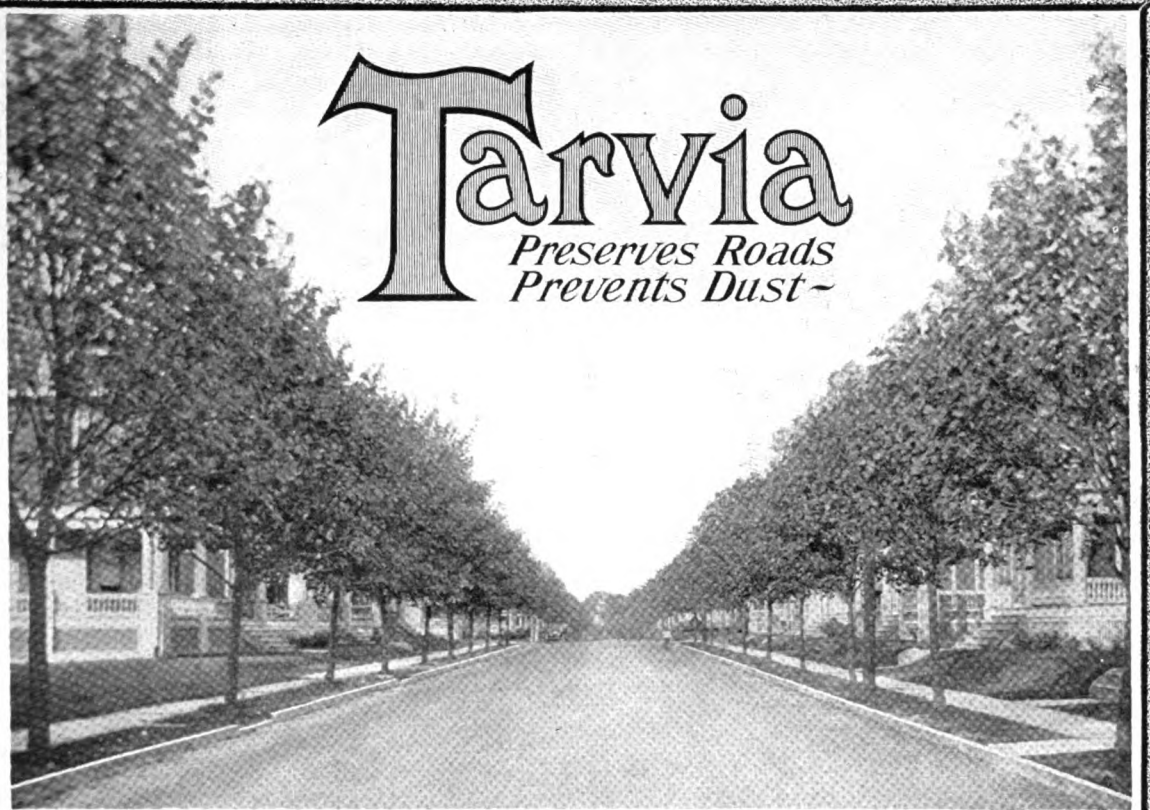
Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

COLE AND HENDERSON CARS.

Coincident with the announcement that Charles P. Henderson, president and general manager of the Henderson Motor Sales Company, Indianapolis, Ind., will become general sales manager of the Cole Motor Car Company of that city, July 1, comes the information that his brother, R. P. Henderson, is to become associated with the production of a new gasoline car to be known as the Henderson. Under the plan first mentioned, the present efficient selling organization of the Henderson company, which has acted as general sales agent for Cole cars, becomes a part of the Cole concern.

It is said that the change is due to the growth of the Cole Motor Car Company, which although but three years old is the largest individual manufacturer of motor cars in Indiana. The sales company was organized with stockholders and directors closely identified with the Cole company, and its entire efforts were devoted to the distribution of the Cole product, President J. J. Cole and his associates devoting their attention strictly to manufacture. Under the new regime no change in policy is to be made, the sales department retaining its downtown offices.

The new Henderson car is to be designed by Chester S. Ricker, until recently technical editor of Horseless Age. Among the stockholders of the new concern will be R. P. Henderson, C. P. Henderson, Chester S. Ricker, E. E. Rogers and L. Carter. Beyond the statement that the car will have a wheelbase of 116 inches, a self-starter and electric lighting equipment, no announcement has been made. Three chassis are now in process of construction in Indianapolis, where it is expected the plant will be located, and from a trial of these the final product will be determined.



GOODYEAR TIRES AT SHOWS.

Records have been made of the tire equipment at 64 automobile shows throughout the country, and it is announced that no less than 6597 cars were displayed. The tire equipment was divided between 29 makes, and of these Goodyear No-Rim-Cut tires made by the Goodyear Tire & Rubber Company, Akron, O., were the equipment on 2284 machines, or 34.6 per cent. of the total. Goodyear's nearest competitor showed 995.5 sets or 15 per cent., while the next make has 14.6 per cent. with 967 sets.

INCREASES CAPITAL STOCK.

At the annual meeting of the Pittsfield Spark Coil Company, Dalton, Mass., maker of the Pittsfield magneto, it was voted to increase the capital of the company from $100,000 to $250,000. This action was taken in order to increase the facilities for the production of the Pittsfield magneto. The following officers were elected: President, William P. Wood; treasurer, Louis B. Hopkins; directors, the above and Zenas Crane and Michael Casey.

Harrison Place, Irvington, N. J., Constructed with Tarvia X.

Latest Developments in Tarvia

TARVIA was the first bituminous preparation which appeared on the American market for preserving macadam roads and eliminating the dust nuisance.

The Tarvia, applied hot to the road, percolated into the macadam, sealed up the voids and locked the stone in a tough, plastic, automobile-proof matrix. The early work consisted merely of surface applications with "Tarvia A."

The development of the process has brought more and more thorough treatments until the best practice now calls for the use of Tarvia from top to bottom of the wearing course, applied during construction.

In some towns it has become a matter of fixed policy to build all new roads and pavements with "Tarvia X" as a binder.

Tarviated macadam is so much *more durable* than ordinary macadam, especially under automobile traffic, that the reduction in the cost of maintenance more than pays for the Tarvia. The use of Tarvia is thus justified merely on account of ultimate economy.

In addition, the tarviated surface is smoother and firmer. It is also dustless in dry weather and mudless in wet weather.

Tarvia is made in three grades:
"Tarvia X" for use in constructing roads.
"Tarvia A" for hot surface applications.
"Tarvia B" (applied cold) for dust prevention and road preservation.

Booklet describing the latest developments in methods for building tarviated roadways and pavements will be sent free on request. Address our nearest office.

RECENT DEVELOPMENTS IN SELF-STARTERS.

Continuing the Discussion of the Various Devices Now in the Market---Brief Description of Representative Types and Their Operating Methods.

CONSIDERABLE interest has been developed in the electric starter made by the Hartford Suspension Company, Jersey City, N. J. It has been known for months that E. V. Hartford was working on a device

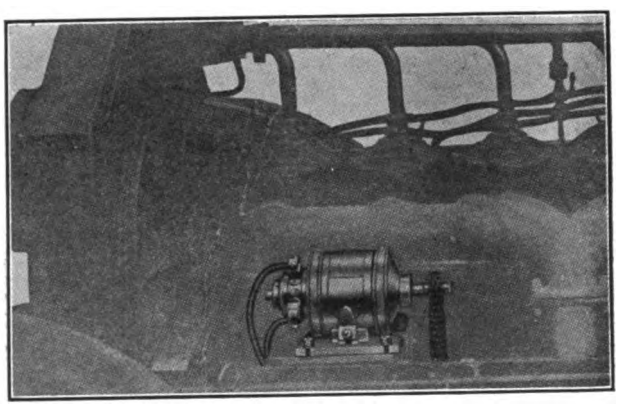

Fig. 1—Hartford Electric Starter Installed on Car, Indicating Its Small Size.

of this character, and it is now announced that he has been experimenting with his invention on a 90 horsepower, six-cylinder car for the past year and a half. As is the case with a number of the electric starters, it is designed to be operated in connection with the lighting system if desired.

The starting part of the system is shown at Fig. 1, and consists of a 12-volt motor, 4.5 inches diameter and 7.5 inches length. This is the size for medium powered cars, and that for machines of over 50 horsepower is about five by eight inches. This motor drives a combination worm and spur gear, the latter being keyed to the main shaft of the automobile between the engine flywheel and the gearbox, where a vacant space generally is to be found. This gear is fitted with a simple clutch and ball bearings. In mesh with the little motor is a worm gear, the reduction of which is 25 to one. The spur gear reduction is five to one, making a total gear reduction of 125 to one.

The motor also is fitted with a small balance wheel, weighing about 2.5 pounds and measuring four inches in diameter. The current is applied with a simple push button, and it is claimed that it uses approximately 180 watts. The speed of the motor is between 6000 and 8000 revolutions a minute, and the reduction is such that this turns the automobile engine over at the rate of 40 to 60 revolutions a minute.

As soon as the engine starts under its own power, the clutch on the main gear automatically and positively releases itself; the gears of the starting device, which are always in mesh, become stationary, and the main engine shaft simply runs on the ball bearings. The worm gear, instead of being keyed to the shaft, is simply slipped on the shaft and held in position by a little friction disc and a spider spring similar to the one used on the well known Truffault-Hartford shock absorber, made by this concern. Just enough tension is put there to drive the mechanism, and as a result, if a back-kick occur, it simply allows the shaft to slip around without injury.

Unlike some other electric systems, the little dynamo or generator is kept separate. The starting motor only being in operation a second or two when the engine is started. The generator, seen at Fig. 2, is placed at any convenient point where lighting generators are located at present, generally from the pump shaft of the engine, and is driven at about a two-to-one reduction. A combination magnetic cut-out and lighting switch is placed on the dash.

This disconnects the dynamo from the battery when the speed of the automobile becomes less than 10 miles an hour. There is an electrical checking system in the dynamo itself, which automatically controls the high speed without any mechanical slipping clutch or other device. This generator charges a 12-volt storage battery automatically, and the current for electric lighting, horn, starter and ignition is taken from this supply.

The Invincible Starter Company, Detroit, has only recently been incorporated for $25,000, and has elected the following officers: President, E. J. Corbett; vice president, D. W. Reinohl; secretary and general manager, H. J. Weeks; treasurer, G. S. Anderson;

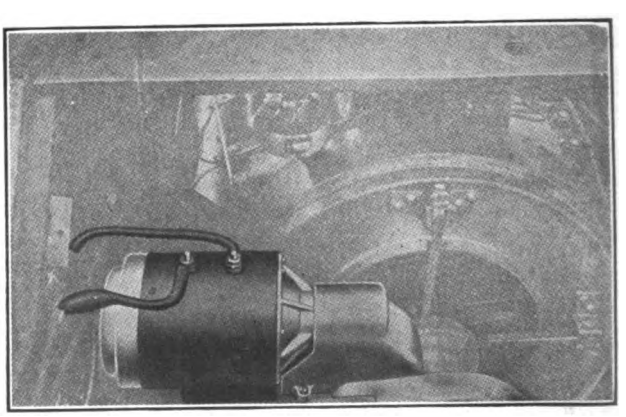

Fig. 2—Position and Appearance of Generator Employed with Hartford Electric Starter.

sales manager, Thomas Henderson; directors, E. J. Corbett, G. F. Monaghan, Walter E. Obtoby and D. W. Reinohl. This company manufactures the Invincible acetylene starter, in which the charge is drawn into

Digitized by Google

the motor through the intake manifold during its last few revolutions, and remains in the cylinders until it is desired to start the engine again. The device is illustrated in a comprehensible manner at Fig. 3.

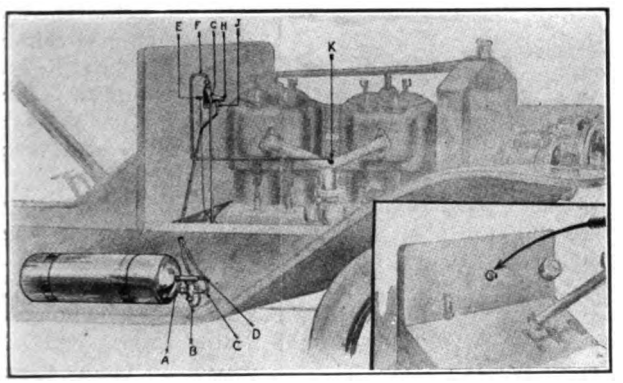

Fig 3—Illustrating Construction of Invincible Acetylene Gas Device.

The regular union is removed from the gas tank, and the two-way union B, supplied with the starter, is attached in its stead. The key way A is for the purpose of controlling the flow of gas to the lights, the acetylene being conveyed to these by means of the tube C. D indicates the lead to the mixing chamber E, on the front of the dash under the hood.

An adjustable air sleeve H permits of increasing or diminishing the flow of air, and is held in any desired position by a set screw. The mixture may be still further regulated by loosening a lock nut and adjusting a ball valve at G. J indicates the lead coming from the gas tank, and F the pipe carrying the mixture of acetylene and air to the intake manifold of the motor at K. The flow of gas through the starter is controlled by a Schrader tire valve. A plunger is fitted to the dash, within easy access of the driver's foot. This is shown in the insert at Fig. 3.

As the engine is about to be stopped, the operator retards the spark and throttle on the steering sector, switches the ignition control on the dash from the battery position to the magneto, and firmly presses the button on the plunger with the foot. This breaks the ground circuit, and allows the acetylene to flow to the mixing chamber, where it is mixed with air and passes through the drift tube to the intake manifold and thence to the combustion chambers. To start: Turn ignition control to battery, advance throttle and retard spark on the steering sector as is usual in starting car from spark. This is the device employed by the United States Motor Company on Maxwell cars.

The Henry Manufacturing Company, 141 West street, New York City, is producing the Blitzen acetylene device, which also charges the motor cylinders as the engine is about to come to rest. Those who have followed this series of articles are familiar with the fact that inventors disagree as to whether the cylinders should be charged during its last few revolutions, or when it is desired to start the motor. The Blitzen provides for both methods, in a measure.

Fig. 4 outlines in detail the construction of the device, and as the cut fully explains the various leads, there is little more to be said in the way of description. It may be stated that the two leads from the gas tank to the Blitzen valve and from this valve to the intake manifold, are of .1875-inch copper piping. The valve itself is small and exceedingly simple. The only other parts are the two-way valve for attachment to the gas tank, providing for a lead to the lighting system as well as the starter, and the starting switch on the dash, located within easy access, either of the hand or foot.

When the motor is about to come to a stop, the ignition switch is thrown to the magneto position. The switch on the Blitzen dash valve is then pulled against the binding post and held there until the engine is at rest. This action short circuits the magneto and at the same time opens the starter valve and allows acetylene gas to flow to the intake manifold.

In starting, the ignition switch is thrown to the battery position and the starter button is depressed. The motor should start at once, but if for any reason it is deemed advisable to give it more acetylene gas, the switch on the dash valve is operated in the same manner as when the motor was brought to a standstill, except that it is considered unnecessary to open the starter valve more than a little way in this instance.

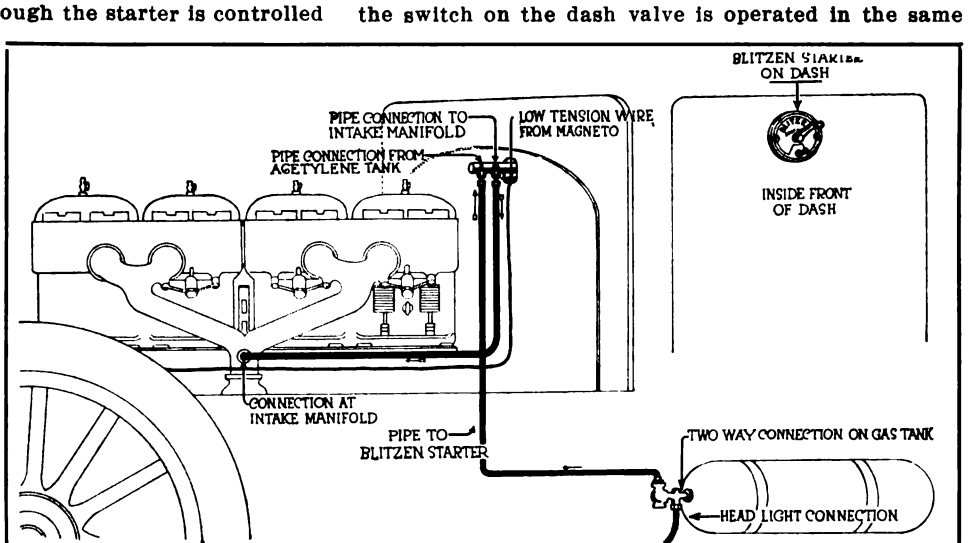

Fig. 4—Presenting the Features of the Blitzen Starter, Also Employing Acetylene Gas.

John W. Tudor, 35 Congress street, Boston, Mass.,

Digitized by Google

is producing the Tudor mechanical starter, upon which he began experimentation some three years ago. The device operates the motor by the uncoiling of a powerful spring. When thrown into clutch with the engine shaft, this spring gives three rapid revolutions of the motor. This action is accomplished by depressing a pedal in the floor of the car, and when this is released, the spring is again thrown into clutch with the engine, but in a reverse direction, and is immediately rewound for the next start, being automatically disengaged when fully rewound.

Referring to the blueprint drawings at Fig. 5, the various parts of the starter are explained as follows: The shaft A of the starter is linked to the engine shaft and rotates with it between bearings in the fixed frame of the starter. To this shaft A are secured two oppositely placed cup members of clutches 1a and 1b, to engage corresponding cone members of clutches 2a and 2b on gears 3, which are on the sliding portion of the starter. These cups are spaced to allow of sliding the geared part of the shaft between them. When midway between, so that neither clutch engages, the shaft A is free to revolve without motion to the starter proper.

This consists of a power spring 5 mounted on a vertical shaft and connectable by gears 3 and clutches 1 and 2 to the shaft A, for winding by sliding into one clutch 1a, or unwinding by sliding into the opposite ciutch 1b. The vertical starter shaft rotates in two sliding bearings 4 between which the power spring 5 is attached to the shaft at one end, and to a pin on the sliding frame 6 at the other. These two bearings 4 are yoked together by a U piece, which extends beyond the expanded spring. The lower end of the shaft carries a ratchet 7, which engages with pawls 8, pivoted to the sliding bearing 4 to hold the shaft when the spring is wound. The bearings 4 and vertical shaft and gears are slidable within the sliding frame 6, which carries locking pawls to prevent this motion.

Referring to the side elevation, the spring being unwound, and the engine running: A motion of the lever to the left throws in the left hand clutch 1a, rotates the gears and vertical shaft, and whirls the spring. Meanwhile the winding of the spring pulls on the shaft and its sliding bearings 4, overcomes the locking pawls 9 in the sliding frame 6, and automatically pulls the starter out of clutch with the engine.

The engine being stopped, starting is effected by throwing the lever to the right, this bringing the starter into clutch with the motor. The rod 10 on fixed frame comes into contact with the holding pawl 8, throwing it off and allowing the spring to unwind. A spring 11 is provided on the sliding frame, against which the releasing lever acts so that after starting the engine, the starter will fly back of itself and rewind the spring. Provision also is made for attaching a movable crank for cranking the engine independently of the starter, or for winding the spring, if desired.

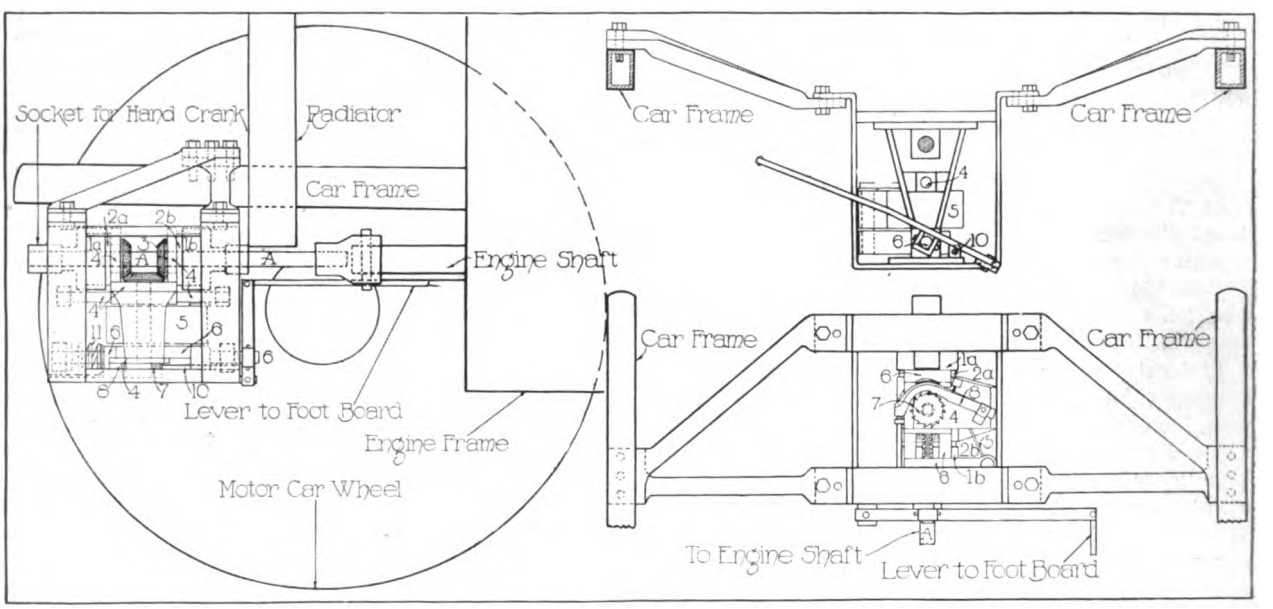

Fig. 5—Scale Drawing Indicating Construction and Operation of Tudor Mechanical Device: A, Side Elevation; B, End View; C, Plan.

NEW RECORD FOR DISBROW.

Driving a Jay Eye See special racing car, made by the J. I. Case Threshing Machine Company, Racine, Wis., Louis Disbrow made what is claimed to be a new world's speed record at San Diego, Cal., March 31. This mark is for one mile on a circular dirt track, which was covered in 0:38.62. The old record was held by Barney Oldfield at 0:51.8.

Universal lighting and uniform laws are the prime necessities for safe and sane motoring.

FEATURES OF REPUBLIC CARS FOR 1912.

IN PRODUCING but one standard chassis the Republic Motor Car Company, Hamilton, O., is continuing a business and manufacturing policy that was inaugurated when the concern was organized, and which has been dictated by a purpose to develop one vehicle to the highest degree consistent with the market price. The Republic cars have been produced with careful regard for sound engineering and well established principles rather than by experiment, and every detail of construction has been proven by unusually prolonged and severe tests. The number of machines built is limited and it is the claim of the maker that these are the highest type of medium priced vehicles.

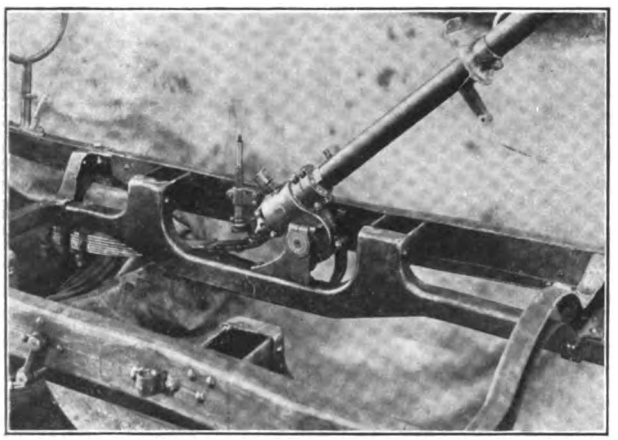
The chassis has a wheelbase of 120 inches and a tread of 56 inches. On this is installed as desired either a five or four-passenger touring body, or a roadster body. The touring bodies are fitted with that may be folded and stowed in a drawer-like compartment under the left side of the seat, this when rigged affording accommodation for a third passenger, who rides with his feet on the left running board. All the seats are low and deep. The five-passenger body is finished with Richelieu blue with black molding and gray stripe, or Republic gray with gray stripe, with gray wheels. The other bodies are finished with Republic gray with gray striping. The lamps and hardware are finished with black nickel or black enamel. The upholstery is black save in the roadster, which is gray.

The engine is a water-cooled, four-cylinder, four-cycle type with a bore of 4.25 inches and a stroke of five inches, having an S. A. E. rating of 28.9 and being rated by the maker at 35 horsepower. The cylinders are of the T head form and cast in pairs from

The Standard Republic Five-Passenger Touring Car for 1912.

fore doors of unusual width. The tonneau is spacious and there is abundant leg room for the occupants of the front seats. The forward compartments are ventilated by Republic patent ventilators placed in the skirt of the windshields, which may be regulated from the seat of the driver. The bodies are straight line with deep cowl dash, and the seats are so far back that the driver's seat is practically in the centre of the car. The running boards are short and the fenders are long and graceful, adding decidedly to the appearance of the vehicles. The four-passenger car has more room than the average machine of its class.

The roadster body has a long scuttle dash and the seat is well back, the doors being about the centre, while behind the seat is a high turtle back in which is abundant storage space. The doors are hinged at the front and can be opened by the driver without moving in the seat. There is a so-called trundle seat



fine gray iron with the water jackets integral. The casts are made with a large opening at the top of the cylinder units which permits the removal of the core and the thorough cleaning of the large water jackets. The cylinders are bored, then aged and reamed and ground to exact size. The pistons are of soft gray iron and these are turned and ground to a precise fit. Each is fitted with three rings that are ground on the edges and the face to insure complete retention of compression.

The engine case is an aluminum casting in two sections, the upper carrying the main bearings for the crankshaft, the camshafts and their bearings, the timing gears and their cover. The lower forms the oil pan and includes the reservoir for the lubricant and the oil pump. The case is strengthened by bridgework and the web that carries the centre main bearing.

The crankshaft is a drop forging of special alloy

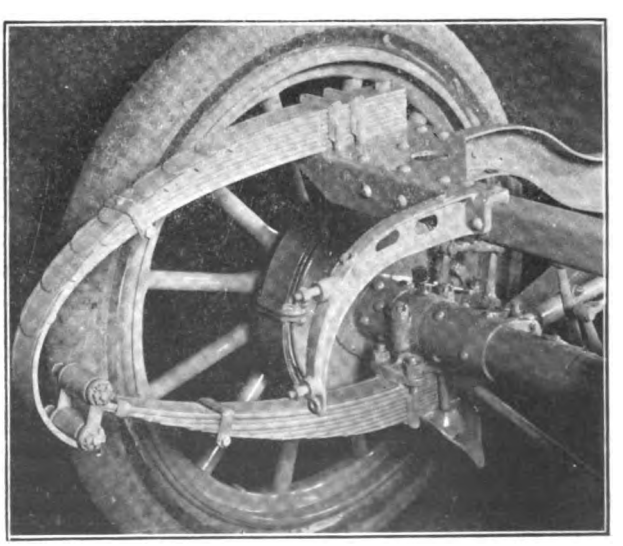
Digitized by Google

steel and is heat treated. It is carefully ground to size and finished. It is carried on three large bearings of a fine grade of bearing metal, these having

Sub-Frame for Support of the Motor and the Substantial Installation of the Steering Gear and Column.

unusual length. The connecting rods are steel I section drop forgings and have large big and small end bearings, these also being lined with the same quality of bearing metal. The pistons are offset .75 inch from the crankshaft centre line. The camshafts are a high grade steel, hardened and ground to size, and these have bearings of liberal proportions.

The inlet valves are at the right side of the motor and the exhaust valves at the left. The valves are of a high quality of steel operating in long guides. The pushrods are of steel, hardened and ground and are carefully fitted to the guides. The pushrods are equipped with means for accurate adjustment to compensate for wear and the valve action is practically noiseless.



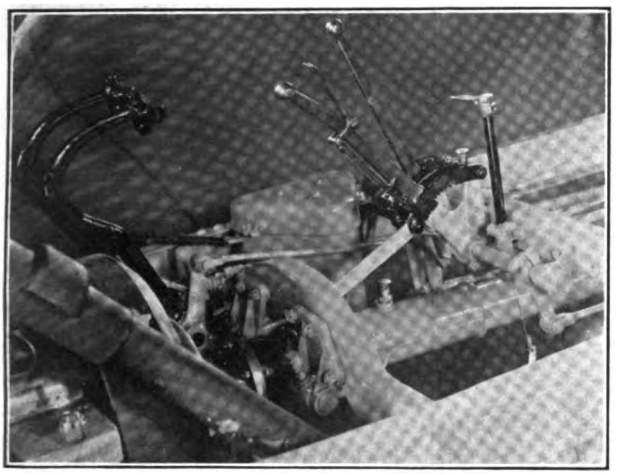
The large openings at the centre of the cylinder units are closed with plates that carry the water outlet manifold, these plates being retained by studs, the unions being made tight by gaskets. The manifold is large to insure a positive circulation of the water, which is driven by a centrifugal pump actuated by an outside camshaft. The water is passed through a large cellular radiator and enters the cylinders at the base of the exhaust valves, this insuring the positive reduction of the temperature of heated walls. The water capacity is large and the fluid is rapidly circulated, maintaining an efficient radiation at all times. The system is supplemented by a fan carried on a bracket ahead of the forward cylinder and which is driven by a flat belt from a pulley mounted on the water pump shaft. The fan shaft is adjustable to insure a proper tension of the driving belt.

The lubrication is by a combination of force feed and spray. The oil accumulates in a reservoir in the base of the crankcase and is drawn through a fine filter to a well at the base of a gear driven pump and forced through a system of tubes and a sight feed carried on the dash to each main engine bearing. The main bearings are grooved to retain the lubricant. In the crankshaft at each bearing is drilled a hole that registers with the tube outlet at each revolution and the crank throws are drilled from the shaft to the crankpins, with outlets to the crankpin bearings, so that the oil is forced through the channels in the shaft to each bearing, constantly flooding them when the engine is in motion. The spray thrown from the revolving shaft is sufficient to lubricate the camshafts, their bearings, the timing gears and the wristpins, cylinders and piston walls. The drainage of the oil after use is to the reservoir, where it is filtered and again circulated.

The ignition is by two distinct and separate systems, using two sets of spark plugs, one being carried at the side of the valve pockets and the other in the caps directly above the valves. In the caps above the exhaust valves are the compression relief and priming cocks. The initial system is with a Bosch magneto, using the spark plugs in the sides of the valve pockets, and the other is the Delco high-tension distributor battery system, with a battery of six dry cells as a source of current. The latter may be used as a reserve and for starting, and the magneto for regular service.

The fuel is stored in a tank having 18 gallons capacity, of which there is an emergency supply that may be reached easily by the driver. The feed is by gravity to a carburetor of the automatic float feed type. The intake is fitted with a special hot air attachment so that the conditions are uniform, and the lower section of the intake manifold is water jacketed.

The clutch is of the cone design, the cone being



Rear Spring Suspension of Republic Chassis, Showing Attachment to Gusset Plate Extension and the Underslung Rear Axle.

faced with leather and having cork inserts, which insure against slipping and afford a positive ease of engagement that eliminates all possibility of the an-

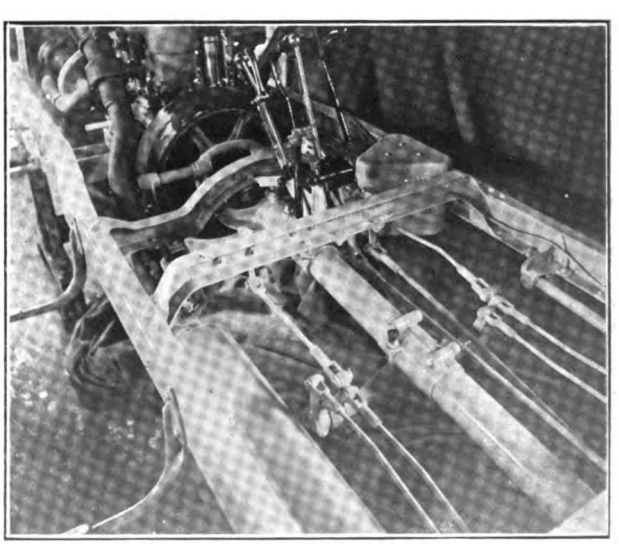
Digitized by Google

noyance of harsh clutching. The power plant and clutch are mounted in a sub-frame that is of unique design. The sub-frame is supported in the chassis

The Centre Control Levers, the Muffler Cut-Out Control, and the Steel Battery Box of Republic Cars.

frame by gusset plates that make for an extremely rigid construction. The engine is raised so as to have abundant road clearance with the chassis frame as low as is desirable to secure a satisfactory centre of gravity. The steering gear is attached to the sub-frame without obstructing the use of the engine auxiliaries.

Directly back of the clutch is the universal joint that couples the clutch shaft to the main driving shaft. The joint is with fixed centre and it is supported by the centre cross member of the chassis frame. Attached to the universal joint is the yoke at the forward end of the torsion tube that protects the driving shaft. The body may change its relation with the axles but there is no strain brought upon the driving shaft. The torsion tube is large and within it the shaft is mounted on a large roller bearing. This torsion tube extends to the transmission case, which is bolted to the front of the rear axle housing. The tube is very heavy and its position is maintained by two large distance rods extending from the rear axle to the sides of the chassis, just within the frame. There is no strain upon the torsion tube or the driving shaft.



The transmission is a selective type with three forward speeds and reverse with heavy shafts mounted on imported annular ball bearings. The gears are with wide faces and are of chrome vanadium steel. The transmission is driven in a bath of oil. The rear axle is a full floating design with a heavy steel housing. The differential assembly is mounted on imported annular ball bearings and the driving shafts are of vanadium steel. The differential may be reached for examination or work by the removal of a large cover plate.

The chassis frame is a pressed steel channel section with gusset plates integral. It is cambered at the rear to permit the use of the three-quarter elliptic springs and is constricted forward to afford a wider wheel lock, it being possible to turn the vehicle in a radius of 38 feet. The springs are chrome vanadium steel, those forward being semi-elliptic, 42 inches length and two inches width, the rear three-quarter elliptic, 45 inches length and two inches width. The manner of attaching the rear springs is original with this chassis and it is claimed to afford the greatest resiliency and eliminate the danger of breakage. The upper half-spring is anchored to an extension of the gusset plate to secure an offset and held by two clips and a half-inch bolt. The lower half of the spring is slung under the axle on an inverted spring saddle, permitting the full spring clearance with a very low slung body.

The front axle is a steel drop forged I section. The wheel spindles are mounted with large ball bearings, and the wheels are driven on large heavy duty ball bearings. The tierod is carried behind the axle and the draglink is above it, there being protection from road obstructions.

The brakes are both internal expanding within drums on the rear wheels. All the brake rods and their connections are within the chassis frame and are mounted on the torsion tube. The yoke supporting them is placed at the same relative point as are the ends of the radius rods and the movement of the rods and brakes is always the same.

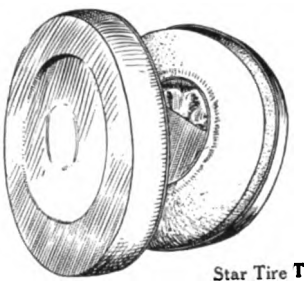
The control is by an 18-inch hand wheel at the right side with a two-inch column at an angle of 40 degrees for touring cars and 42 degrees for the roadster. The steering gear is mounted with a bearing on the chassis frame and the sub-frame, this giving an unusually strong support. The clutch and the

Suspension of Brake Rods on Torsion Tube of Republic Chassis.

service brake are operated by pedals with hand levers that are mounted in the centre of the chassis for the speed changes and the emergency brake.

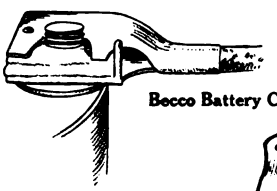
Digitized by Google

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.



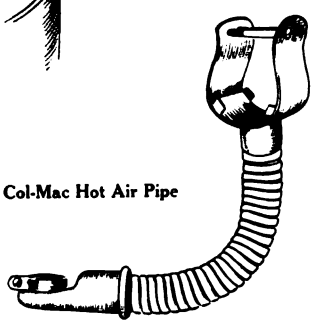
Star Tire Trunks will appeal to motorists of discriminating tastes as they are constructed in the form of a shoe and are very neat in appearance. They are made of pressed steel with a polished finish, and are light, strong, durable, clean and noiseless. A compartment is provided for the storing of inner tubes, and the trunks are thief and water proof. A feature is their accessibility. They are marketed by W. W. Winship, Boston.

★

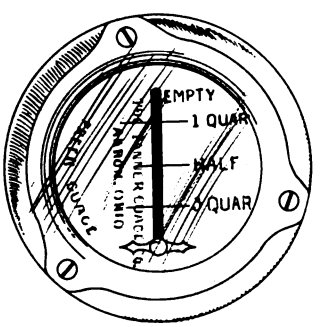


The Becco Battery Connector, manufactured by the Beck Company, Rockville Centre, N. Y., is an improvement over the ordinary form inasmuch as the construction of the device is such that it is claimed it cannot jar loose when properly attached. It is made in the form of a clip, two members being pivotally mounted and provided with a recess to fit the terminal of a battery. When placed over a binding post and the clips snapped together, it is stated that the use of a screw driver or similar tool is necessary to release the members. The device is made of heavy drawn brass, and is neat and inexpensive.

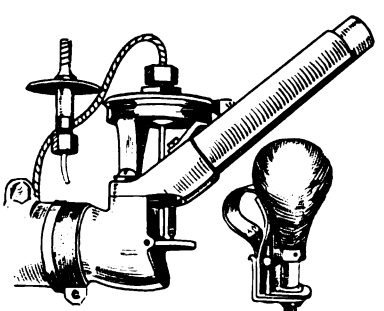
★



The Col-Mac Hot Air Pipe is a device for facilitating the vaporization of the fuel at the spraying nozzle. It consists of a metal bound flexible tubing in one end of which is a member so constructed that it fits over the air intake of the carburetor and is held in place by an adjustable ring and lock screw and nut. The other extremity is U shaped and is placed over the exhaust pipe where it is secured by means of two machine screws. By this arrangement heated air is taken from the exhaust pipe and drawn in through the tube to the carburetor, past the spraying nozzle. The hot, dry air not only effects a saving of gasoline but eliminates choking, condensation and freezing. It is claimed that sluggish motors will pick up quickly with the device and that climatic changes do not affect the action of the carburetor. Where a machine is not fitted with a pan or undershield it will prevent water and foreign elements being drawn into the vaporizer, thereby avoiding trouble from this source. The device is inexpensive and is applicable to any motor. It is manufactured by the Breeze Carburetor Company, Newark, N. J.



Star Tire Trunk



Becco Battery Connector

Col-Mac Hot Air Pipe

Freer Liquid Gauge

Waymaker Horn

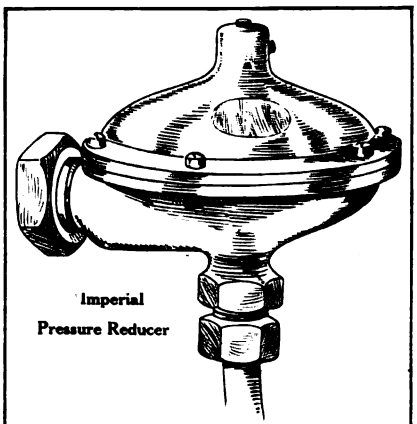
★

The Freer Liquid Gauge is designed to overcome carburetor troubles caused by the use of improper measuring devices, such as dirty sticks, etc. It consists of a reading dial fitted with heavy plate glass and calibrated to indicate the amount of fuel in the tank. An indicator moves freely over the face of the dial and is actuated by a float in the container, the float rising and falling, thus moving a rod connected with the registering member. It is adaptable to any type of fuel tank either gravity or pressure feed, and the glass member permits of noting the amount of fluid in addition to the indicator. It is produced by the Tanner Gage Company, Akron, O.

★

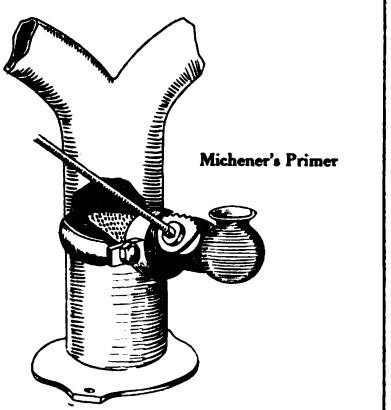
The Waymaker Horn is a new type brought out recently by the Lee Tire & Rubber Company, Conshohocken, Penn., and differs from the usual exhaust actuated members inasmuch as it is operated by a miniature rubber bulb located on the steering wheel or in any convenient place. Connecting the bulb and device controlling the exhaust gases is a flexible tubing wound with metal for protection. When the bulb is pressed a valve-like device allows the gases to flow into the horn, the amount depending upon the pressure exerted on the bulb. The signal is attached to the end of the exhaust pipe leading from the muffler and is easily and quickly fitted. The Waymaker horn is also made with foot control.

Digitized by Google



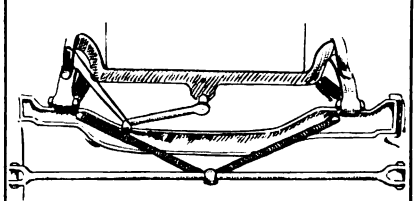
The Imperial Pressure Reducer is designed to reduce properly the pressure and to regulate automatically the flow of acetylene from tanks, the pressure of which may vary. It is a neat, compact device, attached to the usual connection of the tank and is so constructed that the pressure is reduced from 300 pounds to as low as two ounces. It delivers a steady, even flow of gas whether the container be empty or fully charged. It will appeal to motorists contemplating the fitting of an acetylene self-starting device as with the reducer the desired and necessary pressure may be obtained. It is made by the Imperial Brass Manufacturing Company, Chicago.

★

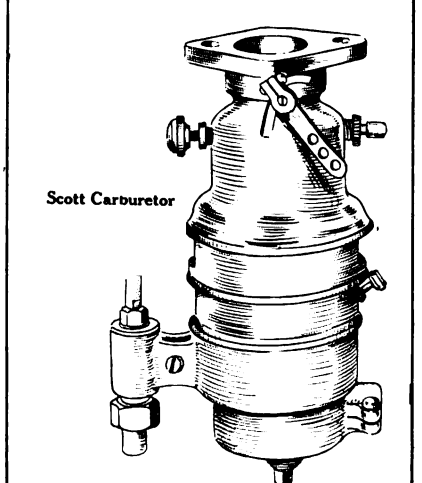


Michener's Gas Saver and Primer, made and marketed by E. S. Michener, New Castle, Penn., is a device for attachment to the intake pipe or manifold by means of a brass strap and lock nuts. It is hand controlled, and is fitted above the carburetor and operated from the dash by an adjustable rod. A wire gauze cone is incorporated, this being for the purpose of breaking up the fuel and for aiding in vaporization. The hand actuated valve permits of an opening ranging from zero to .5625 inch, admitting auxiliary air, and it is claimed that an economy of gasoline is effected thereby. A priming cup is incorporated for the purpose of facilitating starting in cold weather. The device is made of solid brass, highly polished, is installed easily and is not expensive.

★



The Little Steersman is a spring device designed for attachment to the tierod and axle so that in the event of an accident to the steering gear or the breaking of any of its components, the front wheels are kept in alignment. It consists of a helical spring, constructed of oil tempered steel wire, with attachments for the end and centre. The latter are drop forgings. It is claimed that the Little Steersman makes driving easy, and takes up automatically lost motion between the steering gear and wheels. It is nickel plated and does not detract from the appearance of the machine. It is produced by the Modern Auto Appliance Company, Chatham, N. Y.



Imperial Pressure Reducer

Michener's Primer

Little Steersman

Scott Carburetor

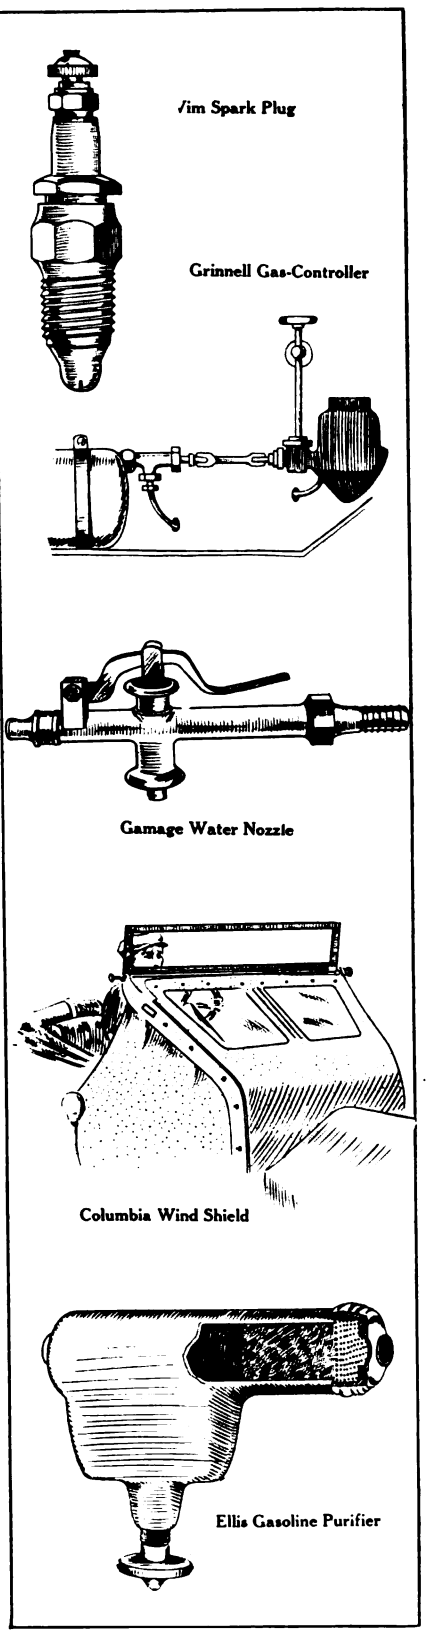
★

The Scott Carburetor, manufactured by the Scott & Sons Company, Medford, Mass., is a double needle vaporizer in which the auxiliary air valve is not actuated by a spring, and it is claimed by the maker that it supplies a correct mixture at substantially the same stress at all speeds and automatically adjusts itself to altitude. These qualities are obtained by the action of the auxiliary air valve which controls the high speed needle member, differing from those of ordinary form inasmuch as it is slabbed tapering on three sides, producing a like number of fine sprays and facilitating vaporization of the fuel. The valve moves in accordance with the speed of the piston, that is to say, it moves downward as the speed increases, and as the taper on the needle is inverted the flow of fuel is increased and vice versa. A feature is the fitting of a starting valve which may be operated from the radiator or dash. An air adjustment for high speed is incorporated over the auxiliary member and a low and high speed adjustment for the fuel. The only spring utilized is that in conjunction with the high speed needle and it is claimed that its operation is such that it is not impaired by long service. The maker emphasizes the fact that the carburetor is adjusted easily and that when once set requires no further attention.

★

The Vim Spark Plug, manufactured by the K-W Ignition Company of Cleveland, O., well known maker of ignition specialties, differs from the usual members in the manner in which it ignites the mixture in the chamber. The shell is hollow, providing a chamber into which the gas is forced by the compression stroke of the piston. There are four nar-

Digitized by Google



row slots across the bullet shaped nose of the plug, making for a concentration of heat around the firing point, and as the mixture is forced through this heat it ignites easily when the spark occurs. When this takes place a flame is shot out through the four slots into the vapor in the cylinder, facilitating combustion. Owing to the passage of the mixture the points are cleaned and it is said that sooting and fouling by oil is impossible. They are made with mica and porcelain cores in .5-inch pipe tap, metric or S. A. E. standard sizes.

★

The Grinnell Gas Controller and Igniter is produced by the G. C. A. Manufacturing Company, Pittsfield, Mass. As the name implies it is designed to regulate the flow of gas from the tank to the burners, and to light the latter from the seat by the turning of a small handle which is a part of the device. It includes the spark generating instrument and is neat and compact and attached easily to the frame of the car. Connecting the controlling mechanism and tank is a universally jointed rod which is provided with adjusting means so that in the event the pressure of the acetylene becomes reduced the proper flow to the burners may be secured. The lamps may be lighted and extinguished by a simple turn of the wrist, or dimmed as desired. The controller does not interfere with the operation of ignition system of the machine, being entirely separate, and the gas tank may be renewed in the usual manner. The burners are constructed to withstand hard usage and the spark points are held by brass springs, facilitating the removal and replacement of burners.

★

The Waste Not Water Nozzle has been brought out by A. W. Gamage, Ltd., London, England, to prevent an excessive waste of water when washing the motor car or other vehicles. It is fitted to the end of the usual hose and in place of the regular nozzle is provided with a hand cock and lever. Normally the water is shut off and to obtain use of the fluid the lever must be depressed. When released it automatically shuts off the supply. It is claimed that the initial cost of the device is saved in water bills in a short time as chauffeurs are prone to allow the fluid to run while performing other work in connection with the cleaning of the machine.

★

The Columbia Windshield is custom made by the Columbia Top & Tire Company, Boston, and is constructed both for the protection of the passengers in the front seats and the tonneau. When fitted to the latter it may be utilized as a light service table by folding back the upper part. It is made of flexible leather covering a light brass frame, steel lined, and the use of glass is avoided. Several adjustments as to positions are provided and it is claimed that the wind is deflected in such a manner that it does not strike the occupants of the rear seat.

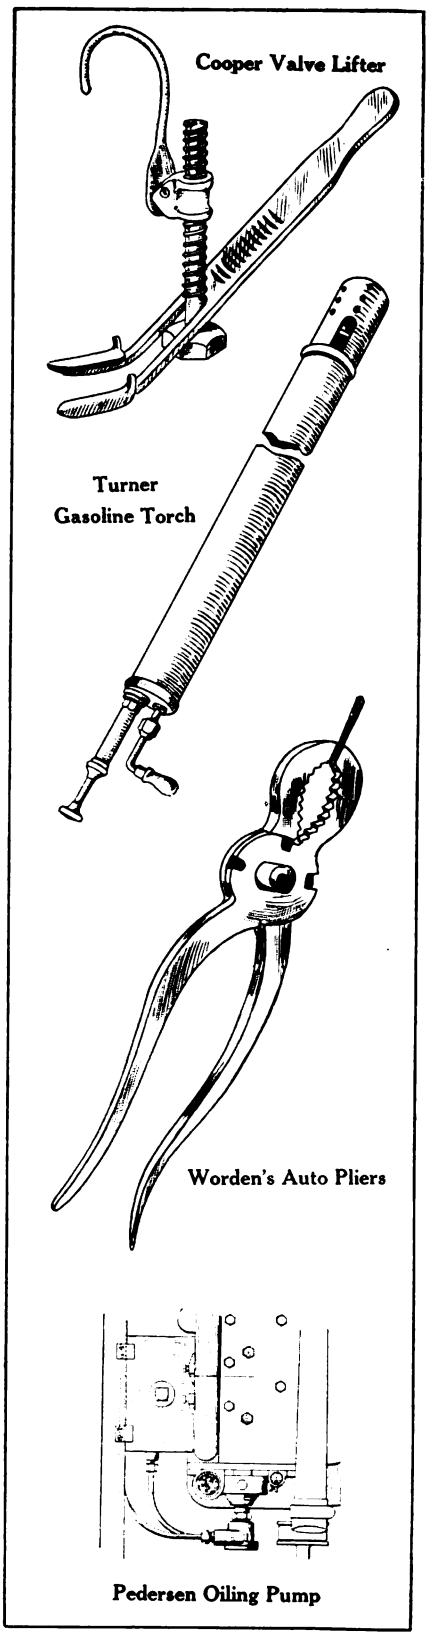
★

The Ellis Gasoline Purifier differs from a fuel filter inasmuch as the device not only separates water from the fuel, but kerosene and dirt. It is a compact device, weighing about six ounces and is inserted in the fuel line between the supply tank and carburetor. The gasoline first enters the precipitation chamber and is filtered through two fine screens, two felts and quartz. Any water in the gasoline will lodge in the precipitation space while the fuel, being lighter, will rise and flow to the vaporizer. The device is equipped with a knurled thumb screw by means of which accumulations of water, dirt, etc., may be drained easily and quickly. It is made of an aluminum composition and comes complete for attachment. The L. P. Rhines Company, Boston, is special agent.

★

The Cooper Valve Lifter is the invention of John J. Cooper, Providence, R. I., and differs from the usual tool of this nature in

Digitized by Google



that means are incorporated whereby the instrument may be locked securely after the valve spring of a poppet valve has been compressed, enabling the operator to use both hands in removing the cotter key or retaining members. The device consists of a U shaped member, one end of which bears upon the valve proper while the other extremity is fitted with a movable threaded screw rod. The lower end of the latter is recessed to take a lever slotted at one end and having a bearing upon an enlarged portion. The forked part of the lever is slightly upturned and is equipped with two tilting shoes pivotally mounted which are designed to be self-levelling and to bear evenly against the retaining member of the valve spring when the latter is compressed. The inner edges of the movable shoes are adapted to engage the rim of the collar of spring to prevent the lever from moving too far forward. The upper surface of the lever is fitted with deep notches for the purpose of engaging and retaining a brace member which is interposed between the serrations and threaded screw or nut. The length of the screw is such that the valve lifter may be utilized on any sized engine by changing its adjustment, which may be accomplished easily with the tool in position.

★

Worden's Auto Pliers, produced by E. M. Worden, Ladysmith, Wis., is a combination tool which will appeal to motorists and repairmen, it being stated by the maker that it represents 15 tools in one. Among the important offices which they fill are a pipe wrench, wire cutter, screw driver, nail puller, belt puncher, cotter pin tool, etc. They are constructed of a high grade of material, nickel plated and guaranteed by the maker.

★

The Turner Hot Blast Tubular Gasoline Torch is a new product of the Turner Brass Works, Sycamore, Ill., and is said to produce an intensely hot blast flame

easily controlled by a gasoline valve. Its construction is such that it is adaptable to a large variety of work. It is about five feet long, constructed of heavy gauge brass tubing, two inches in diameter, with a burner at one end and a pressure pump at the other. The long tube is utilized to contain the supply of fuel and holds about three quarts. A unique feature of the appliance is the controlling valve inside the tube which regulates the flow of the gasoline in such manner that the torch may be used in any position. A pump supplies air pressure in the fuel chamber. The size of the flame at the burner is 12 inches long and two in diameter. The torch weighs about 16 pounds and it is claimed that a quart of fuel will last an hour.

★

The Pedersen Oiling System for model T Ford cars is manufactured by the Pedersen Lubricator Company, New York City, and is similar in operation to the oil pumps made by this concern. It consists of an oil tank, pump, tubing and an adjustable sight feed indicator. The pump is attached to the timer shaft by a nut, this operation requiring the fitting of a new commutator cover which is a part of the equipment. The oil container is secured to the frame or any other convenient place near the motor and a pipe leads from the vessel to the pump and another to the indicator on the dash. Still another tube carries the lubricant from the sight feed member to a pet cock in the crankcase. When the motor is operating the pump draws lubricant from the tank and forces it to the dash device, equipped with an adjusting screw by means of which the amount of oil fed to the crankcase may be regulated to a nicety. As the speed of the engine increases the amount of oil pumped is in proportion and it is claimed that smoking is eliminated, as well as the necessity for refilling the crankcase. The pipes are cut to length and provided with connections ready to screw together and are attached easily.

PLEASURE CARS AS BUSINESS VEHICLES.

Experience of Springfield Water Department During Last Eight Years Indicates One Machine Will Do the Work of at Least Three Horses and at a Substantial Saving in Money and Efficiency.

WHILE it must be admitted that motor vehicles were first used for pleasure purposes, or at least their unquestioned practicability was demonstrated through such use, it is somewhat unfortunate that even the so-called pleasure car has come to be thus known. Because the general public has been accustomed to associate a touring car or runabout with thoughts of long distance riding or Sunday afternoon drives through the country, it is difficult to appreciate the utilitarian value of these machines. Many business men have been surprised to learn the economy which might be effected by the substitution of an automobile for the horse and wagon.

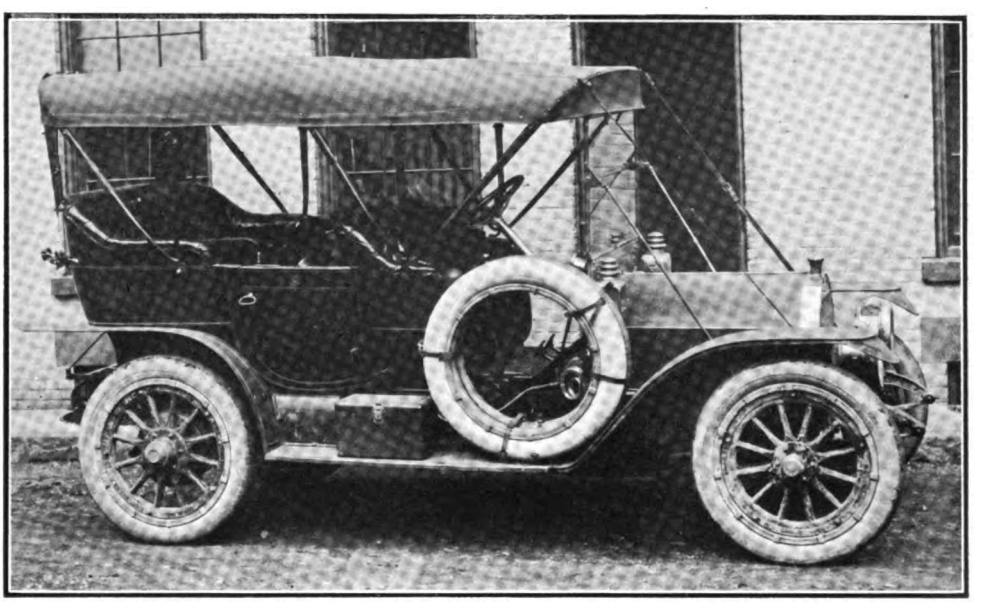
To cite an instance of this nature, mention may be made of one large farmer whose work is so subdivided that it is necessary that he shall visit each section of the work, practically that of an overseer. When using horses, he was compelled to keep three constantly in service, this necessitating even more in reserve in order that there should be no loss of efficiency. With one automobile he is able to do the work of these three horses, and finds time to spend two or three hours in his office daily.

The motor car has made a decided appeal with physicians, and while it was at first expected by them that they would be able to answer calls more quickly, thus saving time when time might mean the saving of human life, most of these physicians were still imbued with the pleasure car feature, expecting that it would afford them opportunity to get away from their work for indefinite periods during each day, thus giving a change and a needed rest. The result has been that they have increased their earning capacity by at least 100 per cent., by being able to answer more calls in a given time and to make visits in the country at a greater distance from the office.

These indefinite suggestions give a hint as to the possibilities of the so-called pleasure car as a business proposition. The average motorist has little conception of what the operation of his car is costing him, or how its maintenance compares with that of horses. In many instances it has been considered solely as a pleasure vehicle and as such of insufficient importance in a practical way to merit keeping an exact account of the expenditures. Presented herewith is a detailed statement of the cost of gasoline, tires, oil, repairs and overhaul charges on five machines operated by the water department of the city of Springfield, Mass., to the end of the last fiscal year. The length of time these cars have been in service is such as to give an excellent basis for comparison, and it is doubtful if a more complete set of figures of this character ever has been compiled for publication.

The first essential is to know something of the work these machines are called upon to do, and it will be found that with some of them this is decidedly more severe than in most lines of activity. The city of Springfield recently augmented its water supply by the construction of what is known as the Little River system. This involved the selection of a new water shed, and it was necessary to go some little distance from the city in order to secure one of sufficient possibilities, having in mind the future. The plans finally developed into the construction of three reservoirs, the Borden Brook, about 16 miles from Court square; Tunnel Mountain, 12 or 13 miles distant, and Proven Mountain, five miles out.

In the first place, all these various sites, and such others as might be considered available were surveyed. It ought to be mentioned here that the entire problem was under the direction of Chief Engineer E. E. Lochridge, although the specific work was done by assistants. This surveying was accomplished before permission to take the land was secured from the legislature, and very naturally dates back some years.



To go a little further into details: The Tunnel

Digitized by Google

Mountain reservoir eventually was located on Little river, between two high hills, and a tunnel, practically one mile long, was driven from the dam to the filter beds. The topography of this section was such that the engineers were forced to climb over rough ledges and through virgin forests in laying out the line for the tunnel and preparing for the construction of the dam. A house on the future site of the filter beds was purchased and utilized as a field station. This was approximately 12 miles from the department headquarters, and it is easy to understand that the chief engineer was forced to find some ready means of communication between the two.

The Borden Brook site was selected on meadow land, reached after traversing some three miles of deep woods, where the roads ran up hill and down dale, and were typical of country districts of this character. Grass had been allowed to grow between the wheel tracks and the latter were badly rutted. In order to reach the point on Proven Mountain where the distributing reservoir was located, it was necessary to construct a new road. Previous to its completion an old woods trail with many steep grades was utilized.

In July, 1904, the water department purchased its first automobile, a two-cylinder air-cooled Knox, made by the Knox Automobile Company of that city. It was used to convey the engineers to and from the field stations, and by chief engineer as indicated.

Knox Touring Car Utilized by Springfield Water Department in Little River Construction Work.

Although the Tunnel Mountain work was that first brought to a conclusion, it readily may be seen that considerable time still had to be spent on the other contracts, in order that all should be made to progress in logical sequence.

This little car was forced to climb hills, over roads that were by no means designed for automobile use, hardly more than woods trails in most instances. While no speedometer was installed, a conservative estimate of the ground covered each day would be not less than 25 miles, and often Sunday trips were necessary. It can be seen that a horse and buggy could not be depended upon for such service, even had it been possible to keep three horses, using one while the others rested. The road conditions would have interfered.

In December, 1906, the work had progressed sufficiently to warrant the purchase of a second machine, and this time a Knox four-cylinder air-cooled touring model was chosen. This supplanted the older car in the chief engineer's favor, but "Sarah," as it had been nicknamed by the employees, was still utilized in department work, making frequent trips to Little river, and when not busy in this manner, running around town to look after the work in charge of Supt. A. E. Martin. After being in service nearly six years it was sold at the end of 1909.

The accompanying table shows that during this time it cost the department $668.27 for gasoline, $1020.54 for tires, $53.48 for oil, $981.84 in repairs, $335.60 for overhaul work at the Knox factory; a total of $3059.73. Assuming that it was used for 5.5 years, this makes an annual expense of approximately $550. That it was in a saleable condition at the end of the period is of particular interest.

It will be noted that the item of tires was by far the largest, but this is not at all strange when the nature of the roads over which it was called upon to operate is taken into consideration. By reference to the table it is discovered that this tire expense fell off materially as soon as the greater portion of its time was spent in the city.

The touring car purchased in 1906 received the brunt of the Little River work until January, 1910, when a more modern water-cooled machine of the same make was purchased. The former still continued to make frequent trips to the various contracts for a time, but was converted into a tool wagon for the superintendent and again placed in service in October, 1911. During its four years of use as a touring car it cost the department $480.41 for gasoline, $786.34 for tires, $83.18 for oil, $588.63 in repairs and $632.37 for overhaul work, making a total of $2570.93. Dividing this by four gives an average

Digitized by Google

expense of about $640 for each year of service.

This was a five-passenger machine, and the new car which replaced it had a carrying capacity of seven persons. In the two years it has been in service it has cost $1580.19, or an annual expense of $790. Of this, $268.74 was for gasoline, $907.60 for tires, $44.17 for oil, $289.49 for repairs, and $70.19 for overhaul. It will be noted that the tire expense is much larger proportionately than with the two other machines. To gain the best information on this point, however, it is necessary to confine the comparison to the time in which each was employed exclusively on the Little River work.

The two-cylinder car was thus employed for 2.5 years at an average annual tire expense of $274.17. The average for the five-passenger car during its three years in the same service was $210.53, and for the seven-passenger machine, $453.80. It is noted in this connection, however, that the tire expense for this machine during 1911 was $555.48, practically double that for any one year with any other car owned by the department.

Tire equipment is an item from which it is not possible to secure the best comparison of results. In traversing such roads as these machines were called upon to undertake on this work one set of shoes might last much longer than another, simply because it was fortunate in escaping the dangers which the next encountered with surprising rapidity.

Perhaps a better method of comparison would be that of gasoline used, or repairs needed. In the matter of gasoline the two-cylinder machine had an average annual expense of $170.90, the five-passenger car $142.48 and the seven-passenger $134.37. The repair account shows the following: Two-cylinder, $282.41; five-passenger, $173.75; seven-passenger, $144.75.

Taking everything into consideration, the average annual expense of these machines in this work was: Two-cylinder, $769.05; five-passenger, $739.58; seven-passenger, $790.09. Leave the tire account out of the computation and the result is: Two-cylinder, $494.88; five-passenger, $529.05; seven-passenger, $336.30.

The department was so well satisfied with the machines that had been in service with the chief engineer, that in July, 1908, a Knox air-cooled runabout was purchased for the use of Supt. A. E. Martin in running about the city to look after the construction and maintenance work of the water supply there. This has had an annual expense of $290.98 for tires, $162.04 for gasoline and $752 for the total during its 3.5 years of use. This seems to compare very favorably with those utilized on the Little River work, and there does not appear to be any great amount of difference.

In April, 1911, a Hudson runabout was purchased for the assistant superintendent's use. As it had been in operation but seven months its figures are of but little service in making comparison with the others.

For the purpose of arriving at an average, it will be seen that the five machines have been in service a period equivalent to one machine for 15.5 years. This gives an average annual expense for each of the items as follows: Gasoline, $118.17; tires, $218.41; oil, $16.76; repairs, $194.28; overhaul, $109.58, and a total average expense of $657.20. Let it be assumed that the average cost of the automobiles was $3000, although it readily will be agreed that serviceable machines can be purchased for much less money. Inasmuch as it has been proven that the first car purchased was capable of giving at least six years satisfactory service, and they were thoroughly overhauled each year, an allowance of 10 per cent. for depreciation seems eminently fair.

The water department utilized no horse and buggy for this work, so it will be necessary to go elsewhere for figures on this class of service. An example will be taken from Springfield, and a firm in that city which utilizes 12 horses says the annual cost of feeding, bedding, etc., for one horse is $255.50. Shoeing adds $26 a year more, and repairs to harness and wagon $32.10. Horses are charged at $325 each, wagon at $150 and harness at $70. Depreciation is figured at 25 per cent. A comparison of costs, based upon the experience of the farmer who found that one automobile would do the work of three horses and leave time to spare for other duties, reveals the following:

Average Annual Expense with Horses.

Feed, etc., for three horses	$766.50
Rent	300.00
Shoeing	98.00
Repairs	32.10
Veterinary	24.00
Depreciation, horses, 25% on $975	243.75
Depreciation, wagon, 25% on $150	37.50
Depreciation, harnesses, 25% on $70	17.50
Interest, 6% on $1195	71.70
Total average expense for horses	$1591.05

Average Annual Expense with Automobiles.

Fuel	$118.17
Tires	218.41
Oil	16.76
Repairs	194.28
Overhaul	109.58
Depreciation, 10% on $3000	300.00
Interest, 6% on $3000	180.00
Total average expense for automobiles.	$1137.20
Balance in favor of automobiles	$ 453.85

So much for economy. In the matter of efficiency, there is no question that even with three horses it would have been impossible to duplicate the performance of the machines employed on the Little River construction work. The road conditions would have prohibited, even if the mileage did not. And it will be remembered that the farmer cited was compelled to keep a number of reserve animals in order to have satisfactory efficiency with his horse and buggy.

The figures presented by the Springfield water department are valuable because of their completeness. Everything has been included, but it is conceivable that these might be reduced somewhat by the owner who cared for his own machine. It is well known that in municipal work, the same personal attention

Digitized by Google

is not given that would be the case with a private owner. Repairs and adjustments that would be turned over to a repair shop in the one instance undoubtedly would be looked after at home in the other, making a corresponding decrease in the annual expense.

There can be little question that the use of the so-called pleasure vehicle for business purposes can be made to show a remarkable saving in economy and efficiency over horse equipment, just as the motor truck has demonstrated its superiority in its legitimate field. The principal source of expense is in the matter of tires, and it will be noted that in the case of the machines included in the accompanying tabulations, one-third of the entire total was occasioned by these.

However, the total mileage covered is a matter for consideration in this connection. It has been stated that the average daily mileage on the Little River work was at least 25, and probably it was decidedly in excess of this. The cars used inside the city certainly would make the total average nothing less than that. Sunday trips were included, but basing the estimate on 312 working days, the annual mileage is not far from 8000. This would give a cost of 2.7 cents a mile, which is by no means excessive. This calculation is far from satisfactory, because it will be admitted that the estimate of mileage is undoubtedly too low.

NEW LUBROLEINE CONTAINERS.

The Fiske Bros. Refining Company, New York City, is calling the attention of dealers and motorists to the fact that in the future its well known motor greases, heretofore sold under the name of Climax Synovia, Cup Grease, Phoenixo Gear Case Lubricant and Centaur Graphite Grease, are to be marketed in new lithographed packages under the trade mark "Lubroleine," which is the brand of its well known high quality motor oils. This company recently issued the fourth edition of its booklet, entitled "The Mission of Lubroleine," which describes these various lubricants and gives valuable information essential to the motorist in his selection of the proper oils and greases for the various types of automobile and marine motors. This booklet is mailed free upon request.

ENGINEERS REMOVE HEADQUARTERS.

After May 1, the headquarters of the Society of Automobile Engineers, which is now located at 1451 Broadway, New York City, will be removed to the United States Rubber Company building at Broadway and 58th street The offices and meeting rooms will be on the 12th floor which is now in process of construction. Out-of-town members will appreciate the convenience of the central location of the new quarters, as it is close to the Columbus Circle subway station, and the Sixth Avenue Elevated line.

RICHMOND DEALERS ORGANIZE.

Nineteen automobile dealers in Richmond, Va., assembled in the rooms of the Automobile Club of Richmond last month and organized the Richmond Automobile Dealers' Association. One of the objects of the new organization will be the holding of a motor car show in that city next spring. The officers follow: President, L. M. Foster; vice president, Joseph F. Leonard; treasurer, D. W. Richards; directors, L. A. Folger, R. B. Allport, Mark R. Lloyd and Nixon Ball. The office of secretary was left vacant for the present.

WILL EXPLOIT COLE CARS.

The accompanying illustration is that of Homer McKee, who has been appointed to succeed Lucius S. French as general manager of the Henderson Motor Sales Company, Indianapolis, in full charge of the advertising of Cole cars. As is well known the Henderson company is general distributor for the product of the Cole Motor Car Company of that city.

Homer McKee, General Manager, Henderson Motor Sales Company.

Mr. McKee has been a writer of automobile copy for a number of years, and his work has attracted unusual attention at the New York and Chicago shows. His style is intimate and his understanding of the demands of the industry broad in its scope.

Furthermore, he has had extensive newspaper and magazine experience, and is recognized as one of the best known men in the advertising business, particularly with motor cars.

Few American machines have had the benefit of more efficient exploitation than the Cole. Mr. McKee brings to his new position, not only an intimate knowledge of his chosen field and the Cole car, but a wide circle of friends and acquaintances who will join in congratulating him and the Henderson Motor Sales Company upon his selection to carry forward this work.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

THE AUTOMOBILE JOURNAL

VOL. XXXIII. APRIL 10, 1912. NO. 5.

Published the 10th and the 25th of Each Month.

William H. Black, Treasurer. D. O. Black, Jr., Secretary.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 W. 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurian, 4507 Clifton Avenue.
BOSTON—John W. Queen, 6 Beacon Street.

Subscriptions:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Ten cents the copy.

Advertising Rates:
Information given at request. All advertising copy to insure publication must reach this office 10 days preceding the date of issue.
Remittances should be made by Check, Draft, Postoffice, Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.
Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

THE MASSACHUSETTS LEGISLATURE.

Apparently the Massachusetts Legislature is intent upon curtailing the market for commercial vehicles in that commonwealth. Hardly had those interested in the development of this market succeeded in convincing the legislators that it would be unwise to limit the weight of trucks operating over the highways in that state, before Governor Foss sent a special message asking that the fees for motor car registration be materially increased. The sub-committee to which thas matter was referred has prepared a bill, which seems even more imprudent than the other.

Not only is it proposed to increase the fees on so-called pleasure cars, but these increased fees are to be applied to motor trucks under a horsepower rating, according to the present conception of the bill. President L. R. Speare of the Massachusetts State Automobile Association very wisely points out the injustice of any such plan.

Irrespective of whether owners and manufacturers of industrial transports will agree with this association in the suggested substitute rating as to load capacity, it is manifestly more fair than that contemplated by the proposed legislation. Unless given careful and judicious study any proposition to compel motor vehicles to bear the full cost of needed highway improvement is bound to result in discrimination against an important factor in modern economics.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

JERSEY PAYS FOR RECIPROCITY.

Non-resident motorists are in danger of overlooking one important feature of the so-called Stickel bill, under the terms of which they are to be readmitted to New Jersey for 15 days in any one calendar year. While the people of that state will reap the benefits of reciprocity when visiting other commonwealths, it is worthy of consideration that they will be compelled to pay a registration fee 50 per cent. greater than formerly in order to make up the deficit which is expected to develop because of the loss from non-resident special licenses.

Naturally, motorists in other states are much elated over the successful outcome of an agitation which has been going on for five years. New Jersey has been so far without the pale of reciprocity that most other states have advanced materially in this respect during that time, still the 15 days which non-residents are to be permitted to use the highways of that state is perhaps the best that could be expected under the circumstances.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

BAR HARBOR'S SURRENDER.

The deep rooted prejudice against the automobile, which has existed in certain quarters, seems to have been overcome in a measure. Bar Harbor, Me., has decided to admit the motor vehicles at least to within half a mile of the postoffice. This in itself is a decided concession, in view of the determined opposition which was manifest a few years ago when the Maine Legislature passed the act that occupied the attention of the state supreme court for a time at the behest of certain summer visitors at this well known resort. It even is conceivable that the time will come in the near future when automobiles will be permitted to operate in all sections of Mt. Desert Isle and the town of Eden.

It is of interest in this connection that staid old Nantucket, in Massachusetts, is said to have purchased a piece of motor propelled fire apparatus. The orig-

Digitized by Google

inal announcement of this information was met with the suggestion that it would prove difficult to overcome the provision of the state law, which not only forbids the operation of automobiles but prohibits their landing upon the island. Probably special permission will be secured from the Legislature now in session, and it is not unreasonable to expect that the residents will become so pleased with the vehicle that they will be desirous of securing the permanent repeal of the statute.

Motorists should see that their individual states require lights on all vehicles using the highways at night.

MOTOR FIRE APPARATUS.

The automobile industry is of such recent origin that few realize its enormous growth until brought face to face with some particular phase of the situation. It is not many years since the first automobile fire apparatus was placed in commission, but today there are in America 300 cities and towns in which over 600 motor driven machines are utilized in extinguishing fires.

Wherever the newer equipment has been tried there has been splendid interest on the investment, not only in the matter of maintenance but through quick propulsion, and prompt and efficient work.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

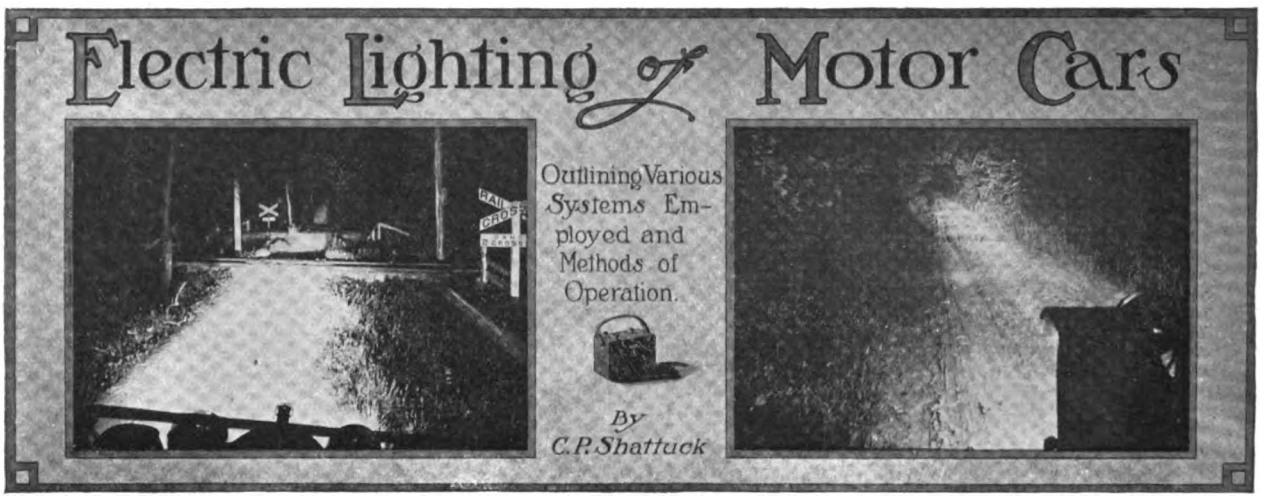
RESULT IN NEW YORK.

It has been some time since the Legislature in New York State has had as many opportunities to pass bills inimical to the interests of motorists, and it is subject for congratulation that final adjournment was taken before any of these were enacted into law. As a result of strenuous work on the part of organized motorists, the obnoxious propositions were killed in committee, and two very favorable projects were passed. Reference is made to the bill providing for the submission to the people of a proposition to issue $50,000,000 in bonds for good roads work, and that providing that detours shall be maintained around state road work in progress of improvement or construction.

It is somewhat to be regretted that the attention of the legislators and motorists was so far taken up in defeating objectionable measures, that the bill providing for lights on all vehicles using the highways during the night season, patterned after the very successful statute in Massachusetts, was not reached. This was important legislation and it was hoped that New York would add its support in favor of this movement for the safety of the public.

Other legislatures have similar bills before them, which have not progressed very far beyond the hearing stage. It would appear that the example set by the organized motorists in New York should indicate to those of other states in which the Legislature is now sitting that they ought to take this matter up without delay.

Universal lighting and uniform laws are the prime necessities for safe and sane motoring.



SEEING AMERICA FIRST.

There is decided merit in the resolutions passed by the boards of trade in the States of Utah, Wyoming, Montana and Idaho with respect to the opening of Yellowstone National Park for motor vehicle traffic. It is pointed out in this connection that should the national government follow the example of European countries, which give automobilists free access to all points of interest, American citizens would avail themselves of the opportunity to "See America First," thereby keeping millions of dollars in this country that otherwise would be expended in making annual tours abroad.

This is a phase of the situation which should appeal to the national government. As the matter rests at present, there is bound to be more or less disposition to question the right of any concessionary to monopolize the traffic of a supposedly public possession to the total exclusion of those who have the means and the inclination to enjoy these natural beauties in their own way. Transcontinental touring is bound to have a notable increase during the season of 1912, but the present policy in this situation assuredly is not encouraging Americans to spend their money at home.

Several of the states west of the Mississippi have become imbued with the doctrine of good roads, and while the citizens of these commonwealths are bound to reap the direct benefit of the funds thus appropriated, it is significant that they are doing their full part to encourage tourists from the eastern states. It is to be hoped that they will receive generous support from the national government, particularly as it is possible to grant such requests as that embodied in the resolutions to which reference has been made, without entailing any expense whatever.

Part V—The Remy Combined Lighting and Ignition System.

IN CONSIDERING the installation of an electric lighting system, the size of the generator, its position and method of drive are important factors. With the present day automobile some manufacturers make provision for the operation of a mechanical current generator and its fitting is consequently an easy matter. There are, however, machines not thus equipped and the installation of a lighting system using a generator may call for alterations to the power plant.

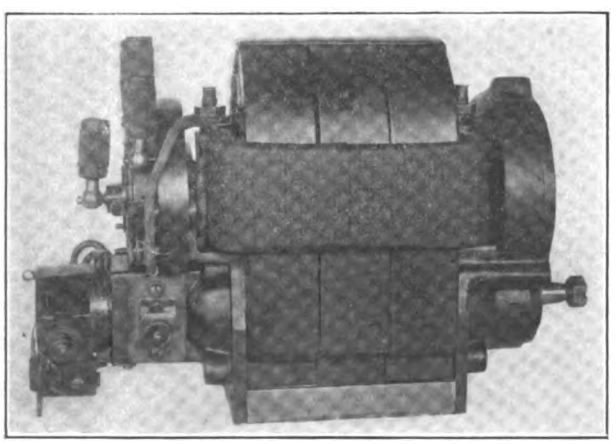

Fig. 31—Type B Remy Magneto Adapted to Four-Cylinder Motors, Outlining the Exciting or Field Coils Encircling Permanent Magnets.

In designing these systems the manufacturers have taken into consideration the fact that there are thousands of high grade cars in operation which have been in service one or more seasons, and while some of these lack the lines and equipment of the modern type, they are efficient and capable of meeting the requirements of the owner. And it is surprising to note that many of the machines are not fitted with a magneto, relying upon dry cells or storage batteries to furnish current for ignition.

While many of the power plants were designed so that a magneto could be fitted easily, the attaching and driving of an extra mechanical generator is a task which the class of motorists who equip their cars with modern appliances and perform the work themselves, hesitate to undertake because of the labor and expense that might be involved. To overcome this difficulty, combined ignition and lighting systems have been brought out, in which the magneto and generator are a unit yet operate independently of each other insofar as the two systems are concerned.

Features of System.

The Remy magneto light, made by the Remy Electric Company, Anderson, Ind., well known manufacturer of the ignition magneto of that name, is a combined system which furnishes a high-tension current for igniting the mixture in the cylinders and a constant source of low-tension electricity for the lamps, current to the latter being supplied by a mechanical generator when the motor is operating and by a storage battery when the car is at rest. The battery is floated on the line and is charged by the generator and by a clever, yet simple automatic regulator, the current cut in or out, this action depending upon the speed of the generator.

Provision is made in the dual ignition system for starting on the switch, and as a six-volt, 120-ampere storage battery, fully charged at all times, is utilized it is obvious that starting troubles due to a weak battery are eliminated. The system consists of a magneto, dash coil box, storage battery and a small distribution block with proper terminals for attaching the wires, also an auxiliary fuse block for attaching connections for an electric horn, speedometer, trouble or small lamps and electrical devices.

Two Models of Magnetos.

The magneto is produced in two models, that known as A being adapted for service on a six-cylinder motor, while B is utilized with four-cylinder power plants. The latter is depicted at Fig. 31 being similar in appearance to the usual Remy ignition

Digitized by Google

magneto with the exception that the horseshoe magnets are surrounded by field or exciting coils. The magneto is a direct current generator providing a low-tension current, which when used for ignition purposes is built up or strengthened by a transformer coil unit, carried back to the magneto and to a high-tension distributor, and thence distributed properly to the spark plugs. The system operates independently of the lighting equipment insofar as the use of electricity generated is concerned and were it not for the fact that the current utilized to light the lamps also is derived from the magneto it could be classed as a separate and distinct system.

The features emphasized of the ignition system of the magneto are: That it will furnish a hot spark at all speeds and that the motor may be so throttled that it scarcely revolves; that, being equipped with a 70-degree timing range, greater flexibility is obtained, and that the device is mechanically correct and fool proof, requiring no other attention than oiling every 1000 miles.

The current generated is a low-tension direct for lighting the lamps and for charging the battery. This is collected from the armature by brushes and regulated by an automatic controller which holds the current at eight amperes.

There are three sets of permanent magnets, each set comprising four horseshoe members and these are depicted at Fig. 35 A, being shown with the field or exciting coils and their connections. The two inner magnets are shorter than the others and rest upon the top of the base end illustrated at B. These magnets are of the finest grade of tungsten steel, heat treated and hardened in the company's own furnaces by a special patented process.

Function of Armature.

Attached to the base member are two pole pieces and within these is mounted an armature, which is

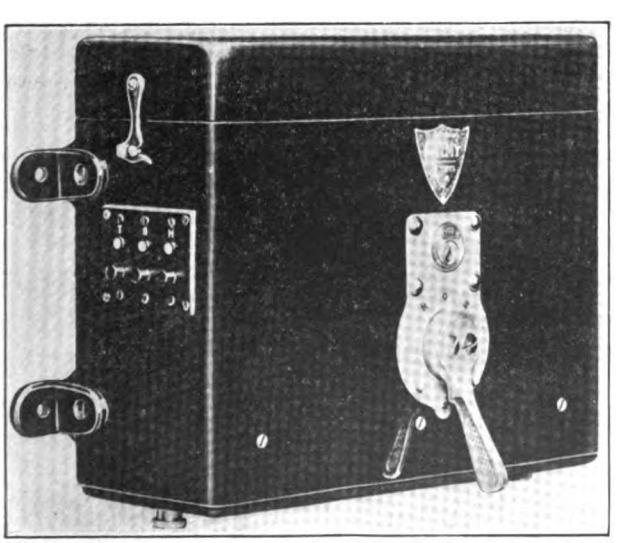

Fig. 32—Depicting Mahogany Coil Box, Kick Ignition Switch and Push Buttons on Side Controlling Electric Lights.

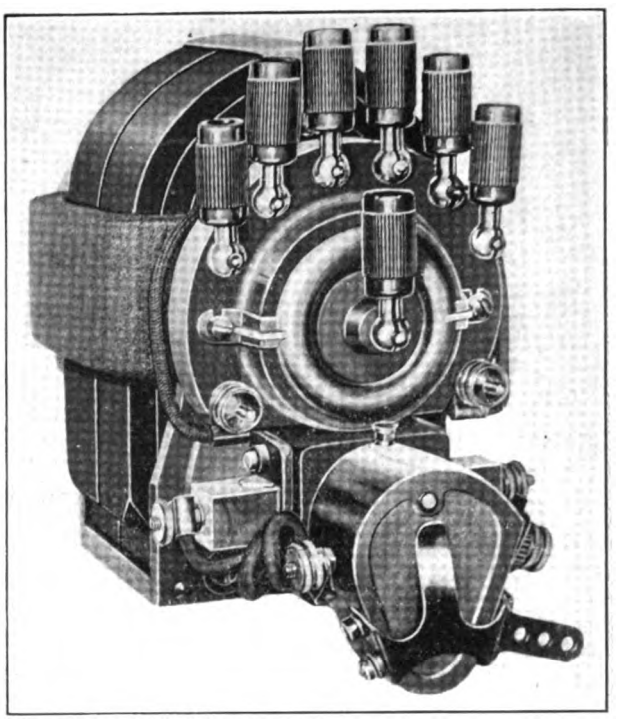

Fig. 33—Type B Remy Magneto Utilized with Six-Cylinder Motors.

illustrated at Fig. 36. This armature is drum wound on a laminated iron core and revolves freely upon ball bearings. It will be noted that one end of this member, which is made of the finest steel and ground accurately to size, has a taper shaft, cut for a Woodruff key, this arrangement making for absolute security of the gear rotating this member. Another gear is integral with the shaft and operates the distributor gear located above it. The armature is wound by a special process and the wires are treated by a compound, rendering them water, heat and oil proof.

The commutator is of liberal area and upon this member rest spring actuated brushes, the function of which will be explained later. Attached to the end of the armature shaft is a cam operating a cam lever and spring, which moves freely within a housing.

Distributor and Circuit Breaker.

Mounted over the armature and separated from it by a plate is a distributor shaft having two bearings. On one end of this shaft is fitted a gear which meshes with another gear on the armature shaft and both members are fully protected by a dust and moisture proof housing, and means are incorporated for oiling. At Fig. 34 B is depicted the distributor shaft and the carrying member, also the distributor, which is constructed of a heat resisting insulating material. Attached to one end of the distributor shaft is the distributor segment, this member being indicated by arrows for the purpose of noting in which direction the shaft is revolving and for facilitating the timing of the ignition.

The distributor housing is fastened to the frame

Digitized by Google

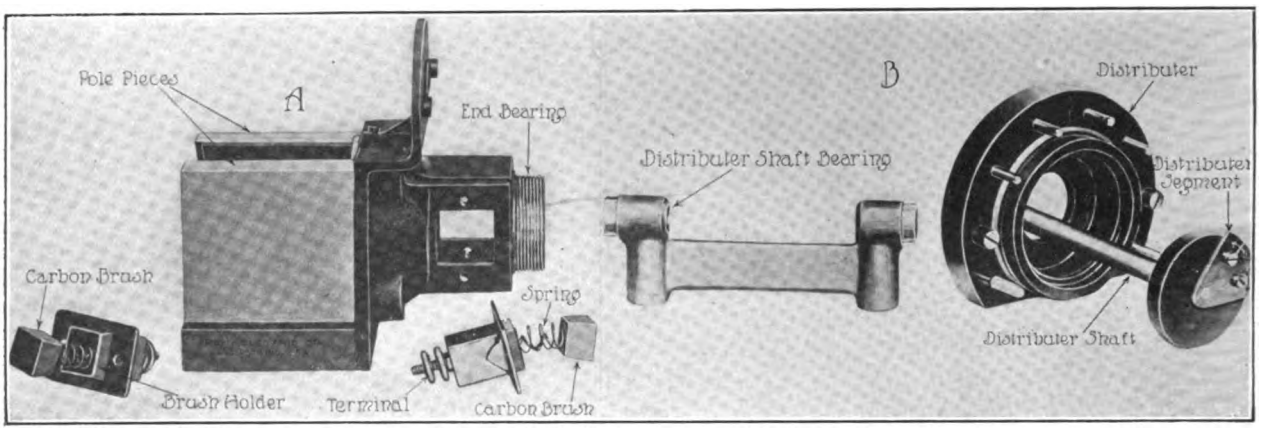

Fig. 34—Components of Remy B Magneto: A, Pole Pieces, Base End Bearing and Carbon Brushes; B, Distributor Shaft and Bearing, Brass Segment and Distributor.

of the magneto and access to it is by means of a lid, spring retained. A spring actuated distributor brush is connected to a secondary terminal to which is attached the wire leading from the transformer coil.

Mounted upon the armature shaft is the cam housing, shown at Fig. 35 B. This is a V shaped lever, pivotally mounted and carries a spring tipped with a platinum point normally in contact with another platinum point integral with an adjustable screw which is insulated. As the cam revolves it causes the normally closed contact points to separate twice during one revolution of the armature shaft, breaking the primary circuit. This circuit breaker device is so mounted that the housing may be moved to and fro by means of a lever integral with it and connected by a rod with the lever on the steering wheel. This is called advancing and retarding the spark; that is, the points are made to separate earlier or later, as desired by the operator, and as a 70-degree timing range is provided it is obvious that a greater flexibility of the power plant is obtained.

In practise the low-tension current, either from the magneto or battery, is allowed to flow until interrupted by the separation of the contact points, which movement induces a high-tension current in the transformer coil. This current is led back to the secondary terminal in contact with the spring actuated brush and distributed by means of the rotating segment to the proper plugs in turn.

Lighting Current.

With any mechanical generator utilized to charge a storage battery the current must be direct or if an alternating current be employed it must be transformed into direct by the use of a rectifier. A direct current is uniform in strength and direction, while an alternating one rises rapidly from zero to maximum, falls to zero again, reverses its direction, attains maximum in the new direction, and again returns to zero. After the flow of a current has been established the only opposition to movement is the resistance offered by the conductor to the passage of the current through it.

The direct current generated by the Remy instrument is collected by two large carbon brushes fitted accurately to the commutator surface of the armature. These members are depicted at Fig. 34 A, and it will be noted that the carbon blocks are contained in holders which fit into a recess in the end

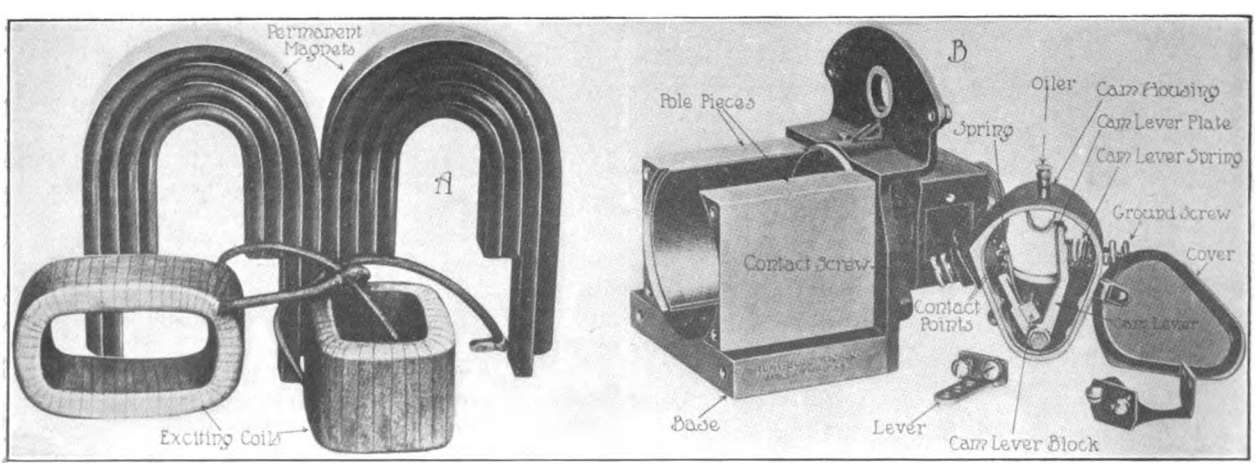

Fig. 35—Components of Remy B Magneto: A, Permanent Horseshoe Magnets and Exciting or Field Coils; B, Base, Pole Pieces, End Bearing Circuit Breaking Device and Cam House Cover.

Digitized by Google

bearing member. Connecting the terminal screw and brush is a spring which keeps the brush lightly but firmly in contact with the surface of the commutator, and a flexible cable is firmly attached to the brush and brush holder, insuring a positive connection.

Control of Electricity.

As the armature shaft is driven at crankshaft speed, it is obvious that the number of rotations varies. It may revolve at the minimum when the motor is operating slowly or at an exceedingly fast rate when the automobile is being driven at say, 40 to 60 miles an hour, and it is obvious that the amount of electricity generated by the magneto will vary correspondingly. If the current were led direct to the lamps and no means provided for its control, the lights would be dim at low and bright at high speeds and their value as an illuminant impaired, since in motor car lighting a steady light is desirable.

To secure efficiency from the bulbs a current of proper strength must pass through the filament and this flow must be steady. When the current is in

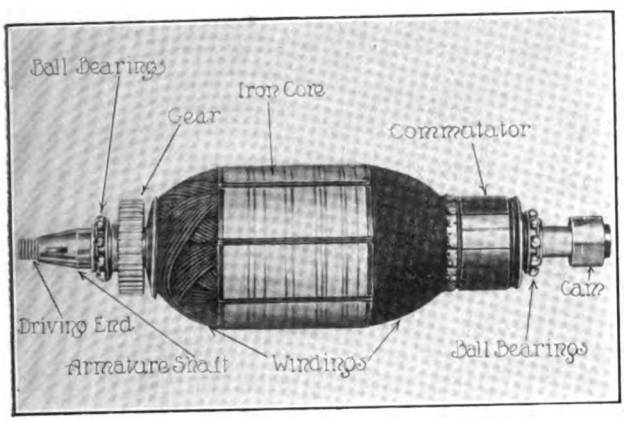

Fig. 36—Drum Wound Armature Which Runs on Ball Bearings and Which Carries Circuit Breaking Cam.

excess of the capacity of the filament the latter is destroyed or burnt out. Also, if the electricity were led to the storage battery it would have an injurious effect upon the plates of that number.

In the Remy system the amperage is held constant by automatically varying the current in the shunt wound, exciting or field coils around the magnets, thereby increasing and decreasing the intensity of the magnetic field to compensate for the varying speed of the magneto armature.

Automatic Regulator.

The current is held at eight amperes by the automatic regulator depicted at Fig. 38, which is located inside the coil box, shown at Fig. 32. This regulator is a carbon arrangement consisting of 10 carbon discs, one inch in diameter, held in place by four posts, but so arranged that they move freely; that is, they may be separated or held together closely, according to the movement of the armature member. The latter is pivotally mounted and actuated by an electro-magnet which has a series winding.

This acts at approximately eight amperes. That

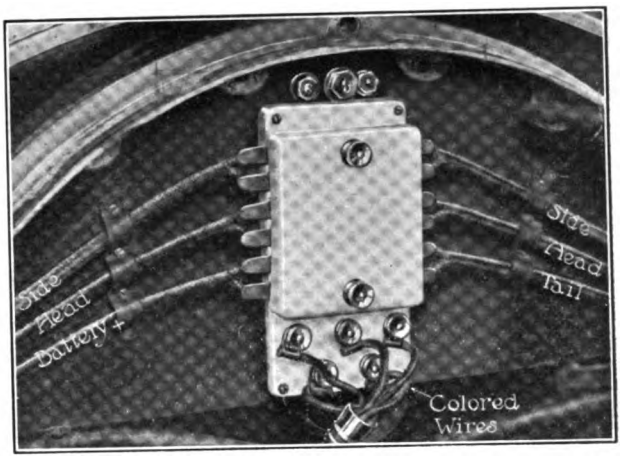

Fig. 37—Distribution Block Installed on Engine Side of Dash with Five-Way Cable Leads Attached.

is, the armature of the electro-magnet will pull down or overcome the resistance of the spring normally holding the member up when there are eight amperes flowing through the series coil. When these discs are in a normal position or compressed together there is little if any resistance to the current flowing, but when the pressure is released and the discs separate, the amount of resistance increases proportionately, this action being similar to that in a telephone transmitter.

The carbon discs are in series with the field winding of the magneto, and whenever the current through the field winding is decreased the magnetic flux is weakened, thereby reducing the electricity generated. The action is that of a field magnet, the field being weakened whenever the output reaches eight amperes. Should the motor of the car be throttled down below a speed sufficient to generate eight amperes, the electro-magnetic pull on the armature lessens, increasing the pressure on the discs. This makes a

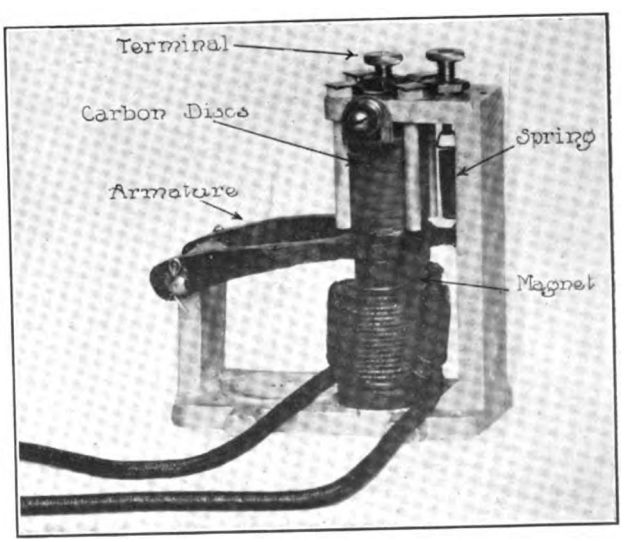

Fig. 38—Automatic Regulator Which Holds Current at Eight Amperes and Which Is Located Inside of Coil Box.

Digitized by Google

closer and closer connection until the carbon is practically a solid conductor, carrying all the field current. The instant the output of the magneto is not sufficient to carry the load, the storage battery supplies the required current, and this battery is automatically charged when the motor is running.

Storage Battery.

A six-volt, 120 ampere-hour storage battery is a part of the quipment, and this member is specially designed to meet and withstand successfully the hard service required of it on an automobile. It is adapted to the magneto and is constructed in two sizes, and may be placed upon the running board or suspended under the seat. The dimensions of the smaller member are, approximately, 10 by 7.5 by 14 inches. Those of the larger battery are 15 by 7.5 by 9.5 inches.

The dash coil box is of solid mahogany, highly polished and is provided with an ignition kick switch having three positions, namely, starting, off and running. When the lever is thrown into the starting position, current is furnished to the transformer coil through a vibrator and a stream of hot sparks passes between the points of the spark plug in the cylinder about to fire. When the motor is started the lever is moved over to the running position, which disconnects the vibrator, and current is then supplied by the magneto.

On the left hand side of the coil is located the lighting switch. This consists of two rows of three push buttons, the upper members being white and the lower black. The former light the tail, side and headlights and these may be used separately or in groups as desired. To extinguish any group a black button is operated. An individual Yale lock is incorporated in the coil box enabling the operator to lock the ignition securely, and two keys are furnished with each equipment.

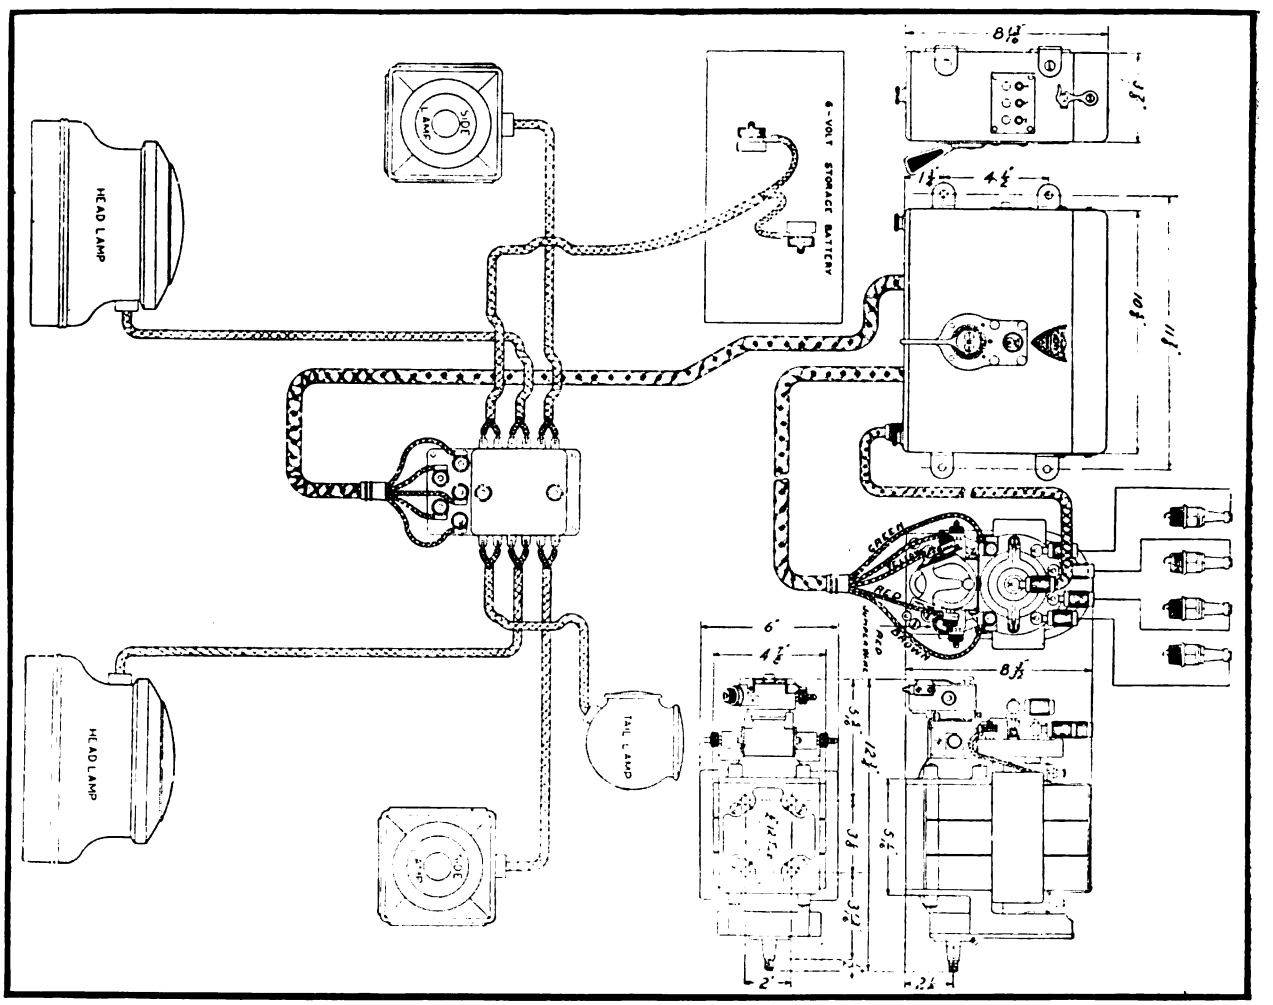

Fig. 30—Depicting Wiring Diagram for Model B Magneto—Each Wire Is Colored and Corresponds with Terminal of Similar Color, Making for Simplicity and Proper Installation of System.

Simplicity of Wiring.

One of the features of the Remy combined ignition and lighting system is the simplicity of the wiring. All of the leads are colored differently as are

Digitized by Google

the connecting terminals and it will be seen that it is impossible to install the system incorrectly. Where there is a multiplicity of wires these are conveyed in cables and one of these members leads from the coil box to the magneto and another to the distribution block. The latter is installed on the engine side of the dash and its terminals are so plainly marked that proper connections are made easily. This member is depicted at Fig. 37 and it will be noted that it is substantially constructed and occupies but little space.

As previously pointed out, the magneto may be operated in either direction, clockwise or anti-clockwise, this arrangement also simplifying installation. The magneto is gear driven, and a feature emphasized is that it has only one adjustment, that of the contact screw of the timer, which is so designed that an accurate adjustment is made easily, and it will not jar loose from its position.

Care and Attention.

The cams are constructed of chrome nickel steel, ground accurately to size, both inside and out, and fit the shaft perfectly. They are hardened in a special furnace equipped with a pyrometer. All cams are uniform in weight, size, shape, strength and wearing ability, and with a few drops of oil are claimed to possess enduring qualities. The cam and cam plate are lubricated by means of a felt wick and this requires attention but once a season. Four oilers are fitted to the magneto and these require but a few drops every 1000 miles.

At Fig. 39 is presented the wiring diagram for the model B magneto and the best cable is employed throughout. The connections are clean, neat and firm, insuring reliability. The output of the magneto is such that in addition to furnishing current for ignition it permits the use of lamps of large candlepower. The use of 16 candlepower lamps, of 2.5 amperes each, is recommended for the headlights and two candlepower bulbs for each of the side and tail members. An auxiliary fuse block for connecting leads for horn, speedometer or other lamps or electrical devices is furnished if desired.

The Remy magneto light is absolutely guaranteed as to the service it will render and the quality of materials used in its construction. Every machine is tested before it leaves the factory and a feature of the Remy Electric Company is its service department with its corps of specially trained experts. Branch houses are established in all of the leading automobile centres enabling the user of Remy products to receive prompt and efficient attention, and these stations also carry a full line of parts and supplies.

(To Be Continued.)

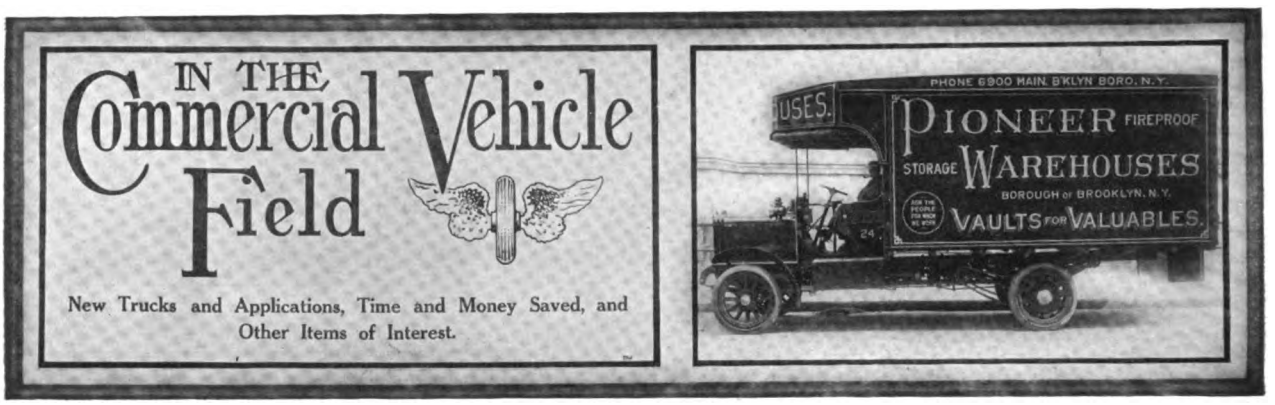
NEW ENGINEERING FIRM.

Announcement is made that Henry F. Donaldson, president of the Society of Automobile Engineers, and Joseph Tracy, a well known consulting engineer in New York City, have associated themselves as automobile engineers to undertake consultation, research and development work, design and construction, laboratory and road tests. For the present headquarters will be maintained in the office already established by Mr. Tracy at 116 West 39th street, New York, and the testing laboratory in New Jersey will be retained as heretofore.

SUCCESS WITH LENOX CARS.

Few young men have had better success in the sale of automobiles than William Blanchard, who has just been promoted to become sales manager for the Lenox Motor Car Company, 3368 Washington street, Boston, Mass., maker of Lenox cars. He has been associated with this concern less than a year, and during that time has demonstrated his remarkable ability along this line.

Mr. Blanchard has been connected with the motor car industry for the past five years, and has a wide circle of friends and acquaintances, particularly in the New England states. Undoubtedly, a large measure of his success is traceable to this fact, although he possesses personal qualities which make him one of the best salesmen in this district.



William Blanchard, Sales Manager, Lenox Motor Car Company.

Perhaps the greatest secret of all is his thorough familiarity with the construction of an automobile. He gained his rudimentary knowledge of motor cars with the Easton Machine Company, Easton, Mass., maker of the Morse car. Here he worked in every department, serving his full time at the bench and in the shop. It was while acting as salesman for Morse cars that the Lenox company induced him to undertake the exploitation of the Lenox line.

Peoria Club Organized—The motor car owners of Peoria, Ill., have organized the Peoria Automobile Club, with the following officers: President, E. J. Case; vice president, W. C. Collins; secretary and treasurer, Charles E. Ulrich; directors, W. E. Hull, H. C. Roberts, R. H. Johnson, Carl Block, Dr. F. B. Waugh, H. B. Pinkerton, H. G. Herget, S. K. Hatfield and S. L. Nelson.

THE HANSEN GAS TURBINE.

In an effort to secure more power, less weight, elimination of noise and reduction of complications several inventors have been engaged upon the problem of the gas turbine for some time. The progress has been rather less noticeable in America than abroad, but it is worthy of mention that some degree of success has been attained. This is particularly true of the design perfected by Friedrich Hansen of Hamburg, Germany, who feels justified in announcing that he soon will be able to offer to the automobile industry a thoroughly tested, practical motor of this type.

It will be understood in the first place that there

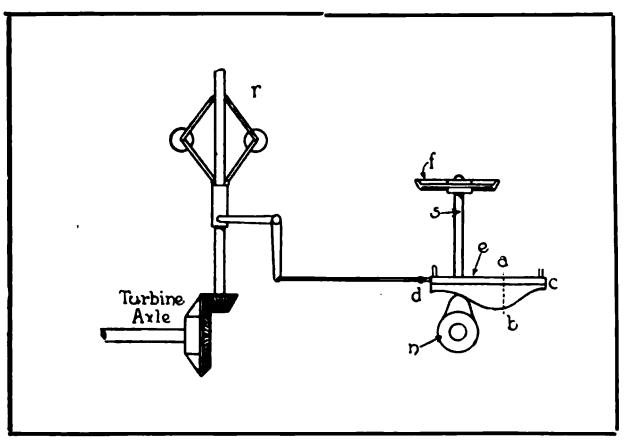

Fig. 1—Regulator for Controlling Charge in Gas Turbine.

are several difficulties to be overcome in the construction of a practical gas turbine. The experiments thus far made may generally be classed under two somewhat distinct branches of design, one based upon the principle of a continuous burning of the gas and air mixture within a closed chamber, by means of which the gases are expanded and forced to and through the turbine wheel, and the other on the principle of the explosion chamber, in which the mixture is exploded at rapid intervals. The first is the simpler and has been the subject of much study, although the second appears to have been the more successful.

The Hansen turbine, shown in accompanying illustrations, is of the latter type and is of what is known as the multiple explosion chamber design, in which the three cylinders are assembled in such manner that they constitute one revolving chamber. Among the difficulties presented with this type is that of the rapid valve action necessary immediately after the explosion, and it has been found that only the automatic inlet valve can be used.

How It Operates.

The operation of this type of gas turbine is as follows: By turning the turbine wheel by hand a number of times, air is forced through the explosion chamber, valves and flanges of the turbine wheel. After a sufficient number of turns, the gas valve will open and fuel will be drawn into the chamber, forming an explosive mixture. Immediately after the gas valve is closed the spark plug will ignite the mixture, which expands and closes the air valve. The two valves are located one within the other, and as soon as the pressure of the expanded gas has left the cylinder, they will open again and a new charge of gas and air is taken in. This fresh charge not only possesses the advantage of driving the remainder of the old charge into the wheel, but it also has the effect of cooling the chamber and valves, which otherwise would become too hot for continued use.

It will be seen that the conditions surrounding the use of the automatic inlet valve here are much different than in a gasoline motor of the piston reciprocating type, since in that case it is closed by the compression stroke of the piston. In the turbine, this compression does not exist, and the valve must be closed entirely by the pressure of the explosion, and the greatest difficulty lies in that these valves generally are too heavy and complicated in design to be able to close with a speed equal to that of the exploded gas.

Engineer Hansen claims to have overcome this difficulty, as well as to have solved the problem of proper regulation of the gas and air mixture with reference to the different speeds of the motor. In this latter device, Fig. 1, a sliding member e with a cam shaped lower face is interposed between the valve spindle s and a cam n. This sliding member is operated by the regulator r, which is in turn driven by the turbine shaft.

Digitized by Google

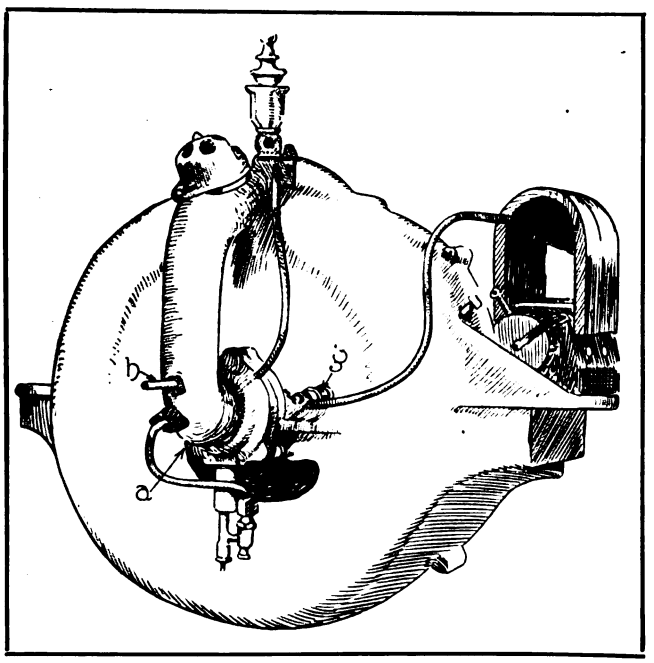

Fig. 2—Inlet Side of Gas Turbine Constructed by Friedrich Hansen of Germany.

The proportions of cam surface on the member e represent the different openings of the valve. The portion of this cam to come between the spindle and cam n at the highest speed of the motor and therefore at the greatest opening of the valve, is represented by the dotted line a-b. From b to c represents a movement of the sliding member when the speed of the turbine has exceeded the normal, in which case the valve opening would be reduced or entirely closed. The curve from b to d indicates the various openings for empty running and for normal revolutions.

Details of Construction.

Referring now to Figs. 2 and 3, it will be seen that provision is made for the admission of air and fuel, the latter being either gasoline or kerosene, through the specially contrived valve in the axle of the turbine, this mixture being forced into the explosion chamber through a spray pump a. The explosion operates in reaction valve reversing chambers, passing through the flanged wheel to the open air at the exhaust tube e, seen at the bottom of the casing in Fig. 3. The spark plug f is used for firing any gas which may escape in the casing of the flanged wheel when the turbine is being started. Spark plug g constitutes the point of friction contact which conveys the firing current to the friction points of the spark plugs fixed to the explosion chambers, as they revolve with these chambers past the plug g.

The rapid revolutions of the chambers, assisted by the ventilator which also revolves with the main axle, generates a forceful air current which has proven sufficient to keep the power plant cool and in good working condition. The cooling air, which has a pressure of a 24-mm (.94-inch) water column at a turbine speed of 1200 revolutions a minute, is exhausted from the tube h. For the purpose of allowing this cooling air to circulate through the parts, the axle is hollow and connected with the explosion chambers at three points only.

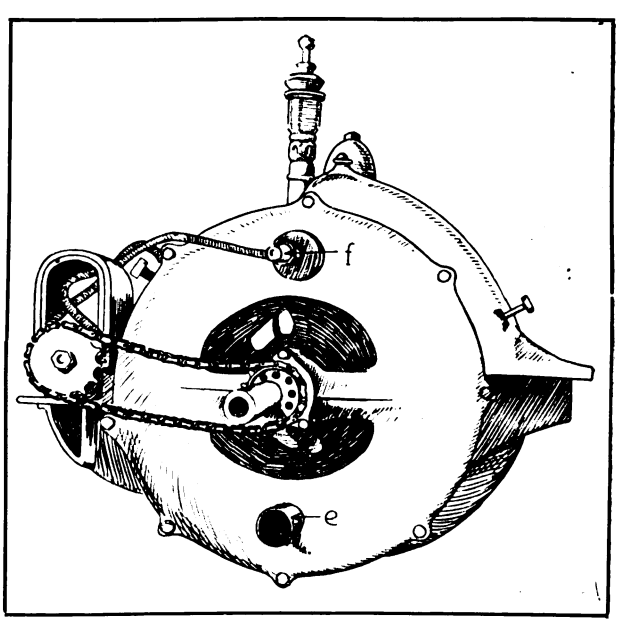
At first, the air which was heated by its circulation through the turbine, was used for the fuel mixture as well, but it was found that cold air must be employed for this purpose, owing to the fact that the hotter was the air the lighter was the fuel mixture. The much greater expansion of the cold air on entering the chambers added materially to the power of the engine, and it was only after making use of this that practical results were attained.

It is anticipated that this type of gas turbine will find its utmost practicability in heavy duty vehicles, and the fact that it will operate on kerosene as well as gasoline is expected to make its success even more assured. The matter of transmitting energy will have to be given serious consideration before the gas turbine will be accepted generally, but it is suggested that this may be overcome by the use either of electricity or oil hydraulics.

AVAILABLE FOR LIGHT DELIVERY.

Among the manufacturers of commercial vehicles who have turned their attention to the production of light delivery wagons is the Available Truck Company, Chicago, which makes the Available truck in two sizes, of 1500 and 2000 pounds capacity, respectively, and with a wide variety of body designs. An accompanying illustration presents the larger of these two chassis fitted with open grill body.

Particular attention has been paid to the matter of power plant, the motor in each of these models be-



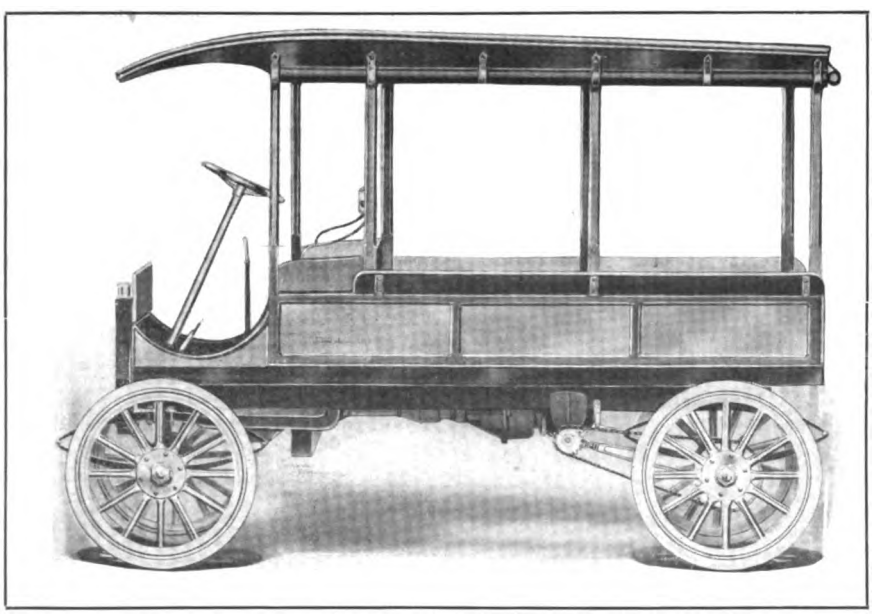


Fig. 3—Exhaust Side of Hansen Turbine of the Multiple Explosion Chamber Type.

Digitized by Google

ing designed especially for the work which it is called upon to accomplish In the smaller car, the engine has a bore of five inches and a stroke of four, being of the water-cooled, two-cylinder, four-cycle type. The connecting rod bearings are of brass, babbitt lined, while the other bearings are of Parsons' white brass.

The oiling system comprises a reservoir of 2.5 gallons capacity, located in the crankcase, from which the lubricant is circulated by means of a centrifugal pump driven by the camshaft. The radiator is of the square tube type, extra large, and is guaranteed to keep the motor cool at all times. The drive is by shaft to the jackshaft, thence by two Diamond roller chains to the rear wheels. The transmission is planetary, and is a unit with the jackshaft. Both sets of brakes are located in the rear wheels, the emergency members being of the expanding type and the service, contracting.

The larger model is similar in design, but is made heavier throughout. The motor has a bore of 3.25 inches and stroke of four, and employs the same circulating oiling system. The brakes consist of 10-inch service members on the jackshaft and 12-inch emergency brakes on the rear wheels.

Available Light Delivery Wagon of One Ton Capacity, with Open Grill Body.

In keeping with the demand for some method of regulating the speed of the truck in the hands of the operator, a centrifugal governor is fitted on both models. This is directly connected with the butterfly valve in the intake valve just above the carburetor, and when set to any certain speed it is impossible for the driver to exceed that limit without the knowledge of the owner.

A particular feature of the Available equipment is in the matter of tire size. Wheels are 34 inches in diameter and solid rubber tires are fitted. On the smaller vehicle an option of two or three inches is allowed as to cross section. With the larger model this choice is from 2.5 inches to four.

The maker has found that the vehicle shown herewith has made a decided appeal with the furniture concerns, and has arranged to provide a standard body for this purpose. This has a loading space of 44 by 108 by 24 inches, with a 22-inch tail gate, which extends the available length to 10 feet 10 inches.

MOTORS IN PATAGONIA.

Those who are interested in the exploitation of southern Patagonia, which has been developed as a rich farming country, are deeply concerned with motor haulage, although it has been difficult to find machines that were thoroughly suitable for the work. Unfortunately, the first American machines which were taken to this country proved too light in construction to make their service satisfactory over the rough roads. Four other machines, all of foreign construction, are employed as tractors with fair success. The Sociedad Explotadora de Tierra del Fuego is utilizing steam vehicles on its Ultima Esperanza section and one steam and one gasoline machine are operating between the ranch and Rio Gallegos and Guer-Aike, a distance of 21 miles, the first hauling seven tons and the second, loads up to 25 tons.

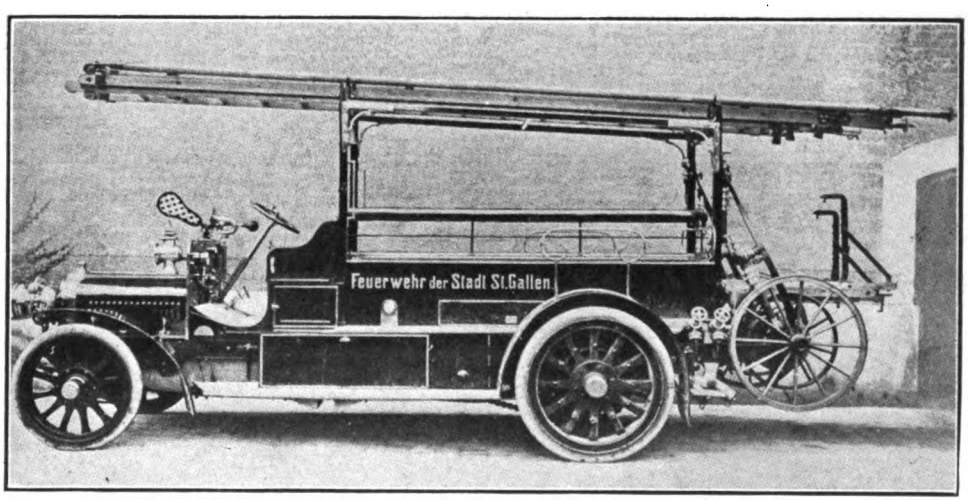
It is said that this field offers an excellent market, inasmuch as it is impossible to employ bullock teams, owing to the scarcity of grass. This condition seems strange, when it is learned that other crops grow easily, and the farmers of that section are anxious to obtain some satisfactory means of hauling their products to market. Road conditions offer the principal obstacle to satisfactory motor haulage.

PEERLESS TRUCK PROVES SATISFACTORY.

An excellent example of efficiency in a commercial vehicle has been demonstrated by the Peerless three-ton truck, made by the Peerless Motor Car Company, Cleveland, O., and in service with the M. Sweeney Company, Fall River, Mass. This machine has been operated practically night and day with two shifts of men for more than a year, and has travelled over 9000 miles.

During the day it is employed in general trucking and moving household goods. On Sundays, in the summer, passenger seats were fitted and it took excursionists to beach resorts. During the strawberry season it regularly carried two truck loads of berries to Providence, R. I., each night.

Digitized by Google



It is claimed that the first tire renewal was a new rear set at the end of 9100 miles. The owner is so well suited with its performance that a duplicate order has been forwarded to the Peerless company.

SAURER FIRE APPARATUS.

During the progress of the commercial vehicle show in the Madison Square Garden, New York City, the International Motor Company of that city announced that the Saurer fire apparatus, which has given excellent satisfaction in Europe, would be manufactured by it at the Saurer plant in Plainfield, N. J. The vehicle on display at that exhibition was a combination wagon carrying a pumping engine, similar to that shown in the accompanying illustration and in service at St. Gallen, Switzerland.

Since the show, this vehicle has been subjected to numerous tests in various parts of the country. In one of these tests at Broad Brook, N. J., recently, it was called upon to deliver water through six lengths of fire hose in competition with the steam fire engines in use there. When connected to a city hydrant, where the water pressure was about 65 pounds, the pump drew down to less than 30 and raised the pressure at discharge to 136 pounds.

The vehicle is propelled by a 60 horsepower motor. The pump is of the centrifugal type, and is said to be capable of delivering 500 gallons of water a minute at a pressure of 150 pounds. Two suction connections are provided for the purpose of taking water either from a hydrant or a stream. The pump is located at the rear of the chassis and is controlled by a hand lever.

Saurer Pumping Engine in Service at St. Gallen, Switzerland, Duplicates of Which Are to Be Constructed in This Country.

CARTERCARS FOR FIRE CHIEFS.

Inasmuch as Detroit is regarded as the centre of the motor vehicle industry, it follows when a manufacturer sells a motor car in that city it must be sold on its merits. The competition is keen, and those whose plants are located outside the city are forced to produce machines which are able to withstand severe tests if repeat orders are to be expected.

Seven years ago the Detroit fire department selected two friction driven Cartercars, made by the Cartercar Company of Pontiac, Mich., for the use of its district chiefs. They have been employed steadily for seven years, being subjected to severe usage, and have fulfilled every requirement so well that the department has purchased five more for same purpose.

INTERESTING KNOX FIGURES.

An instance of a six-ton Knox truck, made by the Knox Automobile Company, Springfield, Mass., paying for itself in less than a year is cited by Charles F. Barrett, assistant sales manager of that concern. The owner was a large trucking concern in a western city, which had a contract for the removal of the city garbage, refuse, etc., three miles outside to a reduction plant in the outskirts.

For five years this work had been done by horses, and as the company was contemplating the installation of mechanical transports, accurate account of the cost of operating was kept. It was found that in order to do the work successfully with horses, it was necessary to employ five two-horse teams each of three tons capacity. Four of these teams made three round trips daily, or 18 miles, while the fifth made four trips or 24 miles. Each of the five teams alternated in making the extra trip. With this arrangement, which was found to be the most economical, the daily cost, including drivers' wages, repairs, depreciation, interest, etc., averaged $6, or a total for the five teams of $30.

The company purchased a Knox six-ton truck, fitted with 50 horsepower motor, and was able to move the entire 48 tons of refuse in a working day of 10 hours, supplanting the five two-horse teams and their drivers. Very liberal allowance was made for tire repairs, depreciation, wages, etc., and the daily cost figured out close to $15. It thus effected a saving of $15 a day, without any loss in efficiency, or actually paid for itself in 347 working days.

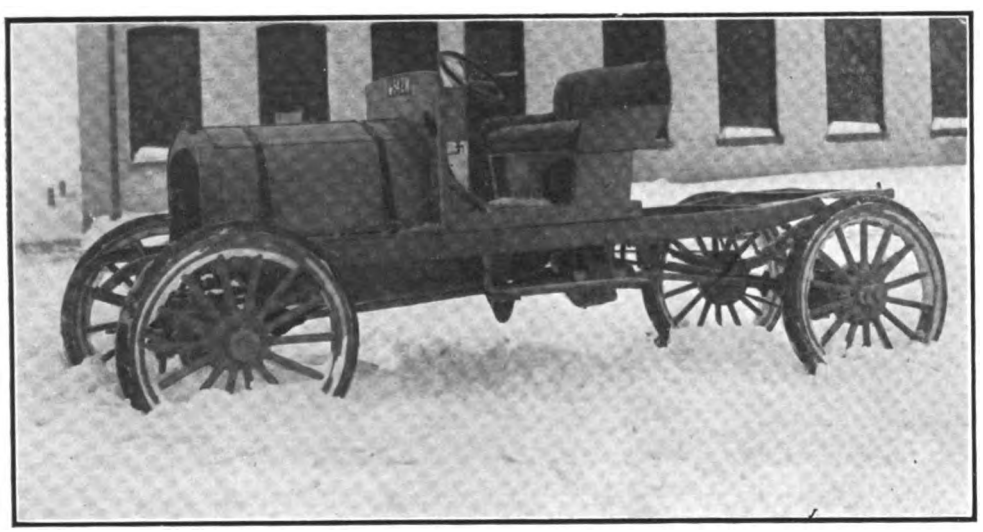
A LIBERAL GUARANTEE.

Prospective purchasers of motor trucks are much interested in the written guarantee supplied by the maker when making a sale, and it may be said that many manufacturers have given this subject extended study. Naturally, the tests to which the vehicles are subjected before being placed upon the market enter into the consideration of this feature. The Jarvis-Huntington Automobile Company, Huntington, W. Va., maker of the Jarvis-Huntington line, has gone a step further than some manufacturers in this regard, and presents the following guarantee, which is expected to make an appeal to the man who is investigating the subject of motor haulage:

"We guarantee our trucks against defective material and workmanship for 10,000 miles, to the extent that we will furnish, free of charge, new parts in exchange for defective parts, provided said defective parts are returned to us, charges prepaid. This guarantee does not apply to tires, electrical equipment, wear and tear, accidents or misuse of trucks.

"JARVIS-HUNTINGTON AUTOMOBILE CO."

SELLS TAXICAB BUSINESS.



The New York Transportation Company, New York City, has sold its taxicab business to the Conneticut Cab Company of that city, which has had a large number of cabs in service for a number of years. The purchasing company will take possession June 1, adding to its already well equipped line, more than 600 vehicles, the stations and good will of the former concern. The statement of President W. R. Meade of the New York Transportation Company, in this connection is of special interest, as follows:

"Since the adoption of the motor omnibuses on Fifth avenue, that branch of this company's business has developed with amazing rapidity. We have for a long time felt the necessity of concentrating our efforts on the Fifth avenue omnibus line, for the benefit both of the stockholders and of the public. Such concentration was manifestly impossible with the attention of the board divided between the omnibus line, the taxicab and livery business.

"While I do not care at this moment to go into particulars as to our arrangement for the development of the Fifth avenue omnibus business, I am willing to say that the improvements made there will, we hope, within the next few years be even more important and noticeable than the change from horse to omnibus traction. The advantage, both to the stockholders and to the public, will be marked and important."

FOUR WHEEL DRIVE TEST.

During the recent tests conducted by the United States government to determine the value of commercial vehicles for army service, a Four Wheel Drive truck of 2500 pounds capacity, made by the Four Wheel Drive Auto Company, Clintonville, Wis., was among those entered. The entry was made upon order from the War Deparament, a special representative of which visited the factory for the purpose of investigating the merits of the machine. Owing to the limited time allowed in complying with this order the chassis was fitted with a remodelled touring body, as shown in an accompanying illustration.

Four Wheel Drive Truck Which Competed in Recent United States Army Manoeuvres.

The vehicle is equipped with a four-cylinder, four-cycle, water-cooled motor having a bore of 4.75 inches and stroke of 5.5 inches, rated at 45 horsepower. A multiple disc clutch is employed, as well as a sliding gear transmission, back of which is a sub-transmission consisting of Morse silent link chain and gears. Inside of the driven gear is placed a differential, from which two shafts drive to bevel gear differentials on both axles, all four wheels being driving members.

On the shafts and near the sub-transmission is a patented locking device, one for each member, these being utilized in an emergency for operating an opposite pair of wheels in the event of serious damage to either shaft or axle. Both axles are of the full floating type, and the front member is fitted with the Four Wheel drive patent device, with ball and socket steering joint enclosed. The universal joint permits the machine to be driven and steered by the front axle.

PRESIDENT SPEARE ON REGISTRATION FEES.

IN RESPONSE to a special message sent to the Massachusetts legislature by Governor Foss, the subcommittee of the committee on roads and bridges in that body has prepared a bill, which will increase the registration fees for motor cars in that commonwealth very materially. The Massachusetts State Automobile Association has undertaken the matter of procuring a more favorable measure before final action is taken. President L. R. Speare of that organization has addressed an open letter to the various automobile clubs throughout the state, in which he sets forth the following:

The bill which has finally been reported by the roads and bridges committee to the Massachusetts legislature in regard to the increase in registration of automobiles and commercial vehicles contemplates the following for automobiles: Five to 19 horsepower, 30 cents a horsepower; 19 to 29, 40 cents; 29 to 39, 50 cents; 39 to 49, 75 cents; 50 and over, $1.

It will be evident to all automobilists that this is absolutely ridiculous. In Col. Sohier's letter accompanying the governor's message (House Bill 1784) he states that a fee of 50 cents a horsepower graded in multiples of 10 horsepower would have raised on last year's registrations $176,373 more than was raised. He also says the net amount available from all sources in the automobile department was $504,162, and this would have made a total net amount available for roads of $680,535.

Now then, the actual rate of 50 cents a horsepower, with a minimum of $5 as the lowest fee, would amount to a great deal more money. It can be fairly assumed that on this year's registrations it would amount to approximately $1,000,000. That is, under the suggested rate of 50 cents a horsepower, at actual horsepower, instead of being graded in multiples of 10, a 40 horsepower car would be the same as it is now, $20; a 48.6 horsepower car, if rated at 48 would be $24, if at 49, $24.50. Of course there is a large number of cars that would grade at 35 horsepower, which would figure out at $17.50, as against the present rate of $15. It is impossible for us to see any reason in grading any car at a different rate a horsepower, and there is no other state in the Union that has done this. It is absolutely unique. In consultation with the highway department officials they tell me that some low powered electrics would figure out under the graded rating at $1.80, where they are now paying $5, and, as a matter of fact, the net amount received by the state under this new bill, according to the highway commission would be less than that received last year under the existing fees.

The directors of the Massachusetts State Automobile Association consider this an absolutely impossible proposition, and it should never become a law. After consultation with representative motorists all over the state we found that there was a feeling that the higher priced cars should pay a little more than they have been charged, and therefore we suggested that if the present law were to be changed at all the fee be made 50 cents a horsepower, figured on the universal rating, with a minimum fee of $5 per car. This, it seems to me, would be much fairer than the present jump in multiples of 10 horsepower. Under this arrangement the larger cars would pay a great deal higher price than the small cars.

We really do not believe that horsepower designates the amount of damage done to the roads, but perhaps it is the fairest method that can be devised. Up to last year, in Connecticut, the rate of taxation was 50 cents a horsepower for all cars up to 25 horsepower, and 60 cents beyond. Realizing the unfairness of such a law, it was changed in 1911 and is now 50 cents a horsepower.

We believe that if the proposed bill should become a law it would work great injury to the automobile interests in this state.

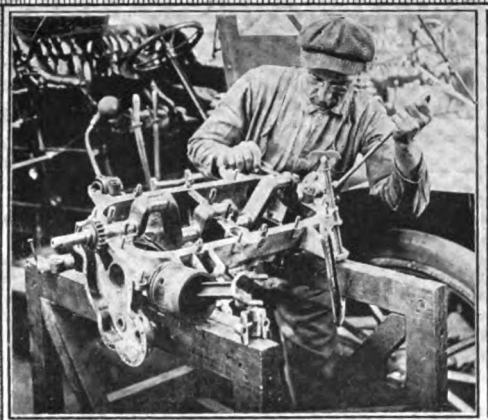
In regard to commercial motor vehicles, we are informed that the same scale is to apply to these. This is manifestly unfair. After a great deal of consultation with different manufacturers of motor trucks, we do not believe that horsepower is a fair scale to work on in regard to commercial motor vehicles. The proposition is different from that covering pleasure vehicles. For example, some five-ton trucks have 35 horsepower, some have 40, and some 48.6. Each is carrying the same load and at the same rate of speed. Manufacturers agree that 12 miles an hour is the speed that a truck should make, and it should not be driven at a higher rate. If the 48.6 horsepower truck were rated at 49, the fee would be $36.15, the 40 horsepower would pay $30, and the 35 horsepower would pay only $17.50, less than half the registration of the 48.6 truck, while doing equal damage to the road in every respect.

In other words, the 48.6 horsepower motor truck is obliged to pay more than twice as much as the 35 horsepower truck simply and purely because it has a larger engine. It goes no faster, carries no larger load, and does no more damage to the road.

We have suggested the following scale for motor trucks, which would make an enormous increase in the amount of registration, and it seems to us would be fair: One-ton, $5; two-ton, $7.50; three-ton, $10; four-ton, $12.50; five-ton, $15; six-ton, $17.50; seven-ton, $20; eight-ton, $22.50; nine-ton, $25; 10-ton, $27.50; over 10-ton, $50.

It is doubtful if a motor truck would be built that would carry over 10 tons, but if the manufacturers should conclude to put a jumbo on the road we believe that they should pay for it, as the roads are not fit to carry over a 10-ton load at the present time. The fee would be based on the tonnage guaranteed for the truck. He could not guarantee it to carry a small amount as he would not be able to sell the truck, and the tax would not be so large that that there would be any object in so doing.

Please take this matter up immediately with all members of your association, and create a vigorous opposition to the bill when it comes up in the legislature for action. The registration of pleasure vehicles should arouse the keenest interest among all members, and in fact, among all automobilists throughout the state, while the motor truck registration, being included in the bill, should be looked after with equal care.



GOODYEAR TIRE HAS BIRTHDAY.

It is maintained that two out of every three automobiles in service in the United States are equipped with tires made in Akron, O. The Goodyear Tire & Rubber Company, one of the best known of the Akron tire concerns, celebrates its 13th anniversary this month, and since its formation 1,000,000 of its automobile tires have been placed in the market.

The development of this concern is of interest. In 1907, it made only 28,685 tires, but that year marked a new era in the demand for its product and the output has been doubled each year, until in 1911, 409,521 pneumatics were manufactured. The present year marks another epoch in its history, and although 1,000,000 shoes have been produced by it, Factory Manager B. W. Litchfield says it will be necessary to turn out 1,000,000 tires during 1912, in order to meet the increased demand.

Form Corning Club—Fifty motor car owners in Corning, N. Y., met recently to organize the Corning Automobile Club, and were addressed by A. J. Deer, president of the state association, and Charles L. Bowers, county supervisor of highways. The officers of the club follow. President, H. H. Kendall; vice president, R. E. Gregory; secretary, Winfield P. Sleight:

MECHANICAL NOTES FOR OWNERS

Methods of Simplifying the Care and Maintenance of the Car, Discussion of Pertinent Facts and Notes on Operation.

FITTING FENDER BRACES.

Vibration has a deteriorating effect upon sheet metal if the material be not fastened securely, such as with fenders of the motor car. At Fig. 1 is illustrated a device fitted by a motorist to prevent the fenders from vibrating. It consists of two braces, one on either side, made of .3125-inch round rods. These

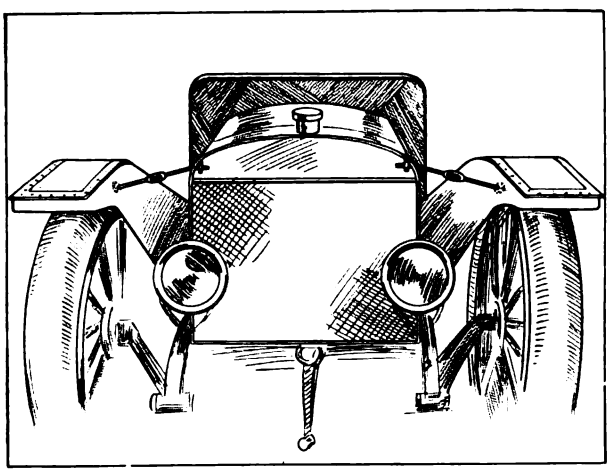

Fig. 1—Easily Constructed and Fitted Device for Bracing and Preventing Fenders from Rattling.

were made in two pieces and threaded at both ends. A turnbuckle was utilized to connect the sections and for adjustment. One end of the rod was passed through the fender and secured by a locking nut while the other extremity was similarly attached to the radiator.

FITTING WITH SPARK PLUGS.

The average motorist who purchases new spark plugs to replace old or faulty members does not take into consideration the fact that to obtain the greatest efficiency from the motor the plugs should fit properly. Usually if the plug be gas tight and ignites the mixture the automobilist is satisfied. The construction and location of these members are of vital importance and engineers and designers have given a considerable amount of study to the subject.

It is well known that spark plugs are subjected to great changes in temperature and consequently those of expansion and contraction. The distance of the so-called spark gap must be maintained in accordance with the engine requirements and with the current with which it is used.

With the introduction of the high-tension magneto it was found necessary to design a plug to meet the peculiar requirements of this current. Ordinary spark plugs when utilized with a high-tension magneto gave trouble, owing to the intensity of the current burning the points and increasing the gap, and heat resisting materials are employed in the construction of the electrodes.

With the magneto plug two or more electrodes are fitted, each having approximately the same sized gap. The current will invariably pass across the gap presenting the least resistance and should its electrode burn away slightly it would offer greater resistance so that the current would seek one of the other gaps.

Location Is Important.

The best and most scientifically designed plug will not give satisfactory results if its location in the cylinder be incorrect. In order to obtain the greatest efficiency from the motor the time required for the spread of the flame through the charge of mixture should be as brief as possible, and to secure this end the spark plug gap should be located in the combustion space, and not in a pocket or recess. If the latter conditions exist, such as shown at Fig. 2 A, dead gas will accumulate about the electrodes, causing slow combustion and missing.

The action of the motor may be improved considerably by boring out the valve cap, allowing the plug to set down so that the points of the member will project into the combustion chamber as depicted at B. The spark will then come in direct contact with the clean and fresh mixture and the flame will spread with maximum rapidity. The plug should preferably be located in the immediate neighborhood of the in-

Digitized by Google

take valve and in such manner that it will be surrounded by the fresh gas that enters on the inlet stroke. If the plug be located on the exhaust side there is a liability that dead gas will collect around its points causing faulty action.

Obtaining Best Results.

In order to obtain the best results the plugs should be so set in the cylinder that cooled metal is in proximity to the sparking points, as in this manner possible overheating of the points will be eliminated. A plug that is not cooled properly will overheat and the points will become incandescent, creating trouble. The plug should not extend too far into the combustion chamber as in this position it would be subject to undue heating.

If, on the contrary, the desired length of the plug is made up by extending the barrel, or that portion above the thread, the metal of the electrodes will be adjacent to the cooled metal of the engine and the heat will be transferred readily. On some motors the plug is set in the cylinder wall in such manner that

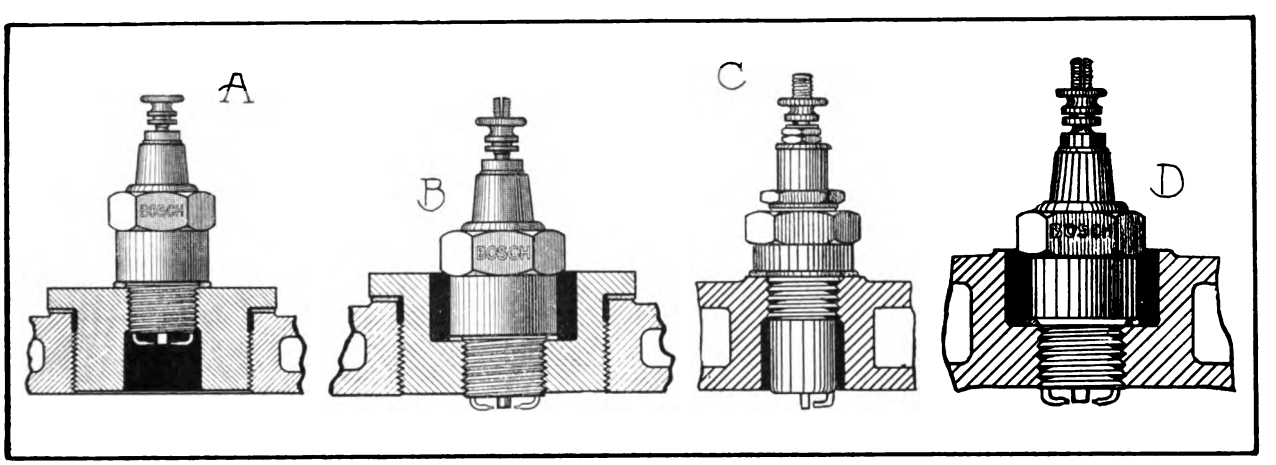

Fig. 2—Outlining Positions of Spark Plug in Cylinder: A, Poor Location, Creating Pocket for Dead Gas; B, Proper Position, with Points Extending into Combustion Chamber; C, Faulty Design, Exposed to Heat; D, Showing How Same Valve Cap May Be Bored to Obtain Correct Location of Plug.

it must project through the water jacket, and extension plugs are required in order to prevent the pocketing of gas.

At C is depicted a plug so located that a pocket is provided. Considerably better results will be obtained on engines of this type if the spark plug hole be made large enough to permit the thread to be cut at its very bottom, as shown at D, for in this manner the plug will be cooled properly.

IMPROVING ACETYLENE LAMPS.

Owing to the spaces provided to carry off the heat in gas lamps more or less dust and dirt finds its way into the members and after long service the black paint becomes shiny, especially if it be cleaned frequently with a stiff cloth. This paint is utilized to absorb certain rays of light and may be renewed easily by using a dead black.

CASTOR OIL AS A LUBRICANT.

There is considerable controversy in progress in England over the efficiency of castor oil as a lubricant for the internal combustion engine, some claiming that in road and track contests it improved the motor action, as well as lubricated its working parts much better than the usual oil. In view of the argument the report of an authority who conducted elaborate tests with castor oil appearing in the Autocar recently will prove of interest.

A series of tests were made on systematically varied oils, each being for 1000 miles under definite conditions. The report concerning the use of castor oil, after the engine had been disassembled, was as follows: "After this test all four pistons looked very much alike; each one had a thick, hard, shiny and fairly smooth deposit on top, and very little on the sides. All rings were quite free, and well lubricated. The cylinder heads had a thin, hard deposit all over, and the valve caps had more deposit than with any other oil. The valve pockets also contained an exceptional amount of carbon."

This report gives the impression that castor oil leaves perhaps rather an exceptional carbon deposit as compared with other oils and this is emphasized by the actual weights of the deposit, which are given below. The cylinders were very carefully withdrawn, and a special slotted tray fitted around each connecting rod under each piston in turn. The whole of the deposit was carefully scraped into the tray and removed with a camel's hair brush into a receptacle to be weighed. The deposit from each piston was weighed separately, but the total weight on the four pistons is given for the castor oil C, which was the finest quality obtainable; for pure mineral oils A, B and F, prepared from the highest class crude, but differing in viscosity, and for mineral oils H and G, prepared from inferior crudes. The relative viscosities at 140 degrees Fahrenheit, are placed against each in the table on the following page:

Digitized by Google

Table of Comparative Results.

	Viscosity	Weight of Deposit Grams*
A—Pure mineral oil	1.0	5.12
B—Pure mineral oil	1.5	6.57
F—Pure mineral oil	2.3	9.54
H—Inferior mineral oil	1.1	8.82
G—Inferior mineral oil	2.2	13.55
C—Castor oil	4.4	14.08

*Metric system—One gram equals 15.438 grains, Troy.

From this it will be seen that the carbon deposit is greater with castor oil than with even a low grade, heavy bodied mineral oil as G. In the opinion of the expert, castor oil can only be used with impunity in fixed cylinders, for short distances, and with repeated cleanings between runs, although on rotary motors of the Gnome type cleaning is almost unnecessary. The

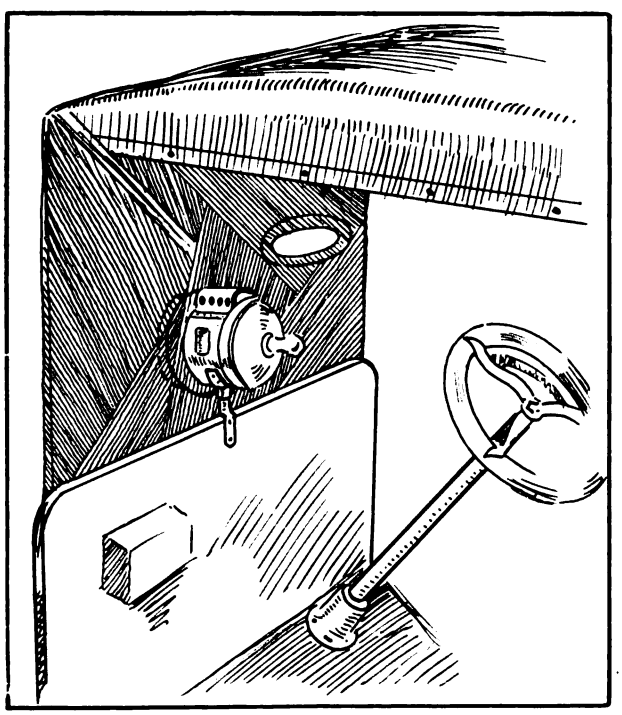

Fig. 3—Depicting How a Dash Searchlight May Be Utilised with a Storm Curtain.

reason is that one cannot consistently use castor oil over and over again, for the fact is indisputable that it has a far greater tendency than mineral oils to absorb oxygen, and so gradually to increase in body, and finally to gum. When it once commences to gum, the carbonization becomes more rapid, because the thickened and pitch-like oil acts as an insulating covering on the top of the pistons and of the cylinder, and cannot get away with sufficient rapidity to avoid decomposition and baking to a coke.

If castor oil is to be utilized on the ordinary stationary cylinder type of engine, it is necessary to wash out the crank chamber and to replace with fresh oil at frequent intervals. On a rotary engine such as the Gnome this cleaning is unnecessary, because there is a continuous stream of fresh castor oil brought into the crank chambers and then thrown by centrifugal force past the pistons and through the cylinder into the exhaust. Thus the stream of oil never has sufficient time to oxidize fully, gum or decompose.

This action of centrifugal force accounts for the large consumption of oil on rotary engines, and also for the fact that the pistons and cylinders keep comparatively clean. It is noticeable in this connection that the castor oil from the exhaust of a rotary engine is pale yellow in color, and shows practically no change from its original condition, whereas castor oil which has been run some few hundred miles in the crank chamber of an ordinary non-rotary type motor is almost black, and considerably more viscous than new oil. It will also be found to have undergone considerable chemical change; its specific gravity will have increased, and iodine value decreased. This combination indicates that oxidization or gumming has occurred.

Viscosity of Castor Oil.

In criticising the use of castor oil the authority states that he does not wish it to be inferred that it is not an excellent lubricant, but suggests that in the case of an internal combustion engine it must be used with discretion. A point in favor of castor oil is the fact that it maintains its viscosity in a remarkable manner under high temperatures, and at these it has a peculiar creeping or capillary action which enables it to spread uniformly over the whole of the metallic surfaces, whereas under the same conditions a similarly bodied mineral oil would be unevenly distributed in patches. Another point is that the specific heat of castor oil is considerably higher than that of a pure mineral oil. This is in its favor, insomuch that it shows castor oil to be a better heat remover than a mineral oil.

"Motorists and aviators have from time to time informed me that they have been using castor oil, but have apparently been under a misapprehension," says this authority. "I find that they have been using a brand of prepared oil under the impression that it is a specially refined castor oil, or that it is a blend of castor oil with a pure hydrocarbon oil in which blend the office of the latter is supposed by them to be one of protecting the particles of castor oil from oxidation. This ingenious idea, however, would not appeal to a chemist or physicist.

"Some time ago, being myself under the impression that this particular brand of oil, on account of its name, had some kind of relationship to castor oil, I purchased samples A, B and C, from ordinary sources and analyzed them. I found one and all to be simply ordinary refined mineral oils, free from any trace of castor oil. Below I give some of the tests of these brands, as compared with cold drawn castor oil at D:"

It will be noted that the viscosity of castor oil at 140 degrees Fahrenheit was nearly 50 per cent. in excess of that of the other samples and even at 200 degrees it was higher.

The low figure for the flash point, open test, occasioned three similar tests and these showed the same result. The above viscosities were taken on the standard Boverton Redwood instrument, and the figures denote the time occupied for 50 cubic centimeters to flow from the instrument at the temperatures stated.

Saponifiable and Iodine Value.

By the term saponifiable is meant the property of essentially separating mineral oils from fatty, or from oils of animal and vegetable origin. An oil to resist saponification must resist the action of an alkali such as soda or potash. Fatty oils do not resist such action, but are split up, yielding glycerine and a soap. Mineral oils, on the other hand, might for all practical purposes be called unsaponifiable, and are generally only affected by the action of alkalies to the extent of one per cent. or less.

The iodine value of an oil may generally be taken as an indication of the extent of its "unsaturation," or perhaps one might say more simply that it is an indication of the amount of oxygen which that oil is capable of absorbing. It may be taken as a universal rule to which there is but one exception (which is not castor oil) that commercial fatty oils have iodine values between 25 and 205, while mineral oils vary from four to 21, according to their state of purity and origin. The purer and more highly refined a mineral oil is the less will be its iodine value.

"In conclusion," says the expert, "I would call attention to the essential difference which exists between mineral oils and castor oil in the chemical tests; that is, saponification and iodine values as distinct from physical tests, for although it is possible to manufacture mineral oils having the same viscosity and specific gravity as castor oil at given temperatures, yet it is quite impossible to imitate in them saponification and iodine values."

A SEARCHLIGHT SUGGESTION.

Searchlights of the dash type are favored by some motorists as these lamps may be adjusted instantly and without the operator leaving the seat. They are at a disadvantage, however, when the use of the storm curtain is desired. At Fig. 3 is presented a method adopted by an automobilist who drives considerably at night, and who also uses the storm curtain for protection against the wind.

A hole slightly larger than the diameter of the lamp was cut in the celluloid and the edges of the latter bound with leather. The front of the light projected through the opening, which was large enough to allow the lamp to be moved as desired. At the right of this was cut another opening for use during stormy weather.

MISS KNIGHT IN NEW YORK.

Miss Margaret Knight of South Framingham, Mass, inventor of the Knight-Davidson silent type motor, which was exhibited for the first time during the recent Boston show, has been in New York City during the past week. It is understood that her visit was for the purpose of meeting a firm of automobile manufacturers which was interested in securing the right to produce this engine in its cars, although the name has not been made public.

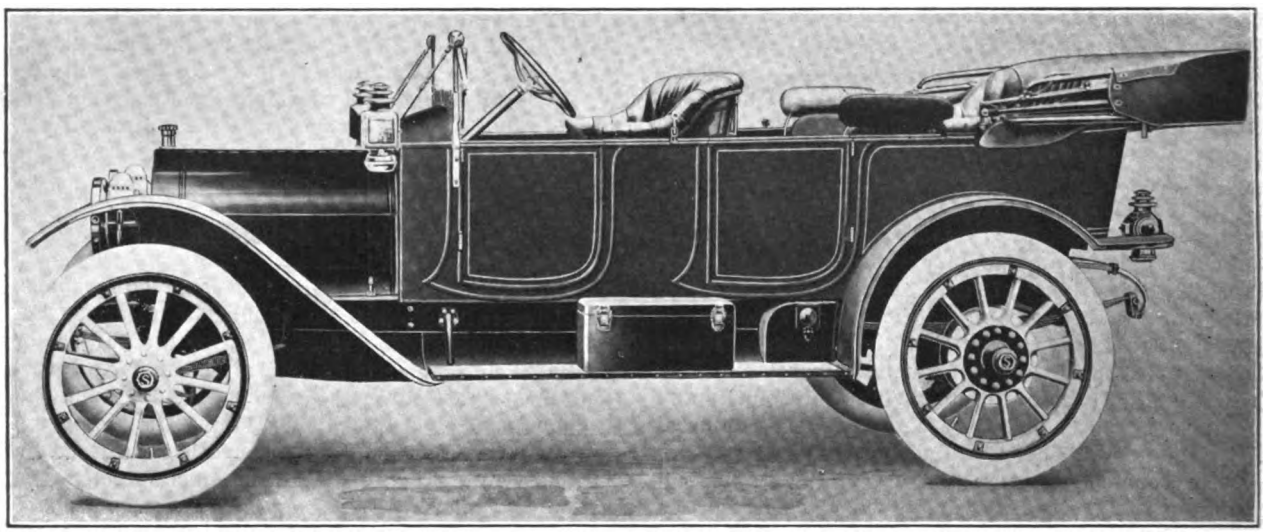
ROCHESTER CLUB HOLDS ELECTION.

Nearly 600 of the 1537 members of the Automobile Club of Rochester, N. Y., attended the annual meeting of the organization in the Hotel Seneca, March 25. The election of officers resulted as follows: President, Charles J. Brown; first vice president, W. W. Hibbard; second vice president, W. W. Dake; secretary and treasurer, Bert Van Tuyle; directors, R. M. Searle, George Dietrich, C. F. Wray and William Bausch.

BIG SALE OF HUPMOBILES.

The Pillsbury Flour Mills Company, Minneapolis, Minn., recently decided to supply its salesmen all over the country with automobiles, for the purpose of making their regular trips, and after extensive investigation of the cars on the market, decided upon the Hupmobile, made by the Hupp Motor Car Company, Detroit. Seventy-five machines have been ordered by this concern, and deliveries will be made direct to the various headquarters of the big milling corporation.

The first car was placed in service some little time ago, and an accurate account of its work was kept by the Pillsbury company. As a result, it was found that the salesman could cover three towns in the time formerly consumed in visiting one by train, and without any increase in expense.



E-M-F BREAKS MAINE ROADS.

James G. Tibbetts of the Bath Automobile & Gas Engine Company, Bath, Me., holds the honor of taking the first motor car through from that city to Boston this year. The machine was a 30 horsepower E-M-F, made by the Studebaker Corporation, in its E-M-F factories at Detroit, and it was forced to negotiate snow drifts three feet deep, washouts and mud. Several times it was necessary to take to the fields. The start was made from Bath at 2 in the afternoon and Portland was reached that night, although it had rained all day. The trip was resumed from Portland at 3 in the morning and the arrival in Boston was at 5 in the afternoon.

1912 SELDEN CHASSIS AND BODY TYPES.

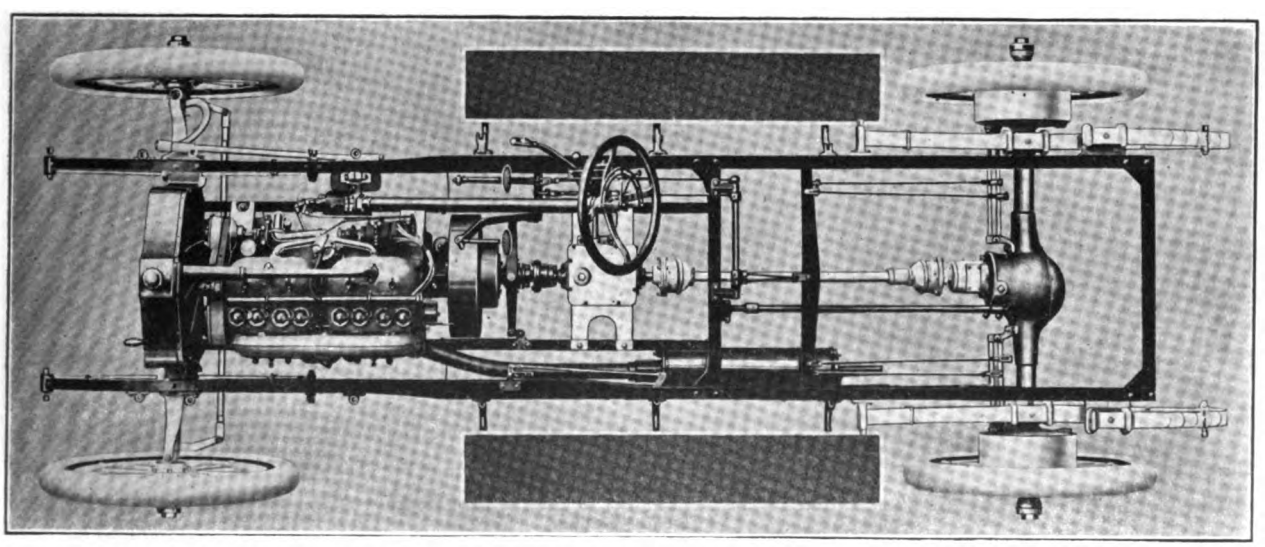
CONFORMING to its policy to produce but one chassis, and to develop this to the greatest degree possible, the Selden Motor Vehicle Company, Rochester, N. Y., has but one type of machine, which is equipped with five styles of body, these being a two-passenger roadster, a four-passenger torpedo touring car, a five-passenger touring car, a seven-passenger touring car and a seven-passenger limousine. The chassis follows the same general lines of earlier productions, but several changes have been made that are regarded as mechanical improvement, insuring greater efficiency and a larger measure of satisfaction. Among the changes that are noticeable may be instanced the use of a multiple disc clutch of dry plates and a full floating rear axle, both of which have been adopted after careful experiment and continued observance.

Selden 1912 Model 47 S, a Seven-Passenger Touring Car Body Installed Upon a Standard Chassis.

The development of the chassis has been with the purpose of standardization and the refinements have been determined with the knowledge that there has been nearer approach to the ideal. Selden cars have been held to be unusually noiseless and smooth in operation and these qualities have been maintained, the new form of clutch affording a degree of flexibility that is especially desirable. The rear axle was decided on with a view of securing increased strength and endurance and an accessibility that will economize work for examination or repair.

The Selden motor has four cylinders that are cast in pairs from a fine grade of gray iron. They are of the T type with the valve pockets at the left side. The bore is 4.75 inches and the stroke five inches. The engine is rated at 36.1 by the S. A. E. formula, and by actual brake test it will develop 48, but 40 horsepower is conservatively claimed by the maker. The cylinders are cast with water jackets integral, the water spaces being ample in size, and the units have large openings at the head by which the core is thoroughly cleaned, this insuring against obstruction of the water circulation. Baffle plates in the water jackets direct the water against the exhaust valve pocket walls before the top of the cylinders is reached, this making for certain and effective cooling of the valves. These holes in the cylinder units are closed with large plates and are fitted with gaskets to make a perfect water tight union.

The pistons are of the same material as the cylinders. The cylinders are bored, aged and ground to accurate size, and the pistons are turned and ground to fit. The piston rings are ground and fitted with equal care. The engine base is an aluminum casting, in two sections, the upper portion having four arms cast integral which serve as supports for the power plant in the sub-frame. The main section carries the main bearings, the camshaft bearings, the water pump housing, the timing gears and the cylinders. The lower part of the case contains the oil reservoir, the compartments containing the lubricant, and the mount for the oil pump. This is bolted to the upper section and it may be removed without disturbing the engine bearing for work on the crankshaft, camshaft, connecting rods and the bearings.



The crankshaft is large in diameter, is drop forged from nickel steel, and is heat treated to increase its strength. It is carefully ground to size. The main bearings are of a high grade of die cast bearing metal and have extreme endurance. The camshaft is of liberal proportions and is ground and hardened. Cams are made separately and after hardening and grinding they are keyed to the shaft, this insuring a more uniform tempering of the cams, while in the event of wear the cams may be replaced without sacrificing the shaft. The bearings are of die cast metal and are of large

Digitized by Google

size. The connecting rods are steel drop forgings and are I section. The wristpins are steel, carefully hardened and ground to size. The crankpin and wristpin bearings are generous and of die cast metal.

The valves are of steel with nickel steel stems, the heads being 2.25 inches diameter, electrically welded. The interchangeability of the valves is a desirable quality. The pushrods are a mushroom type, operating directly between the cams and the valves. The rods revolve in the guides to minimize wear and noise and, being very light, insure a quick valve action. These rods may be adjusted to compensate for the wear of the valve stems by adjusting screws and nuts. The design is such that the pushrods and the guides may be removed without disturbing either the valves or the cylinders. The valves lift .3125 inch, insuring thorough exhaust of the products of combustion from the cylinders and the inspiration of complete charges of fuel, no matter what the speed of the motor. The valve stems, springs, pushrods and guides are hose that has unusually long life. A draft of air is forced through the radiator by a fan mounted on a bracket in front of the forward cylinder, the fan shaft revolving on an annular ball bearing that is automatically kept at exact tension by a spring. The fan is driven by a flat endless belt off a pulley mounted on an extension of the water pump shaft. The belt may be replaced when this is desirable by the removal of a coupling in the shaft without taking down any other parts of the engine.

The engine is lubricated by a combination mechanical feed and splash system that is in every way efficient. The oil reservoir, having a capacity of six quarts, is cast integral with the lower section of the engine case, and a float gauge indicates the quantity of lubricant available. The float is of the metal type and it operates a steel ball, the position of which may be felt if necessary, so that the oil supply may be replenished by dim light or at night without need of bringing a light near the motor. A gear-driven paddle pump on

Top View of the Selden Standard Chassis for 1912, as Ready for the Body Installation.

thoroughly protected from abrasive substances by the use of aluminum plates that are fitted to cover the web extensions of the cylinders that enclose these moving parts.

The timing gears are made with wide faces and are a spiral type to insure noiseless operation. The camshaft gear is bolted to a flange made integral with the shaft, there being two series of bolt holes, these being spaced differently with relation to the gear teeth, so that an adjustment of a half tooth may be made in the timing. The timing may be very closely adjusted because of this provision. But six gears are used in the motor and they are all spiral cut.

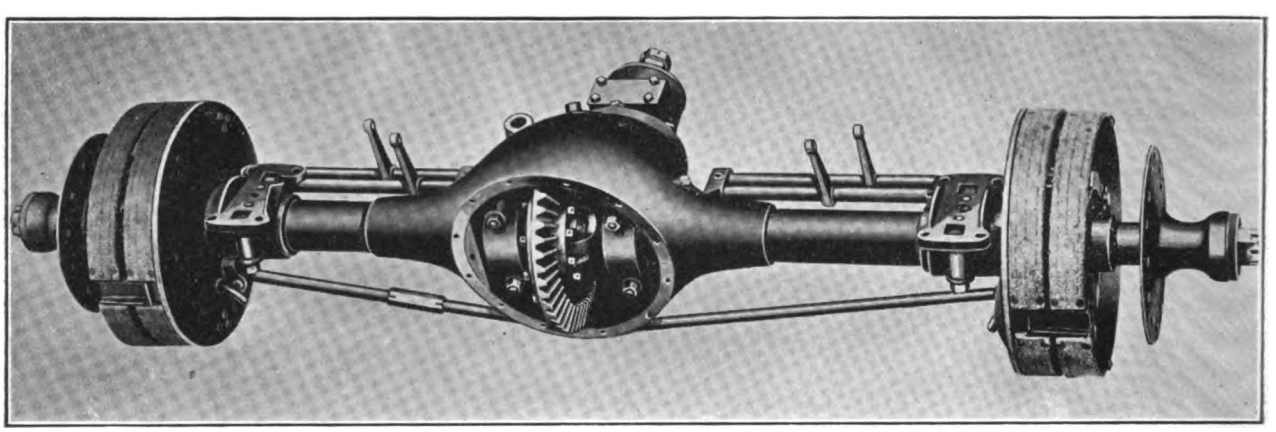
The motor is cooled by water circulated through a pump of large capacity of the centrifugal type located at the right side of the motor. The water is cooled by a radiator of the square tube design that is carried in a brass housing, connections with the motor being of seamless brass tube and specially vulcanized rubber

the lower end of the time shaft is installed in a well in the reservoir and after filtration through a screen the oil is pumped into the four compartments beneath the crank throws, maintaining a constant level in them, so that there should always be the same quantity of lubricant into which the connecting rods will sweep at each revolution of the crankshaft. A special lead from the pump also supplies the timing gears with ample lubrication. A level cock permits an excess of oil to flow from the case and drain cocks afford complete drainage whenever it is desirable to flush out the case and the oil reservoir.

The fuel is carried in a tank of 17 gallons capacity installed under the driver's seat, and it is supplied by gravity feed to a carburetor of the automatic float feed type that is designed to create a uniform mixture at all times. The carburetor is water jacketed and the fuel is completely atomized and raised to a temperature that insures full vaporization before reaching

Digitized by Google

the combustion chamber of the engine cylinders.



The ignition system, after four years' experience, has not been changed. It is primarily a Bosch magneto, type DR4, that is mounted on a bracket at the side of the motor and is driven by an extension of the water pump shaft. The magneto is strapped to the bracket by metal straps which are retained by a single thumb nut, so that the instrument may be instantly removed without the use of tools. The magneto drive shaft is fitted with an adjustable coupling so that by loosening one bolt the magneto armature may be set to any desired relation with the crankshaft. The wiring system from the magneto is connected with one set of spark plugs. The reserve or starting ignition system consists of a battery of six dry cells carried in a box on the running board, a four-unit spark coil and a master vibrator and timer, the leads of wire from the timer being connected with a second set of spark plugs. The master vibrator insures the creation of a uniform spark in each cylinder from each coil. Cut-out buttons on the coils permit the testing of the coils as desired and each coil unit may be removed from the coil case, which is hinged to afford accessibility. The timer is a roller type and it is mounted on a vertical shaft installed between the cylinder units, where it is always accessible.

The clutch is a dry plate multiple disc type contained in a housing that is bolted to the flywheel. The simplicity and effectiveness of the clutch are two of the factors that dictated its adoption for this car. The clutch assembly consists of 13 discs, seven of which are fixed to the housing attached to the flywheel and revolve with the crankshaft. These driving discs are faced with an asbestos composition, riveted on. The six driven discs, keyed to the clutch shaft, are not faced. The driven discs are contacted with the driving discs by the pressure of two heavy helical springs, the tension being adjustable by a pressure plate that is retained by three studs extending through it, these studs being prevented from loosening by an automatic spring lock.

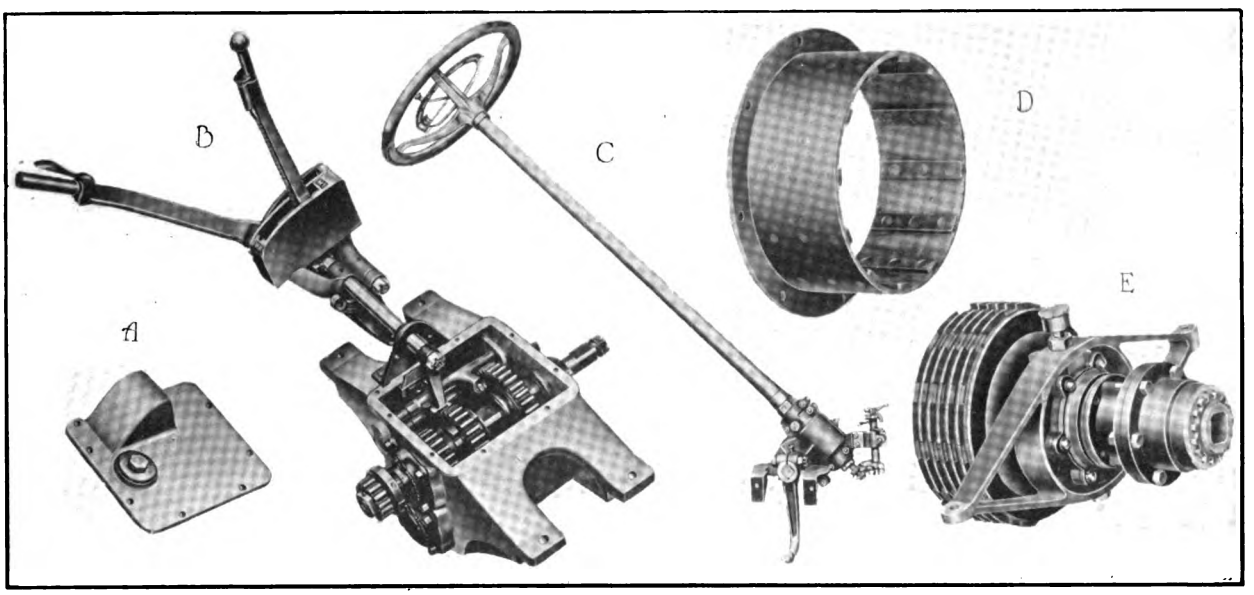
A universal joint of the gear type, consisting of a pinion on the transmission driving shaft inserted in an internal gear of equal size on the clutch shaft couples the clutch and transmission shafts, permitting sufficient longitudinal movement without lost motion. The thrust of declutching is taken directly upon the transmission bearings. An adjustable clutch brake is mounted on drive shaft and this prevents spinning of the clutch when disengaged and permits speed changes to be made with ease. The clutch pedal is connected through a system of linkage with a large ball thrust bearing on the clutch shaft so that the clutch may be disengaged with very light pressure. The clutch is interlocked with the emergency brake so that when the brake is set the clutch is automatically disengaged. This interlock may be disconnected with ease should there be desire. The entire clutch assembly may be removed from the chassis for examination or adjustment by the removal of a few bolts. It is unusually durable and is exceedingly simple in construction.

There is practically no change in the transmission, which is a selective type, three forward speeds and reverse. The shafts are mounted on Timken roller bearings that are adjustable from the outside of the transmission case without removing the case or disturbing any other parts. The case is an aluminum casting that is attached to the top of the sub-frame by four supporting arms and a large cover plate permits inspection to be quickly made when desired. The driving shaft is of special steel and it is fitted with two Spicer universal joints.

The rear axle is a full floating type with the pinion shaft mounted on New Departure ball bearings. The differential assembly is carried on Hyatt high duty roller bearings with ball thrust bearings and the wheels are fitted with New Departure ball bearings of large capacity. The axle driving shafts are fitted with flanges at the outer ends to which the wheels are bolted, this relieving the hub caps of the strain of driving and eliminating possibility of lost motion. To prevent leakage of oil into the brake drums sleeves are carried on the hubs that conduct any lubricant that may pass along the axle shafts into annular re-

Rear Axle of the Standard Selden 1912 Chassis, Showing the Differential Gears and the Large Internal Expanding Brake Shoes.

Digitized by Google



cesses in the brake flanges, from which it is drained into the highway. The differential assembly may be removed from the axle by taking off the cover plate of the pressed steel housing. The front axle is a drop forged steel I section.

The torsion rod is a heavy steel tube with drop forged steel ends. The rear end is attached to the rear axle by two short vertical steel pins, this making a far more substantial connection that one long pin. The forward end of the tube is installed within a housing that encloses a heavy helical spring that takes the road shocks, the housing being attached to the chassis frame cross member by a heavy bracket. The housing is packed with grease and it excludes dust, mud and water.

The chassis frame is a pressed steel channel 4.75 inches wide and .1875 inch thick, having three cross members and a sub-frame supporting the motor and transmission. The frame is cambered at the front and raised at the rear to allow the use of three-quarter elliptic springs. The forward springs are semi-elliptic, 32 inches length and two inches width; the rear springs are 51 inches length and 2.25 inches width. The wheels are artillery type, 36 inches diameter, fitted with quick detachable and demountable rims. The forward wheel bearings are of the cup and cone type and are adjustable. The wheelbase is 125 inches, the tread 56 inches and the road clearance 10 inches.

The steering gear is a worm and sector, a full circular sector giving four distinct wearing surfaces, any of which may be used, affording long life to all wearing parts. The gear housing is bolted to both the sub-frame and the chassis frame, this being an unusually rigid construction. The steering wheel is 18 inches diameter with a cast aluminum spider and wood rim. The ignition and throttle levers are mounted on a stationary quadrant in the centre of the steering wheel and are held by spring catches.

The control is by clutch and service brake pedals, a foot accelerator, a muffler cut-out, and hand levers for the changes of speed and the emergency brake. The brakes are internal expanding, the shoes being 1.75 inches wide, operating within drums 14 inches diameter, on the rear wheels. The speed control is by a single shaft entering the top of the transmission case, the control mechanism being supported by a large bracket attached to the chassis frame and the sub-frame. The muffler is the same size as previously used, but the cut-out valve is larger and the operating mechanism has been redesigned. The lamp brackets are heavy drop forgings set into sockets riveted to the chassis frame and connected by a tie-bar. The side lamp brackets are attached to the dash and carry the front ends of the windshield stay rods. The running boards have been lengthened and they are now carried on three hangers, giving a more rigid construction. The head lamps are acetylene gas burning, but the dash and tail lamps are electric, the current being supplied by an 80 ampere-hour storage battery carried in a box on a running board.

Selden Construction Features: A, Cover of the Transmission Case; B, Transmission Assembly and Speed and Brake Levers; C, Steering Gear; D, Clutch External Member; E, Clutch Plate Assembly.

WEST WANTS GOOD ROADS.

That there is a determined movement on foot for better highways in Missouri, Kansas, Illinois and Nebraska is the report made by Charles P. Light, field secretary of the American Association for Highway Improvement, after a trip through the Middle West. He says he mingled with all sorts of people and found them convinced that road movement was the most important campaign ever undertaken.

10,000 Michigan Agents Are Back Of This Advertisement

They Are The Living Credentials We Offer In Support of Every Statement We Make.

Thirty years ago we started to manufacture carriages. We commenced with a small factory and no agents.

Today we have increased our factory facilities a hundredfold and we have built up the most efficient vehicle selling organization in the whole world—ten thousand live, active agents to sell our products.

These agents know us and our work. They have confidence in everything we say. They are READY to handle any product of the Michigan factories—and put their individual reputation behind everything we produce.

This enables us to manufacture our goods without selling cost. And thus saves this expense to the man who buys the goods.

THE BIRTH OF THE "MICHIGAN"

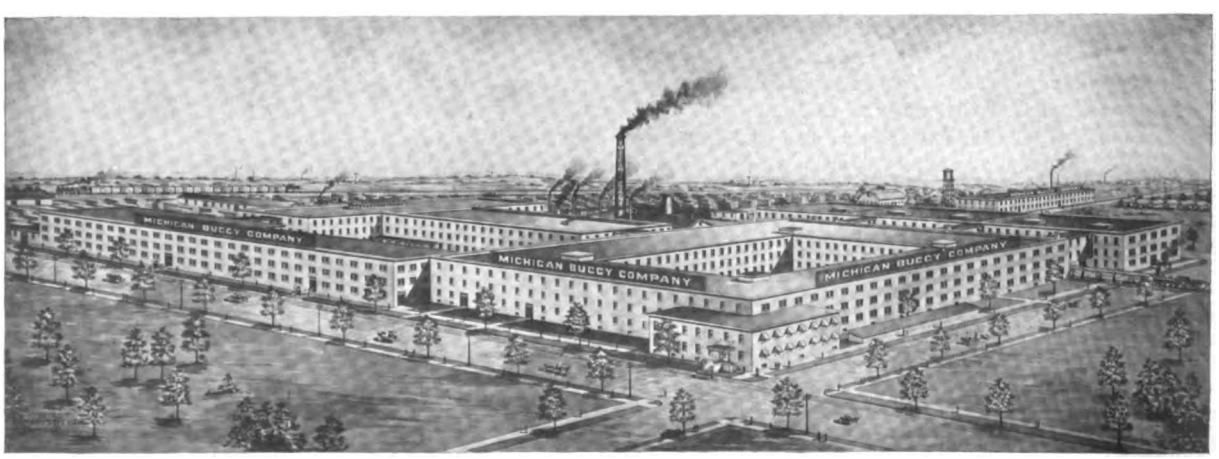
In 1909 we started to build automobiles. A simple announcement to our agents disposed of all the cars we could build. No expense.

And thus it has been ever since. Our agents have absorbed our entire product. Thus for representation which has cost other manufacturers fortunes, we have paid not one cent. And that is why we undersell.

THE FACTORY BEHIND THE CAR

Note the picture of the Michigan factories. They are a monument to our dealers. For all our success has come through our dealers—and their efforts in selling. We take to ourselves the credit of choosing these capable men and of being able to build with their help.

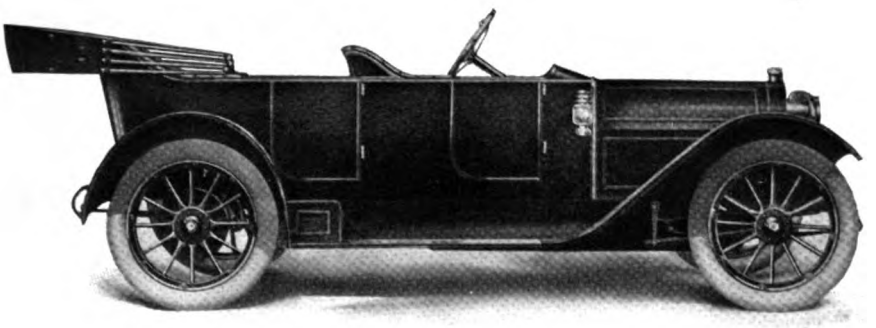
OUR COMPLETE LINE



We call attention particularly to our Models K and H here shown.

Each is a masterpiece of its type. Each has met with the unusual favor of motorists and automobile experts.

We cannot in an advertisement do justice to our cars. We can merely note some of the many points. To realize the big values in our machines you must see them for yourself. Or get a catalogue, which describes everything in detail.



A STRONG GUARANTEE

The Michigan Buggy Company backs up every car it turns out—with the broadest, most liberal guarantee that it is possible to place on a motor car. We do not guarantee the car for one, two or even six months. We simply say that if at any time the car proves defective, we'll make it right. And this guarantee means something backed up by an old line concern of thirty years standing.

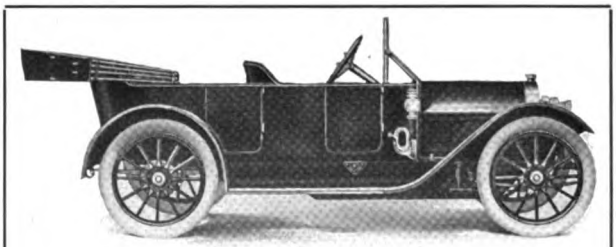
Big Features of Every Michigan Car

MIGHTY MICHIGAN "40," $1,500.

40 H. P. motor 4 1-4x5 1-4", three bearing crankshaft. 34x4 inch tires. Demountable rims. Nickel mountings. 116 inch wheel base.

SELF-STARTER



We have tried out nearly every self-starter made. The one self-starter that our engineers found to be entirely practical we have approved for use on MICHIGAN cars. It is simple and easy to operate, nothing complicated. Very light and thoroughly dependable. We gave it thousands of tests under all sorts of conditions, and it proved itself absolutely efficient. Nobody likes to crank a car. What folks will insist upon in six months you get NOW on the "Michigan Forty."

MOTOR

Absolutely noiseless in operation. Dust proof. Every moving part (except fan) enclosed. Long stroke, insuring greatest pulling power at low speeds, and utmost economy of fuel.

IGNITION

Tests of all kinds were made before we finally decided on the Briggs magneto. Not only did we find the Briggs the most efficient but we felt that its strong guarantee gave MICHIGAN agents another big selling recommendation possessed by no other cars of equal price.

MICHIGAN, MODEL H, $1400.

The MICHIGAN "33"—Model H—at $1,400 affords everything that the average family wants in a motor car save the surplus power and the extra room which comes with our Model K, the "Mighty Michigan Forty". It is completely equipped with self-starter,—the best grade Mohair top that we can build together with side curtains and dust cover.—Zigzag Windshield. In fact, everything needed to jump in and drive away. Best materials are used throughout and the same materials go into the machine that we put into our MICHIGAN "40."

WHEELS AND TIRES

We use genuine Shortsville A-grade wheels. Known everywhere for their strength. 1⅛ inch spokes. 12 to the wheel. MICHIGAN cars are overtired also—just to make sure that owners will not be bothered with that big bugbear of Motordom, tire trouble.

BRAKES

One square inch of braking surface for every eight pounds. Brake drums 14 inches in diameter, 2 inches wide. They are lined with raybestos, making it impossible to burn them out.

FRAME

Extra strong, 5-32 inch steel. Four inches deep, 3½ inch flange. Its extreme strength makes impossible accidents due to weak frame construction, and does away entirely with body squeaks.

BODY

Here's where we have made big capital of our vast carriage building experience. Big and massive, yet graceful and wonderfully suggestive of character and power.

COMFORT

Easy riding qualities secured by long wheel base, soft springs and luxuriously comfortable cushions. Appointments are perfect—such as you would expect to find only in cars costing $4000.

CLUTCH

MICHIGAN cars are equipped with clutch of Multiple Disc type. Can't grab—nor slip. A clutch that transmits a greater percentage of power to the rear axle than any other clutch on the market—bar none.

AXLES

Our three-quarter floating rear axle combines all the advantages of both the full-floating and semi-floating types, with none of the disadvantages of either. Hyatt High Duty roller bearings are used throughout.

The much advertised Tour de France, under the auspices of L'Auto of Paris, appears to have been decidedly uninteresting from the standpoint of a contest. The French motoring magazines characterize it as "too easy," and those in England as "of little interest or value as a crucial test." From a selling point of view it may develop that the event was of exceptional value, inasmuch as five days were allowed during the tour for demonstration of cars in the various cities where stop-overs were arranged.

Between Grenoble and Nice in the mountainous country, the Ford entrants changed their rear wheels for others of smaller diameter, in order to gain advantage of the lower gears. It is claimed by Henry Dupasse, the Ford agent in Paris, that the rules did not cover this point, but the three cars of this make were at once disqualified by the committee. They were permitted to continue the tour as non-contestants, however.

King George V and His Six-Cylinder Standard Car During Visit to Nepal, India.

In this connection it is interesting to note that the three cars comprising the Benz team were accompanied by a 40 horsepower touring car supplied with a full equipment of tools, spare parts and tires. Dupasse claimed that this was as much a violation of the rules as the Ford change in wheels, though neither point appears to have been forecasted in the regulations.

The tour came to an end in Paris, March 20, and 37 of the 52 entrants finished without penalization. While the three Fords and one Reo, representing America, finished with others, the Fords had been disqualified as explained above, and the Reo failed to reach one of the controls on time, due to a bad skid on a railroad crossing. The two-seated Hupmobile dropped out after covering about half the distance.

★

One of the results of the recent Durbar at Delhi, India, was the stimulation of interest in the use of automobiles. The Indian government not only engaged a large number of machines for the use of its guests, but the royal party made use of them almost entirely, except on strictly state occasions. An accompanying illustration shows King George V about to enter a Standard car of British make during his visit to India.

The most interesting feature in this connection is the cordial reception given to American machines. Naturally, those utilized by the royal party and the government were of British manufacture, but a large number of American cars were used. One firm furnished no less than 70, and it is claimed that 161 were represented in the grand total. This number was sufficiently large as to occasion wide comment, and it is stated that a greatly increased demand for United States machines has been awakened in India as a result.

★

The tendency toward direct commercial relations between the United States and Servia is steadily developing, stimulated by the advantages which such trading presents and which the Servian importers are not slow to appreciate. During 1911 automobiles to the value of $6600 were imported into that country from America.

★

While the Swiss national government is looking for an excellent tourist season during 1912, and is taking steps to call the attention of tourists to the beauties of that country, it is noticeable that the contention between the peasants and the motorists in

Digitized by Google

Switzerland becomes more acute each year as the number of cars on the country roads increases. Local legislation has made motoring difficult in some places and impossible in others. These communities are so distributed throughout the country that they make travel disagreeable, and this situation acts in no uncertain measure to offset the efforts of the national government to attract tourists of this nature.

★

The total number of registrations in London at the beginning of February, according to information issued by the London county council, was as follows: Pleasure vehicles, 49,455; heavy duty cars, 3501; motorcycles, 17,234.

★

The exportation of graphite from Mexico, through the port of Nogales, during the past three years was as follows: For 1909, 1773 tons valued at $18,014; 1910, 2620 tons, $28,828; 1911, 3004 tons, $238,364; a total of 7397 tons, valued at $285,206. This was approximately the same grade of graphite each year, and was the product of several mines near La Colorado, Sonora, which are owned and operated by an American company. The following information is taken from an engineer's report recently published by the concern:

"The graphite bed, as at present mined, reaches from nine to 10 feet in thickness. It is extremely irregular in 'strike,' sharp curves coming close together. Owing to the friability of the bed, almost no explosives are necessary, most of the mining being done with pick and shovel. The analysis of run-of-mine graphite is as follows: Carbon, all graphitic, 86.75 per cent.; silica, 7.6 per cent.; iron, .65 per cent.; alumina, five per cent.

"The graphite is apparently wholly amorphous and shows no flakes like that mined in some sections of the United States, and no fibrous structure like that of Ceylon. After being raised to the surface the graphite is spread out to dry, which it does in a short time, and then is thrown up in piles to await shipment."

★

The local government board in London has prohibited the use of the muffler cut-out on motor cars, the order going into effect April 1. It seems a little strange that the new regulation does not include motorcycles as well, but the wording is very explicit, as will be seen by the following:

"He shall not use any cut-out, fitting, or other apparatus or device, which will allow the exhaust gases from the engine of a motor car to escape into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance, suitable and sufficient for reducing as far as may reasonably be practicable the noise which would otherwise be caused by the escape of said gases.

"Provided that this regulation shall apply only to a motor car propelled by an internal combustion engine and shall not extend to a motorcycle."

★

Automobilists in England are much given to the social side of motoring, frequent so-called "point-to-point" meetings being held each year. This plan appears to be much in the nature of an American picnic, in which all the motorists within a given radius are invited to join. An accompanying illustration presents one of these point-to-point meetings at Highworth, England, in which the party is encamped along the roadside for the inevitable "refreshments," which are a part of every British undertaking.

★

It appears that the Scottish Motor Trade Association was not entirely satisfied with Glasgow as the site for the annual Scottish motor vehicle show, in view of the fact that the Edinburgh city council has granted this organization permission to utilize the Waverley Market for this purpose, during two weeks in January, 1913. Until this year, the shows in Scotland have been held in Edinburgh, but it was announced last fall that it was expected much better facilities for holding a large and representative exhibition could be secured in Glasgow. Undoubtedly, it was found that the latter city was too far from the centre of motoring to attract the crowds which have visited the Edinburgh display in years past. In addition, it may be mentioned, that permission has been secured for the holding of a commercial vehicle show of two weeks' duration immediately following the pleasure car section.

Party of British Motorists Encamped at King's Royal Rifles During Recent Point-to-Point Meeting at Highworth, England.

The Touring Club de France has brought forward a plan for an automobile road about 375 miles long from Lake Geneva through the western Alps to Nice. This route will run through three Alpine passes at the Drance, Arve and Isere valleys, and thus open up some

Digitized by Google

of the most beautiful sections of the Alps. At the height of 9000 feet it will pass the Col d'Iseran, and after entering several other minor passes will reach the Car valley, which it follows for about 60 miles to the Mediterranean. It is estimated that the cost of construction will be not far from $800,000.

★

Official reports concerning the automobile industry in France for the year 1911, indicate that the increase in business expected was not realized. This is held to be due largely to the significant increase in importation of cars from America, Great Britian, Germany, Belgium and Italy. The imports from America increased from $146,680 in 1910 to $462,814 in 1911; from Great Britain, $555,454 to $609,301; from Germany, $316,713 to $484,430; from Belgium, $443,128 to $451,813, and from Italy, $207,668 to $234,881.

The exports of French motor cars for 1911 shows a decrease to a number of countries, notably America, England, Italy, Russia and Argentina. These figures show the following:

Country	1910	1911
Great Britain	$13,847,171	$10,635,072
Belgium	6,127,557	7,264,906
Germany	2,697,947	2,854,470
Argentina	2,014,534	1,830,026
Algiers	1,831,763	2,664,172
Italy	1,073,080	921,575
Russia	1,058,026	537,312
Switzerland	960,368	1,129,822
United States	926,207	731,277
Brazil	514,924	1,584,916
Spain	495,238	703,292
Austria	206,124	451,813
Turkey	135,486	332,925
All others	3,139,338	3,644,998
Totals	$35,027,763	$35,286,576

From the above it will be seen that France little more than held its own in the matter of exports. In these figures, it may be mentioned, "industrial motor vehicles" totalled $1,362,966 in 1911 as against $942,-033 the previous year.

★

The annual general meeting of the Institution of Automobile Engineers in England was held at the Institution of Mechanical Engineers, Storey's Gate, S. W., London, last month, at which time the annual reports of the officers were received, and the condition of the society was found to be highly satisfactory. The following elections to the council were made: M. C'Gorman, F. L. Martineau, Max Lawrence, J. A. Wilding, Worby Beaumont, F. C. A. Coventry, D. J. Smith, Prof. A. Sharp, A. S. Hill, G. A. Burls, Col. H. C. L. Holden, M. A. Adam, D. Leechman and L. H. Pomeroy.

The meeting was followed by the reading of an interesting paper on "Aeroplane Undercarriages" by G. de Havilland of the army aircraft school. Cinematograph views of landings of aeroplanes were shown, the author pointing out the difficulties to be met in taking up the shocks of this important part of the work of these machines. The next meeting will be held April 10, at which J. J. Guest will read a paper on "Grinding."

★

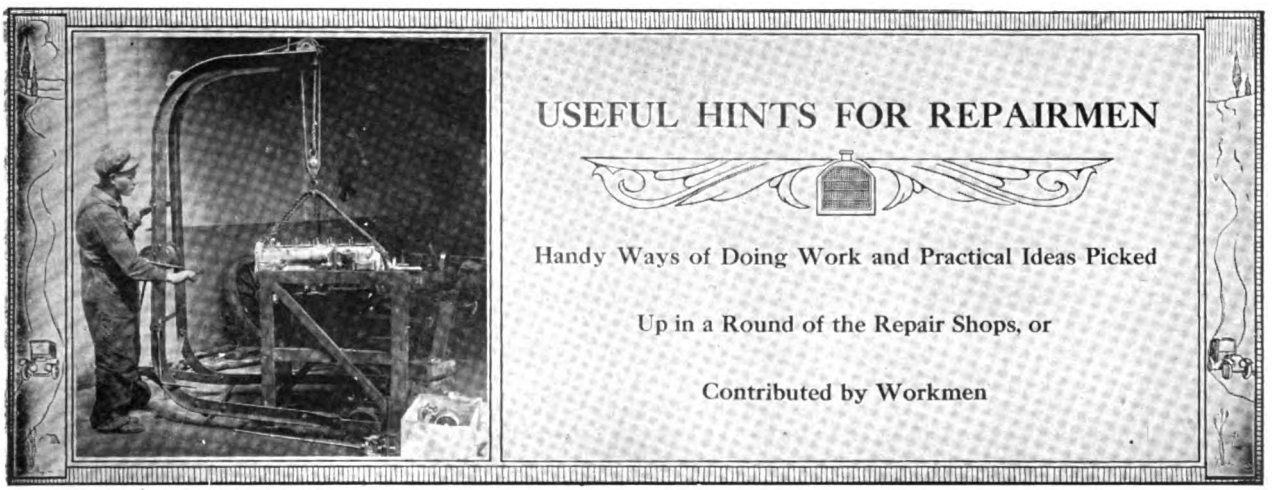
Some of the 58 drivers for the French Grand Prix race over the Dieppe course in June have been selected as follows: Free-for-all, Ford, America, Dupasse; Mathis, Germany, Mathis; Fiat, Italy, David L. Bruce-Brown, twice a winner of the American Grand Prize event at Savannah, Ga.; Ralph De Palma, also well known in American racing circles, and Louis Wagner.

In the light car class the following have been named: Lion-Peugeot, France, Boillot and Goux; Gregoire, France, Porporato, De Marne, Romano and Medinger; Vauxhall, Great Britain, Hancock, Watson and Ferguson; Alcyon, France, Barriaux and Page; Vinot-Deguingand, France, Vonlatum, and two Molons; Sizaire-Naudin, France, Sizaire and Naudin; Koecklin, France, Koecklin; Cote, France, Gabriel; Hispano-Suiza, Spain, Derney and Piliverdie.

GRAY & DAVIS INCORPORATES.

Announcement has been made of the incorporation of Gray & Davis, Boston, maker of automobile lamps and lighting dynamos, the capital being $1,200,000. This action was made necessary by the enormous growth of the business during the past year.

With the very inception of the automobile industry came the first Gray & Davis lamps. The old firm was a copartnership and the factory, a modest plant, was located in Amesbury, Mass. With the remarkable growth of the industry, of which this was an adjunct, the production of lamps also increased, until it was necessary to erect a new plant, and later to make several additions to this.



Lamps are still made in the Amesbury factory, but about a year ago the success of the lighting dynamo made it necessary to erect an entirely new building in Boston. It is a new plant, thoroughly modern in every way, and embodies the latest advanced ideas in meeting the increased demand for this product. Thus, the Gray & Davis lamp and dynamo business has actually outgrown its present manufacturing facilities and the incorporation has been decided upon as the best means of increasing its efficiency.

NEW CAR FROM DETROIT.

Announcement is made from Detroit, that a company is being organized for the production of a new pleasure car, to be known as the Thirty Roadster. The name of the concern is being guarded as a secret for the present but will be made public in the near future, it is stated. It will have a capital of $500,000.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

NEW TYPE OF MUFFLER.

With the agitation against the use of the cut-out it is interesting to note that manufacturers of mufflers are devoting considerable time to the perfection of this device, striving to reduce back pressure to a minimum as well as to eliminate noise. These members are usually constructed circular in shape but a deviation from this form is noted in the Sharpe muffler which is depicted at Fig. 1 A. It comprises three flanged and ribbed globes bolted together and mounted upon a central partitioned tube. These flanges are directly exposed to the currents of air flowing beneath the car and it is obvious that the muffler is kept at a low temperature, thus aiding the condensation and consequent loss of pressure of the exhaust.

In the drawing the upper half of the muffler is shown in section and it will be noted that the gas in entering is immediately broken up into several streams by passing through the first series of holes in the inlet member. A sudden expansion of gas then takes place in the first globe, where a certain amount of heat is radiated, after which the gases pass on through other apertures into the second globe and succeeding members, and into the open air through the perforated outlet tube. It is claimed of the muffler that smoky exhausts are reduced and that the silencer may be disconnected, cleaned and reassembled easily and in a very short time.

SHACKLE BOLT AND LUBRICATOR.

A combined shackle bolt and lubricator has been brought out by a French parts maker named Faudi, and the device presents many practical features inasmuch as it eliminates the screwing of a lubricator with a small threaded neck into the bolt which is sometimes broken easily. At Fig. 1 B is presented a sectional view of the device and it will be noted that one end of the bolt is made to form the body of the lubricator and has a thread formed within it. The lubricator cap has a coinciding thread cut upon its exterior to permit of its being screwed into the body. The cap's outer edge is spun over a plain sleeve which makes a dust tight fit around the body as the cap is screwed home in practise. The bolt is drilled centrally to take the lubricant and is also grooved to allow the grease to spread over the wearing surfaces. At C is shown the bolt with cap in position.

TOOL EQUIPMENT FOR THE SHOP.

Other measuring instruments may be included in the tool equipment of the shop than those previously mentioned, and the list may be augmented by a bevel protractor, bevel, combination square, key seat rule,

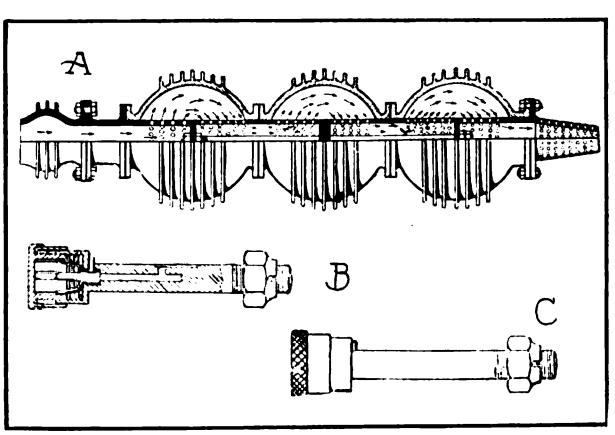

Fig. 1—A, New Type of Muffler Constructed in Two Sections, Which Is Claimed to Obviate Back Pressure; B, Sectional View of New Combined Shackle Bolt and Lubricator; C, Exterior View of Device.

try square, tram points, etc., this depending upon the nature of the work to be undertaken.

Several centre punches should be a part of the equipment and types of these are depicted at Fig. 2 C and D. These are inexpensive and come in convenient sizes having knurled bodies providing a good grip for the fingers. Similar members having smooth ends are valuable in driving out bolts, pins, etc.

At B is shown an automatic centre punch which is adjustable and is more convenient in laying out

Digitized by Google

work to be machined or drilled than the common forms. The tool is about five inches in length, .625 inch in diameter and the length of the stroke is adjustable by means of a knurled screw on the top of the handle. To set for fine work, the screw is turned to the right; for coarse work to the left. The points can be removed for grinding and are replaced easily if broken.

The purchase of a plumb bob, which is illustrated at A is optional. The tool is valuable for lining up shafting and is almost indispensable in erecting machinery. A hand vise, such as depicted at E, is very useful. They are made in several forms and so constructed as to hold small work securely.

The plier outfit should include several forms. Those at F are small flat members which may be put to a great many uses, especially when assembling small work. Wire cutters are essential, and in purchasing these members a high grade tool should be selected. Those shown at H have removable and adjustable jaws. Each jaw may be ground away to the extent of .25-inch and when used up new members may be procured. A screw through the jaw engages with a spline in the frame and draws the jaw down firmly to the toothed seat, holding it securely. Another feature in this cutting plier is a flat spring below the cutting edges and over the joint, forming a yielding seat for the end of the wire to press against while being cut. This obviates the danger of breaking the jaws, as sometimes happens with some forms of this instrument, which allow the wire to be inserted against a solid surface.

A good spirit level is important and the instrument depicted at G is so constructed that it can be adjusted accurately, and when so set is not liable to get out of true, as the vial is set in tubes having solid ends which are clamped firmly to the base. The outer tube may be so turned as to protect the glass when not in use, or when carried in the tool kit.

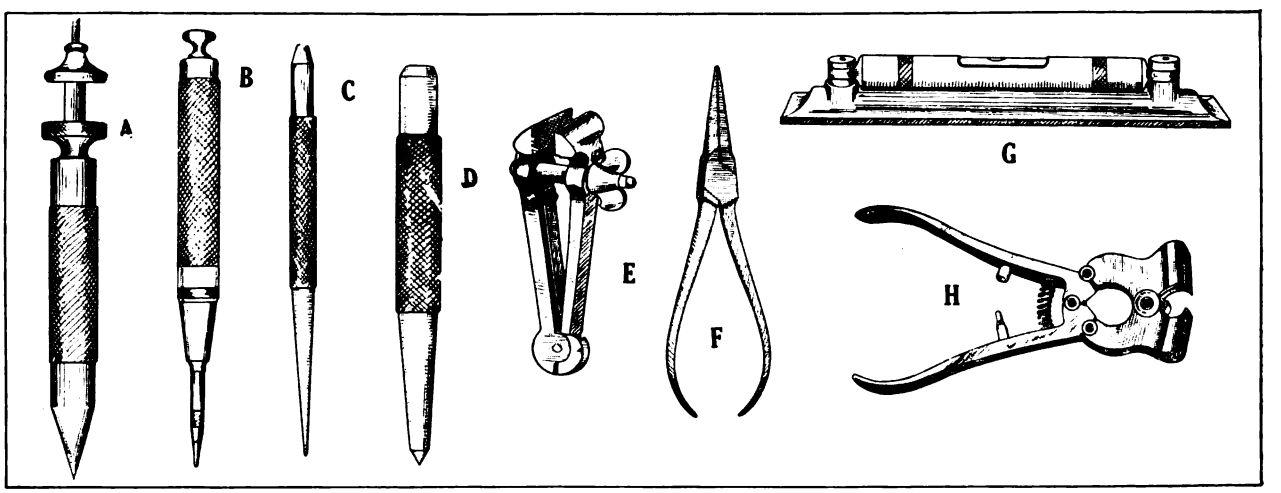

Fig. 2—Tools for the Shop Equipment: A, Plumb Bob; B, Automatic Centre Punch; C and D, Ordinary Centre Punches; E, Hand Vise; F, Small Pliers; G, Spirit Level; H, Wire Cutting Pliers.

A PATTERN MAKING HINT.

A repairman of considerable experience suggests the following method of making a pattern when a patch of peculiar shape is required to fit in an awkardly situated position and he states it will obviate the necessity of making templates: Take a piece of gutta percha, large enough to make up the required pattern. The material is placed in very hot water and allowed to remain until it becomes soft and pliable. When in this condition it is pressed hard on the place which is to be fitted with a patch, and allowed to remain until it has cooled down sufficiently to become quite hard, which will take but a short time.

After the impression has been taken, the outside of the gutta percha is trimmed to the required shape and form, and any little tape intended to allow the withdrawal of the pattern from the sand should be put on. The pattern can then be sent to the foundry, and the casting will fit into place quite snugly, with the least possible amount of filing and chipping.

NOVEL TWO-JET CARBURETOR.

A new and novel type of a two-jet carburetor, known as the Binks, has been brought out by an English concern. It differs from those of usual construction in the controlling mechanism, as the throttling member is a valve of the mushroom type; that is, it is a valve with a cone setting similar to a poppet valve in an internal combustion motor. This mushroom member controls the supply of mixture from the main jet, and one of the features claimed of it is, that leakage can occur only when the supplementary member is in service.

It is stated that when an engine is throttled down there is considerable suction exerted upon the motor side of the throttle valve, and any tendency for this

Digitized by Google

to leak is apt to cause erratic running. It is claimed by the maker of the Binks device that with the mushroom type of valve leaks are impossible because the member is held down on its seat by a stiff spring.

At Fig. 3 are presented two views of the carburetor, that at the left showing the supplementary or starting jet within its small choke tube. The mixture passes into the main induction pipe above the mushroom valve controlling the main supply. Within this part of the chamber is fitted the small sliding piston valve, this being indicated by the dotted lines. This valve acts as the throttle of the supplementary mixture supplied by the small jet, and is directly connected to the vertical throttle spindle. The latter in turn is actuated by the bell crank lever which, at its lower end, has three optional points for the engagement of a rod connecting with the lever on the steering wheel.

The main throttle chamber and the mushroom valve contained therein also are operated by the throttle rod and lever, but the first movement of the latter two takes effect only upon the piston throttle previously mentioned. This is in order to give the supplementary throttle its essential lead. After the first quarter of an inch or so of its downward movement the throttle spindle actuates both the main and supplementary members concurrently, and holds the latter wide open. Above the starting jet chamber will be noted an additional air inlet device, a partial rotation of the cover thereof serving to open or close the small orifices depicted in the drawing.

In the sketch at the right is shown the main air intake. A feature in connection with this is the design of the choke tube, which consists of a plug, passing vertically through the air passage, having a large hole bored through it in one direction to allow passage for the incoming air and a small hole from the bottom leading into the main bore and providing for the accommodation of the jet. This plug is held in position by a friction spring and may be rotated by hand if desired. The effect of the movement is to restrict or enlarge the air passage forming the choke tube, and it will be noted that the plug is in such position that less than one-half of the bore of the inlet is utilized.

The plug may be removed easily by pushing the retaining spring out of its place in a groove, which operation will disclose the jet. If the latter require attention it may be displaced with the aid of a small wrench without disturbing the other components of the carburetor.

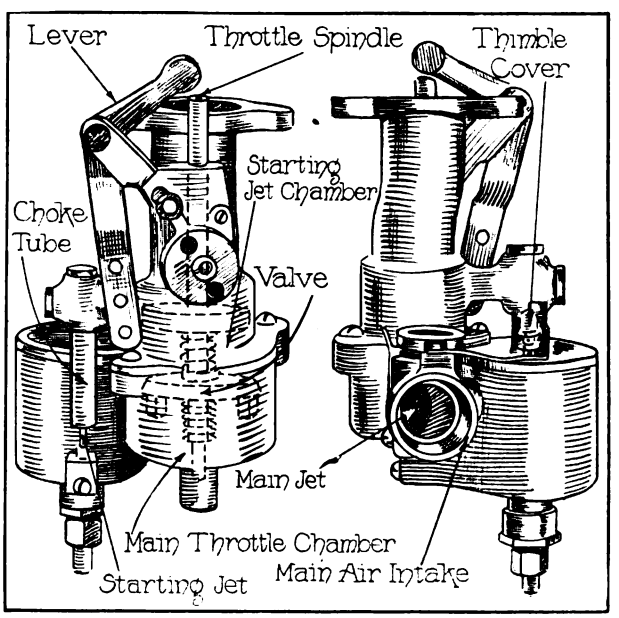
The top of the float chamber is secured by a spring which can be slipped to one side in removing the lid. The float spindle projects through the cover, but is covered by a thimble member held clear of the top of the spindle by a spring. If flooding the carburetor be desired the thimble is depressed but it is claimed that its construction is such that gasoline will not splash.

The float valve is inverted and direct acting, being at the lower end of the valve spindle. The latter is secured to the float by a split pin passing through an extension, making for easy adjustment.

FILTERING OLD LUBRICANTS.

It is surprising the amount of lubricating oil that is wasted in the average shop during the year and that more is not seen or heard of devices for economizing the lubricant. Many repairmen make it a practise when overhauling a car to throw away the old oil. In the course of a year this amounts to considerable and it could be saved if filtered properly. One owner of a shop who watches small details very carefully to keep down the overhead expense, devised a filter which, he states, proved practical and was the means of saving many gallons of oil during a season.

The device consists of a round tank, two ordinary tin funnels, waste, an extra vessel and some metal tubing. The tank holds several gallons and on the inside are soldered rings, these forming projections on the walls to retain the funnels. A fine mesh brass



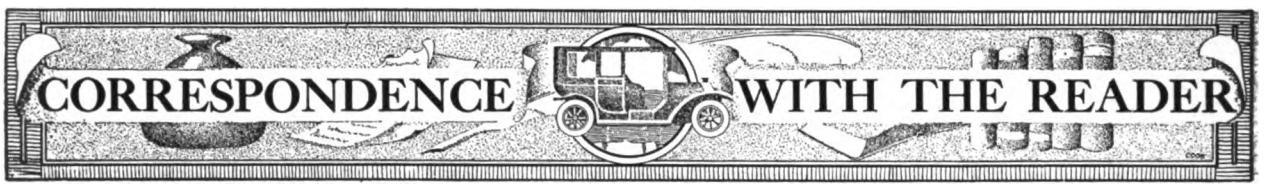


Fig. 3—Novel Type of Two-Jet Carburetor in Which a Mushroom Valve Controls the Supply of Mixture.

screen is fitted to the upper part of the container and so constructed as to be removed, this being necessary when the filtering material is renewed.

The bottom of the tank is drilled, a .25-inch copper tube soldered and led to a container. A pet cock is installed in the line so that the dripping oil may be shut off while the receiving member is being emptied or any part of its contents is being used. The waste is fitted loosely in the funnels and when the old oil is poured in at the top of the strainer the wire screen separates bits of metal and foreign elements. The fluid then passes to the first funnel, is filtered, and thence flows to the second member where the process is repeated. The oil resulting from the process is remarkably clear and the inventor of the device states that he employs it in his car where it has given satisfactory service.

Gear Ratios and Valve Timing.

(1355)—In different automobile catalogues I find the statement, "gear ratio, standard, 3.5 to one." Will you kindly explain what this means and how it is figured out? I would also like to know how to time an engine when the magneto has been removed and the firing order of the cylinders is 1, 3, 4, 2.

JOHN R. FINGAR.

Red Hook, N. Y., March 25.

By the gear ratio is meant the proportion of the driving gear to that of the driven member; that is, the number of teeth on the pinion and crown gears. The former is a small gear fitted to the end of the driving shaft and meshes with a larger member which transmits the energy of the motor to the driving or rear wheels. The standard ratio of 3.5 to one means that the pinion gear revolves 3.5 times to one rotation of the crown gear. The ratio may be two to one and even direct but these are used only where excessively high speeds are desired, as in racing.

The need for a reduction between the motor and driving wheels in addition to the transmission is obvious. If the road wheels revolved at the same rate as the crankshaft of the motor not only would the machine travel at too high a speed but it would be difficult to surmount grades. For example: If the driving wheels were 36 inches in diameter and revolved at 400 turns a minute, or at the same speed as that of the crankshaft, the machine would travel at about 30 miles an hour. To obtain a speed of 10 miles an hour the motor would have to be throttled so low that its efficiency would be greatly impaired. The power output increases in proportion to the number of explosions; that is, the rated horsepower will not be developed until a stated or maximum of revolutions is reached.

The ratio of 3.5 to one is generally employed and this may be obtained by dividing the number of teeth on the crown gear by those of the pinion. For example: If the latter have 16 teeth and the crown 56 the ratio would be $56 \div 16 = 3.5$.

Regarding the second question relative to the timing of a four-cylinder motor, this was described fully and illustrated in the Sept. 23 issue of The Automobile Journal.

Installing Self-Starter.

(1356)—Can a self-starter be installed on a crank machine so it will be a thorough success? We own a Ford model T car which has been in service one year. I would like to find out if this can be done and whether it would be successful or not. JOHN TORADO.

Superior, Col., March 30.

A self-starter could be fitted to the automobile in question and these may be divided into four classes, electrical, mechanical, explosive mixture and compressed air. There are a number upon the market which appear to be practical and to be giving satisfaction. The explosive mixture, in which acetylene is usually employed, is a simple system to install, and when fitted to the Ford car would require drilling and tapping the cylinder head for attaching the valve or other members utilized to connect the pipes conveying the acetylene to the combustion chamber. Also it would be necessary to employ dry cells or a storage battery in order to produce a spark in the cylinder by retarding the spark lever, which operation is similar to that of starting the motor on the switch.

With the compressed air type the air is introduced into the cylinder for the purpose of exerting pressure against the piston and with this system the cylinder head would have to be altered. With mechanical or electrical systems the crankshaft is rotated until the engine operates. The various systems are described and illustrated in a series of articles now appearing in The Automobile Journal.

Voltage at Magneto Terminals.

(1357)—What is the correct number of dry cells to use with a Bosch double ignition system such as is used on the ——— car and why? What voltage is delivered at the spark plugs by the Bosch step-up transformer with the dry cells reading six volts? What voltage is delivered at the magneto terminals of a Bosch magneto at ordinary engine speed? H. P. LASHER.

Cushing, Ia., April 2.

The Bosch Magneto Company, New York City, advises the use of two sets of five dry cells in series parallel with a dual system. Regarding the voltage delivered at the spark plugs by the Bosch step-up coil with dry cells reading six volts: This is a difficult question to answer, owing to the fact that this being a straight induced current, there are no instruments made for the purpose of measuring the same. The only way that coil voltages and magneto voltages are measured is by the distance the spark will jump across in the open air.

Cylinder Pressure.

(1358)—What is the number of pounds pressure, reckoned according to any standard pressure gauge, of the air in the cylinder of a gas engine like those used on automobiles, when the piston is at its highest point, assuming that there is no leakage? S. O. PITTS.

Archer, Neb., April 5.

The pressure when measured with a standard pressure gauge will vary according to the design of the motor. In some types it may be as high as 75 but this is the exception rather than the rule. From 40 to 75 pounds would be a conservative estimate.

Noisy Valve Tappets.

(1359)—I have a 1909 model ——— four-cylinder car. The valve tappets make a lot of noise and when ad-

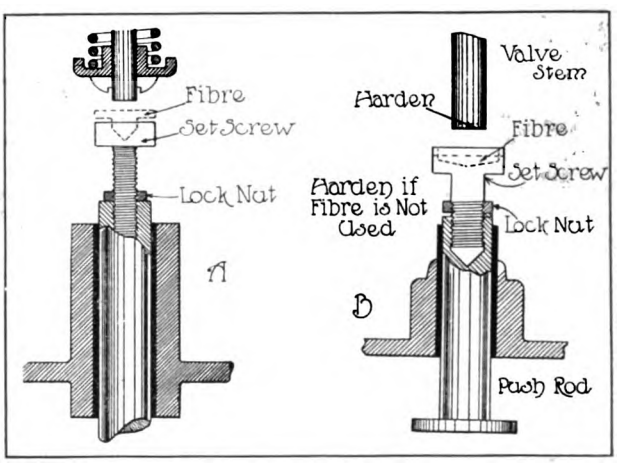
Digitized by Google

justed up close to eliminate the clatter, the compression is lost. Is there any way to stop the noise?

H. S. TOWER.

Sioux City, Ia., April 7.

The worn parts may be replaced with new members or repaired. On the type of motor referred to the clatter can be eradicated by inserting fibre as shown at A in the accompanying illustration, which depicts a conventional type of adjustable tappet. The plungers should be removed complete, taking care to mark each, unless already so numbered. As the valves will have to be removed it will afford an excellent opportunity to inspect them and grind if needed. Before removing the plunger, however, much time will be saved by measuring the space between it and the tappet. This should be done when the motor is warm to secure accurate results, also to ascertain whether or not there will be sufficient space to insert a reasonable thickness of fibre. All measurements should be taken with the valve seated.



To ascertain if the space between the tappet and plunger will permit of the use of .125-inch fibre or more, the lock nut should be loosened and the set screw turned down as far as it will go. Assuming that the space permits of the use of .25-inch fibre, more or less, the T head, as shown in the sketch by dotted lines, is best, as by using a thin flat file the indentations made by the constant hammering can be removed. Take a piece of fibre, preferably French, .75-inch, which will be large enough to permit of turning down. Next cut out pieces larger than the diameter of the set screw. The latter having been removed from the plunger, the temper is drawn and then placed in a lathe and a bottomed hole drilled .375 inch in diameter and any convenient depth. A better way is to use a regular drill which will necessitate turning a teat on the fibre. The fibre is then placed in the lathe and one end turned slightly in excess of .375 inch in diameter in order that a drive fit can be made in the head of the set screw.

Allowance should be made in turning the stem of the T fibre that fits into the recessed set screw head so that when the drive is effected the fibre will seat firmly at all points. The fibre is next driven in the set screw head, after which it is placed in the lathe and the T section of the head turned to the diameter of the head of the set screw. The latter is then placed in the plunger and inserted in the motor for adjustment.

Another method is shown at B, which also depicts fitting a non-adjustable tappet with means for setting. Here the tappet is drilled out as shown by the dotted lines and the fibre turned for a drive fit and forced in position, after which the material is trued up with a smooth file. This method is preferable where the head of the tappet member is larger than the diameter of the valve stem and where the latter strikes in the centre of the tappet.

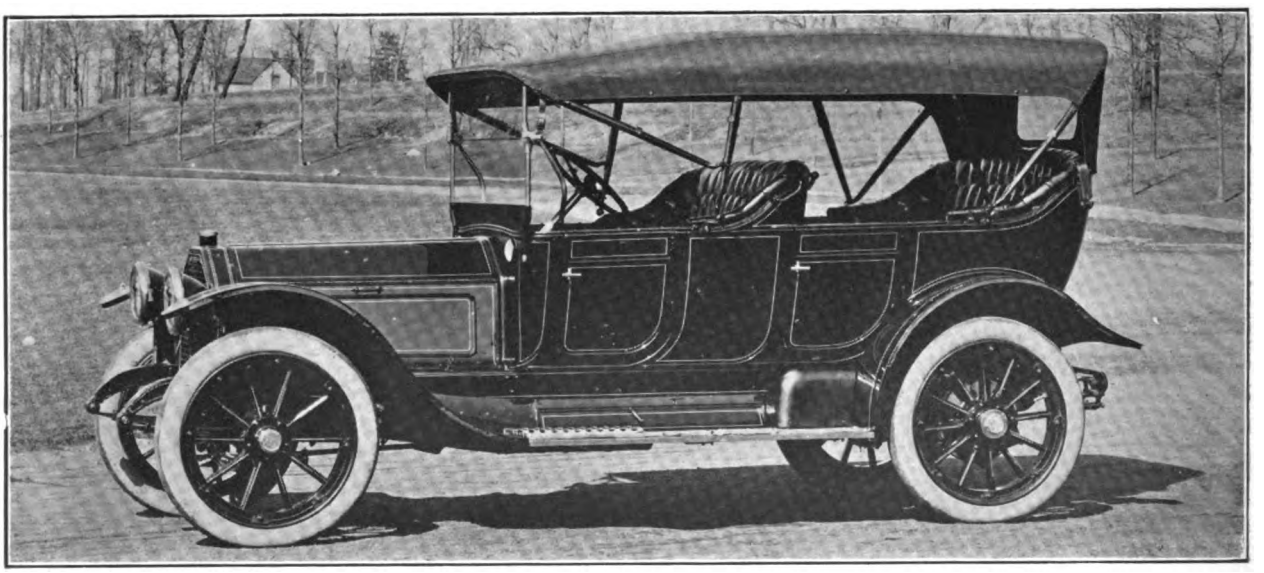
While at first glance it would appear that on some types of motors there is not space enough to permit of the addition of a set screw and locking nut it can be accomplished usually by cutting off the pushrod bushing, if it extends above the crankcase wall, or by shortening the valve stem and valve spring. This can be determined by measurement. Assuming that the space permits, the valve and pushrods are removed. If there be space enough to add set screw and lock nut by cutting off pushrod and bushing, it will not be necessary to remove valves. If such prove the case the work is made easier. After measuring the thickness of head of set screw and lock nut to determine how much will have to be cut off the pushrod, the temper should be drawn to permit of drilling the hole as described at A.

The pushrod may be drilled .3125 or .375 inch or more in diameter as it may need. It is then tapped. Care should be observed in drilling the hole that it will be deep enough to allow the set screw and lock nut to be screwed down snugly against the end of the

Quieting Noisy Tappets: A, Fitting Fibre Insertion to Head of Tappet; B, Method of Converting Tappet into Adjustable Member, also Equipping Same with Noiseless Material.

pushrod. The insertion of the fibre can be made as referred to in the description of A. Should it be decided not to use a fibre insert, the head of the set screw must be hardened, as well as the end of the valve stem, provided the length of the latter were reduced.

In adjusting these members, which operate the opening and closing of the valves; that is, timing, it should not be guess work. A common rule is to leave a space between the valve stem and tappet of about the thickness of an ordinary business card, and while this may be practicable with many motors the best method is to time the valves by the marks on the flywheel. The majority of makers indicate the proper opening and closing of the valves upon the periphery of the flywheel, also fit an indicating arrow for checking the marks. The operation was explained fully in the issue of The Automobile Journal for Sept. 9.



Digitized by Google

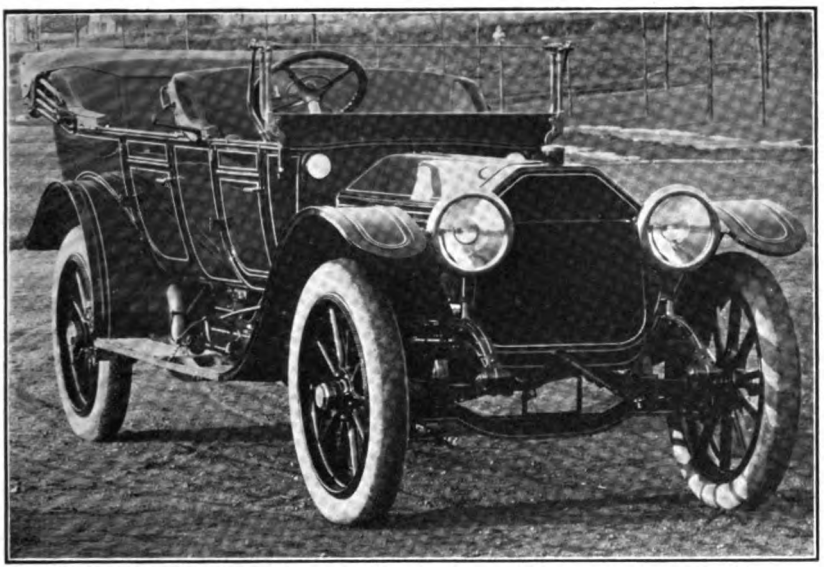
PEERLESS MOTOR CARS FOR 1913.

THE Peerless Motor Car Company, Cleveland, O., has announced that the cars it will produce for the season of 1913 will be practically a continuance of the type it is now offering in the market, with such refinements as have been dictated by experience and careful experimentation. The Peerless company is one of the best known automobile builders in America and its vehicles have been consistently of high grade. Not often are material changes made in Peerless machines and types produced have been developed and refined with consistent care. The policy has been to practically standardize models, in keeping with which the company will produce five chassis sizes for 1913, of the same dimensions and with power plants of the same capacity as those built by this concern for the 1912 season.

produce power considerably in excess of the standards established by the company. The engine of the "38-Six" has four-inch bore and 5.5-inch stroke, that of the "48-Six" 4.5-inch bore and six-inch stroke, and that of the "60-Six" five-inch bore and seven-inch stroke. The ratio of stroke to bore with these is respectively 1.375 to one, 1.333 to one and 1.40 to one, placing them in the classification of long-stroke motors. The "40-Four" motor has a bore of five inches and a stroke of 5.5, the ratio of stroke to bore being 1.10 to one.

All the motors are powerful and smooth in operation with high efficiency and silence especially desirable. The six-cylinder engines have that extreme of flexibility characteristic of the type, the long stroke and the Peerless construction. The design of the

The Peerless "38-Six" Touring Car, 1913 Model, with Top Elevated.



The company by its statement has emphasized the fact that Peerless cars in design and construction have been justified by continued service under all conditions and that in the minor betterments made in machines for next season the purpose has been to harmonize the entire assembly to a larger degree. The fact that there will be no constructional changes may be accepted as evidence of the merits of the machines, for when summarized it may be said that the improvements to be made will be with reference to auxiliaries only.

There will be three six-cylinder chassis, these being designated by the power as "38-Six," "48-Six" and "60-Six," and two four-cylinder chassis similarly defined as "40-Four" and "24-Four." These ratings are the even figures obtained in the horsepower formula of the S. A. E., the fraction being eliminated from the designation. These motors, without exception, will

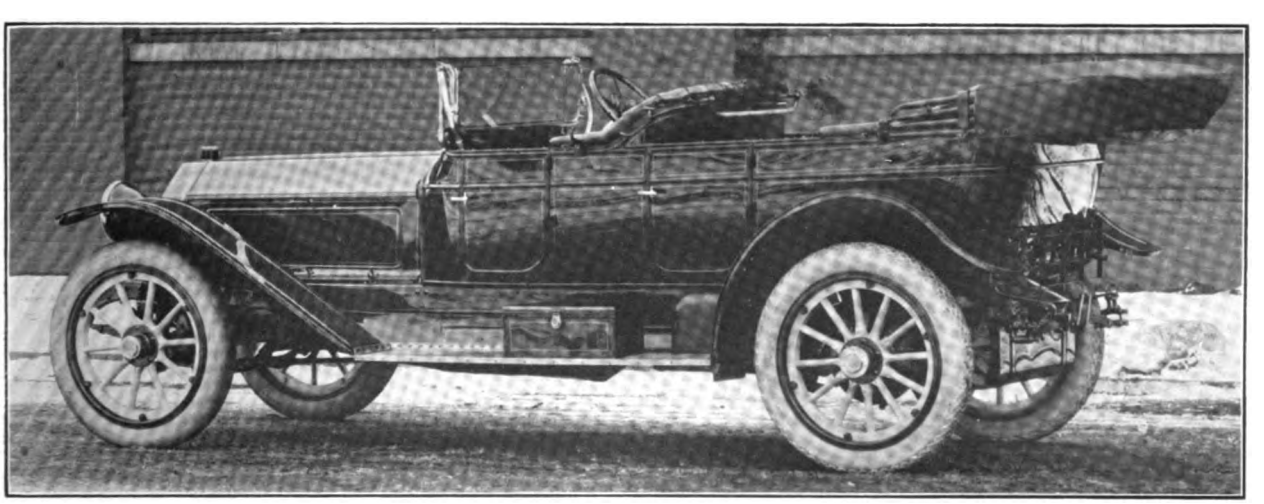
engines and the installation in the chassis are such as to afford full accessibility that there may be the largest economy of time in giving necessary attention or making repair or restoration. This applies to all components of the power plant assembly. This quality is fully realized by those having experience with motor car operation.

Elimination of possible causes for annoyance and simplification have been the principal purposes in the refining of the Peerless chassis. Conditions that might result in complications have been studied and improvement determined. The Bosch dual ignition system has been adopted and will replace the Bosch double synchronized method, this simplifying the energizing of the motor by eliminating one set of spark plugs, one series of wires in the distributor installation, and the battery commutator, the last being driven by a bevel gear from the crankshaft. With the

Digitized by Google

Front View of the Peerless "60-Six" Touring Car, 1913 Model.

spark plugs being supplied with energy from the magneto, or from the battery through the distributor of the magneto, the electrodes are always clear and in condition to fire the engine efficiently.



The vulcanized rubber rod in which the wire leads of the ignition system are imbedded, used on the 1912 cars, has been replaced by a made-up wire bar that is more compact, is lighter and permits a mounting that is less conspicuous. The neatness of appearance of the motor is decidedly enhanced and the motor at the intake side is much more accessible. This has made possible the elimination of two connections in each lead from the magneto to the spark plugs, a factor of some importance. The conductors are the more perfectly insulated and have greater efficiency electrically. Each conductor may be removed or replaced without removing the entire unit.

The dynamo of the Gray & Davis lighting system is so installed that it is driven by belt from the fanshaft instead of from the pump shaft. The speed of the generator is greater when compared with the crankshaft and the dynamo can effectively charge the storage battery or supply the driving lights when the car speed is 10 miles an hour.

The system for engine lubrication, by splash, is unchanged. In this a tank of about a gallon capacity is bolted to the engine case. A hand pump attached to the tank affords means for filling the engine case compartments, this supplementing the mechanically driven pump that circulates the lubricant through a tube system and sight feed gauge on the dash from the oil reservoir to the engine case pits. The two drain cocks of the crankcase are linked to a single lever so that both may be opened at once. This lever is so located that it is impossible to lock the hood on its seat when the cocks are open and the car cannot be driven with the oil draining, so that burning a bearing from lack of lubricant is an impossibility.

In the control of the fuel gas supply a damper throttle will replace one of the piston type. The action of the damper form is more positive at slow speed, owing to the fact that an equal movement of the steering column hand lever or the foot accelerator causes a less effective opening or closing of the throttle. At high speeds there is less obstruction to the passage of the gas from the mixing chamber of the carburetor to the explosion chambers of the cylinders. The device is lighter and the parts are less in number.

The radiation is efficient, the water being forced through the water jackets of the motor and the radiators of the Peerless design by a centrifugal pump, driven by herringbone gears that are noiseless in

The Peerless "48-Six" Touring Car, 1913 Model, with Top Lowered.

Digitized by Google

operation, and that perform their work well.

Passing from the power plant the practical and satisfactory expanding band clutch, with cork inserts, is contained without change. The Peerless arched rear axle, of the full floating type, a distinct and exclusive feature, has the qualities of appearance, strength and mechanical efficiency. The weight of the car is carried by the outer axle. The cast steel differential case is bolted at either end to the flanges of heavy gauge steel axle tubes that carry the wheels at the outer end. The power is transmitted through live axle shafts operating clutch plates in the rear wheel hubs. The wheels are dished to secure greater strength and minimize the effect of side thrust. Three point spring suspension is the practise, the springs being of special imported Krupp silico-manganese steel.

The bodies for all models save the "24-Four" are touring, torpedo, limousine, landaulet or berline, with the addition of roadster and coupe bodies for the "38-Six." The bodies for the "24-Four" town car are limousine and landaulet. With these dome side lamps set into the dash replace those of the bull's-eye type that were hung on a bracket, this change preserving lines and surfaces that were formerly broken. The lamps are an integral part of the superstructure and being with ground lights are appropriate to any treatment. The stays of the glass front that slanted across and cut the lines of the bonnet are turned back to the body parapet in the latest designs. Shorter and lighter than before, the stays may be used as handles to assist one in entering or leaving the front seat of a car. To these stays the straps of the raised top are attached. The control levers are all within the bodies, which are made unusually wide to insure comfort in driving, permitting the passengers the greatest freedom of movement. The extra tires are carried in recesses in the running boards that drop the tires below the parapet of the body and out of the way of the passengers. The chair seats in the tonneau fold out of sight.

TIRE SHORTAGE POSSIBLE.

According to J. C. Matlack of the Ajax-Grieb Tire Company, Trenton, N. J., maker of Ajax tires, manufacturers are expecting a tire shortage during the coming season. He says: "This condition is brought about not alone by the largely increased number of new automobiles, but also because the old cars need tires, too. Foreseeing this shortage, the leading makers have increased production estimates, but they will be sold out early, in spite of this precaution.

"New territory for the automobile dealers is being opened and exploited every day. The tire dealer must of necessity follow closely. Districts formerly untouched by motoring, have thus become active producing centres for the tire man. It is an easy thing to explain the inevitable tire shortage in 1912."

COMING EVENTS.

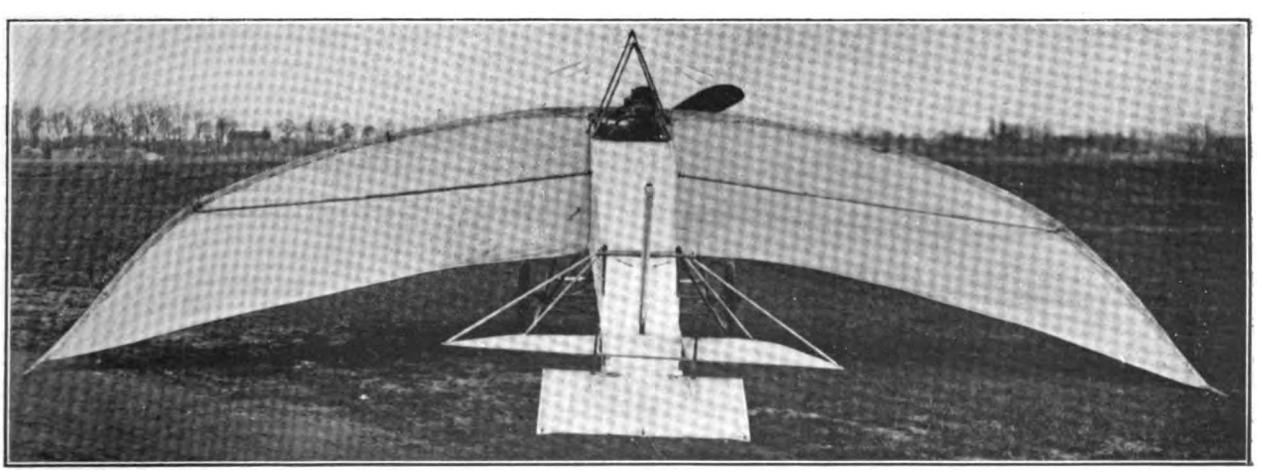
WOMEN ENJOY NATIONAL CARS.

Women have for some time been a strong factor in molding the design of automobiles, according to George M. Dickson, general manager of the National Motor Vehicle Company, Indianapolis, maker of National cars. The new models of this make, fitted with left hand drive, centre control levers and self-starting device, are making a decided appeal among women motorists. Mr. Dickson explains this as follows:

"With the left hand drive, women are able to drive with more assurance. They are able to get a clear view of the road ahead when desiring to pass other vehicles, and it is possible to take turns in crowded city traffic with much greater safety. The instinct to reach for the control levers with the right hand is not lost with the centre position for these. Moreover, easy access to the front seat is afforded with this construction."

Universal lighting means the safe use of public ways at night. It need not inflict unreasonable restrictions on anyone. Why not follow Massachusetts' example?

Digitized by Google



The fourth international race for the Gordon Bennett cup will be flown at Chicago, Ill., Sept. 9, the Aero Club of America having inspected the field selected by the Aero Club of Illinois and decided upon the date. The committee which viewed the course holds it is the best that has yet been selected for this race. The revised list of entries is as follows: France, three; Belgium, three; Holland, one; Switzerland, one; Great Britain, two, besides the three from America, making a total of six countries to be represented by 13 aviators, according to the present plans.

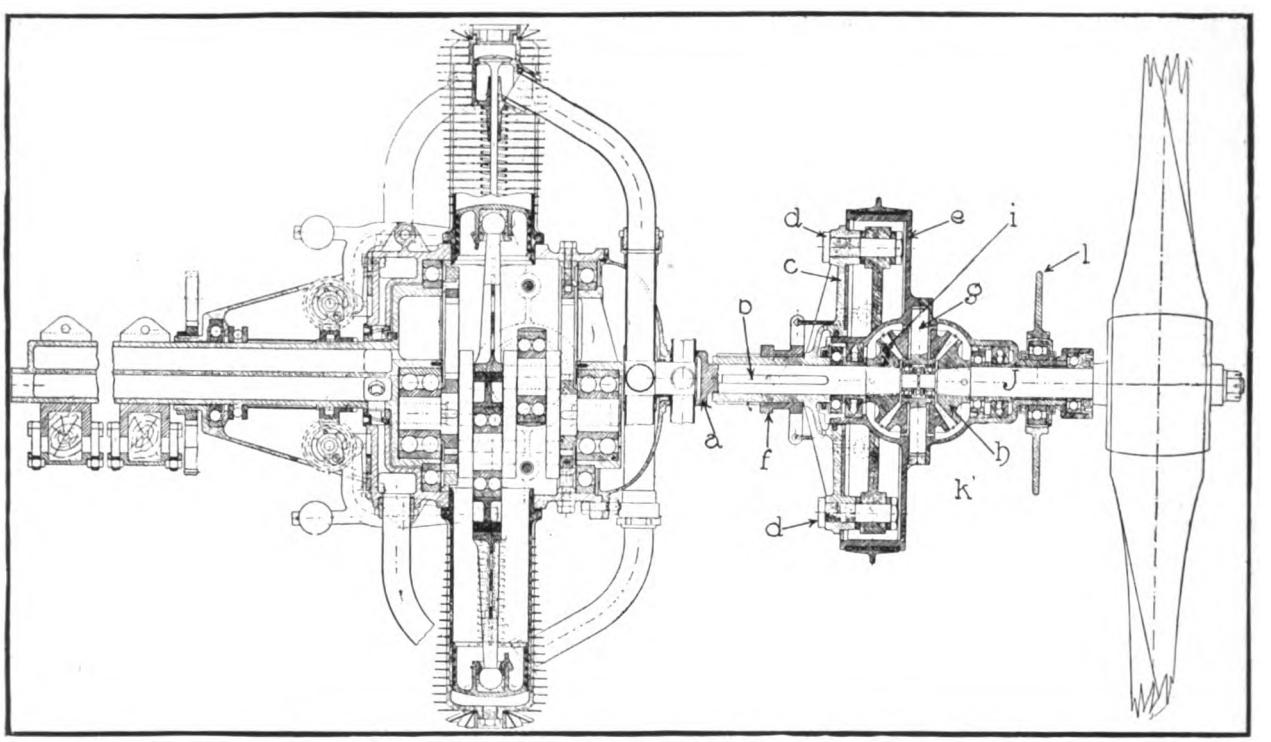
While complete details as to the final outcome of the world's first hydraeroplane meet at Monte Carlo are lacking, it would appear that the Curtiss machines were somewhat outclassed in passenger carrying ability by those of French manufacture, some of which were manifestly redesigned for the occasion. The explanation of the system for marking is somewhat indefinite, but appears to have been based largely upon the number of persons carried as well as the matter of altitude reached and the ease with which the machine started from and alighted on the water.

Pending further details concerning the meet, the following results are somewhat unsatisfactory: Fischer won first place with 48.7 points in a reconstructed Henri Farman biplane; Louis Paulhan was second with 40.8, flying a Curtiss hydraeroplane, while his teammate, Hugh Robinson, was third with 33.9. Renaux in a Maurice Farman was fourth with 33.7; Caudron in a Caudron "canard" was fifth with 30, and Colliex with a Voisin sixth with 28.5. Other aviators who took part were Benoist, Rugere and Cunne, but it is not known what machines they flew.

An accompanying illustration presents a new and rather novel monoplane recently brought out in France and termed the Licat du Breul. It will be noted that an attempt has been made to gain a large supporting surface with corresponding reduction in waste space. The spread of the wings is 35.6 feet and the total length 33.5 feet. The fuselage is completely enclosed and extends beyond the remarkable sweep of the wings to a fixed empennage, with hinged elevator and rudder. The control is assembled in a unique wheel device at the forefront of the main plane. Thus far, little information has been received in this country as to the demonstration of this machine's ability in actual flight.

The Wright brothers have announced their intention of appealing from the decision of the German patent court, which recently held that the Wright patents had been invalidated in that country. Under the laws of Germany, a disclosure of an invention by

Novel Licat du Breul Monoplane Recently Produced in France, in Which the Distinguishing Feature May Be Termed the Exceptional Wing Spread.



Digitized by Google

the inventors, or by anyone else who has knowledge of it, before the application for a patent is filed is sufficient to render the patent void. The evidence before the court showed that Octave Chanute, in an address before the Aero Club of France in April, 1903, made use of the following statement regarding the experiments of the Wright brothers at Kitty Hawk, N. C., in 1902: "To assure transverse equilibrium the operator works two cords which warp the right and left wing, and at the same time adjust the vertical rudder."

The court held this was sufficient to void the patent, inasmuch as the application was not filed in Germany until after this speech. The Wright brothers claim that the decision of the patent court is not based on the proper interpretation of the law, in that it is possible to reduce the speed of the propeller, and if necessary to reverse it, without uncoupling the motor or reducing its speed in any manner.

It will be understood that by the use of this device it is possible to allow the motor to continue running at slow speed while making a descent against the wind, thus having it ready at all times to start the propeller at full speed should it be found necessary to change the course, or to ascend again in order to find a safer landing place. It is further claimed that the ability to drive the propeller backward at any desired speed will permit of retarding the movement of the aeroplane with respect to the wind which is carrying it beyond the point selected for a landing.

The construction of this device is as follows: To the extension of the motor shaft a is connected a

Buchener Brake of German Construction, Designed to Eliminate Danger of Accident in Making Aeroplane Landings Under Difficult Circumstances.

that the disclosure was by no means sufficient to enable anyone to construct a successful aeroplane.

In view of the number of aeroplane accidents resulting from an attempt to make a satisfactory landing under unsuitable circumstances there has been a determined effort upon the part of constructors to bring out some kind of safety attachment in the nature of a brake, which shall act to check the forward speed of the machine without in any way causing additional disaster by tipping it over. An accompanying sketch brings out the details of the braking device produced by M. Buchener, Koln, Germany, and consists of the assembling of differential gearing between the motor and propeller in such manner flange c, by means of its sleeve axle and key b. This flange supports at its outer edge two bolts d d, which hold the two shoes of the expanding brake situated inside the brake drum e. This brake drum also contains an outside brake fixed to a point operated by a lever not shown in the drawing.

The inside or expanding brake is operated by the sleeve f. The casing e carries a differential gearing in much the same manner as the differential casing of an automobile rear axle. The cross shaped bearing g, carrying the smaller differential gears, is fixed to this casing, while the larger differential gears h and i are fixed, one to the propeller shaft j and the other to the extension of the motor shaft a.

To drive the propeller forward: The outside

Digitized by Google

brake is let loose, while the inner brake is expanded so that the shoes press against the inner wall of the brake drum, taking this drum and the differential casing around with the revolutions of the motor shaft. The small gears k act as a coupling between the two larger gears h and i and the casing e. As can be seen by the drawing, in this position of the brakes, the propeller shaft must be driven at the same speed as the motor shaft.

When it is desired to run the motor without the propeller, the two brakes are loosened so that the flange c can revolve independently of the casing e. The small differential gears are driven in a waltzing movement around the gear h, which is then stationary, and the shaft of the propeller, by the gear i of the motor shaft. The casing e also revolves around the axle of the main shaft, being carried around by the cross member g.

To drive the propeller backward: The inside brake is loosened, while the outside brake is tightened so that it holds tightly the casing e, to which are fastened the small differential gears. As these gears are held by the casing and cannot revolve around the main axle, but simply turn on their own axle, being driven by the gear i on the motor shaft, they only can serve to drive backward. As this gear is attached to the propeller shaft, the propeller therefore is driven in the same direction.

The flange l supports the differential casing and all shafts turn on ball bearings. The motor, which is connected to the transmission by means of a universal joint, is of the revolving type. It is air-cooled and also turns on ball bearings.

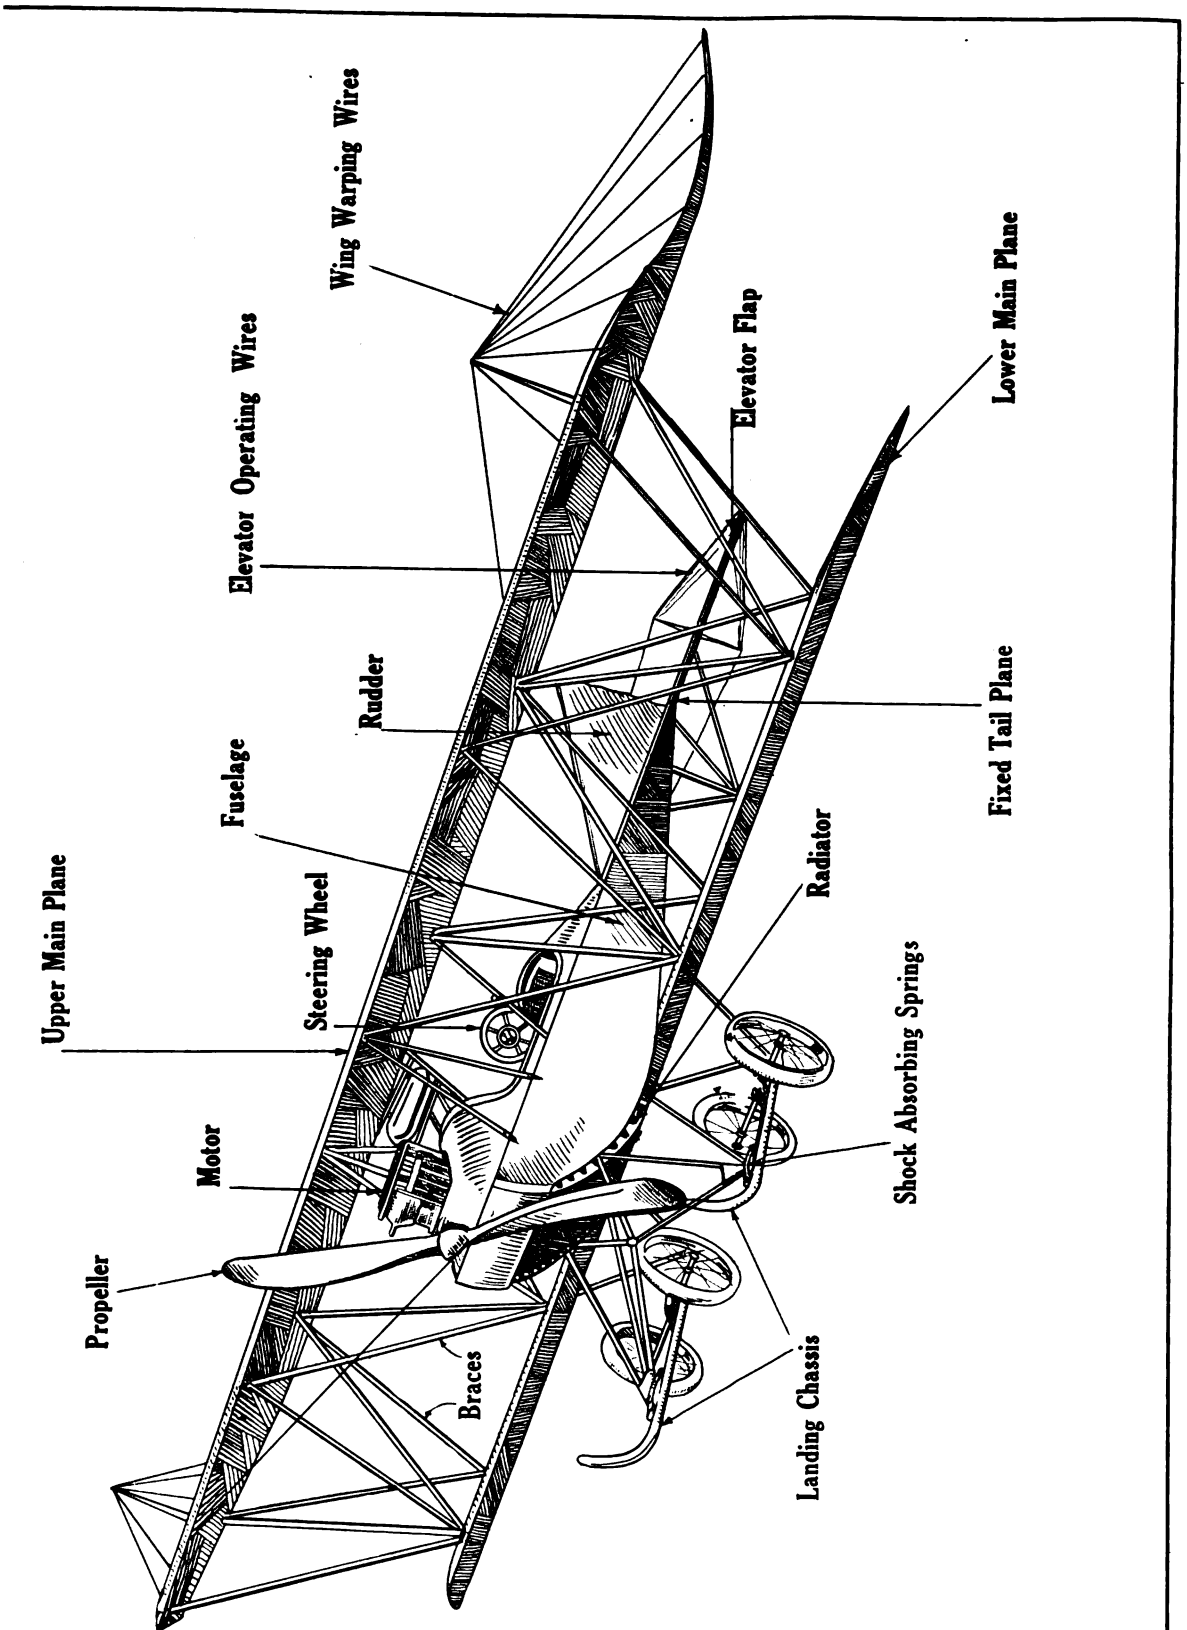
The first hydraeroplane meet in this country will be held on New York bay and the Hudson river, May 4, under the auspices of the Aero Club of America. The events will include a speed contest, which will start at Coney Island, the finish being at Sailors' monument. There also will be bomb throwing contests and a competition for quick getaways. Trophies for the various events have been offered by the club, and a number of entries have been received, although the list will not be made public at present.

Miss Mary Davis of England is the first woman to cross the English channel in an aeroplane, having accompanied Gustav Hamel in a Bleriot monoplane, April 3. The party left Hendon, England, at 9:38 in the morning and landed at Saint Ingelvert, France, at noon, without incident. After a short stop at this point the machine made a second ascent and alighted on the flying field at Issy les Moulineaux at 5:55 in the afternoon.

So far as is known the first use of an aeroplane as an ambulance was by George W. Beatty at Nassau Boulevard flying field, Long Island, March 31. Oliver B. Sherwood, who had been flying a Church biplane, lost control of his machine and was dashed to the ground. The machine was wrecked and Sherwood was severely injured. Beatty, in a Wright biplane, happened to be near, and placing the injured man in the empty seat beside him, flew to the Nassau hospital, where it was stated that the flight through the air had greatly revived the patient.

The District of Columbia court of appeals has reversed the decision of the commissioner of patents, and has authorized the reinstatement of the application of Hugo Mattulath of New York for a patent on a flying machine, filed Jan. 8, 1900. When this application was examined, the official report on its read as follows:

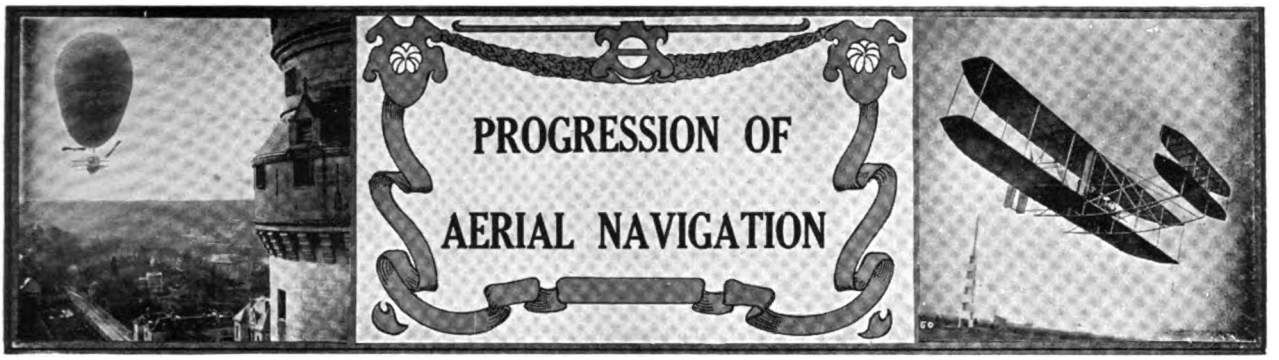
"No successful attempt has yet been made to rise from the earth's surface by means of an aerial vessel unprovided with a balloon," and concludes with the observation that "the practicability of the apparatus is so problematical that actual demonstration of operativeness will be required before the grant of a patent."



Mattulath died soon afterward and it was not until 1909 that his widow found the application. The Wright biplane was perfected some time after the date on which the application was filed, and it is claimed that the much discussed wing tip flexing device was contained in the Mattulath invention. Suits will now be brought against the Wright brothers, Glenn H. Curtiss and others, based upon a prior right to the inventions patented by them.

Henri Wynmalen of Holland, who is looked upon as a possible representative of that country in the international race of 1912, has been testing out a new Oertz monoplane in Germany with excellent results. It is claimed that during these tests the machine developed a speed of 90 miles an hour.

It develops that the world's endurance record for four passengers, made by Adolf Rentzel at Munich, Germany, Feb. 17, was with an Otto biplane, equipped with an Argus motor and utilizing a Bosch magneto, made by the Bosch Magneto Company, New York City. Rentzel remained aloft with his four passengers 21:45.



Glenn H. Curtiss has brought out a new double steering wheel for use of instructor and pupil in learning how to operate an aeroplane. The device comprises two wheels attached to one common steering post, controlling the action of the rudder, etc. The method differs materially from that used on most machines, in which the steering wheel is arranged so that it may be swung from side to side, for use by either occupant of the machine as desired. Through the use of the new Curtiss double wheel, it is possible for the instructor to allow the pupil full opportunity to operate the machine, without entirely losing control himself.

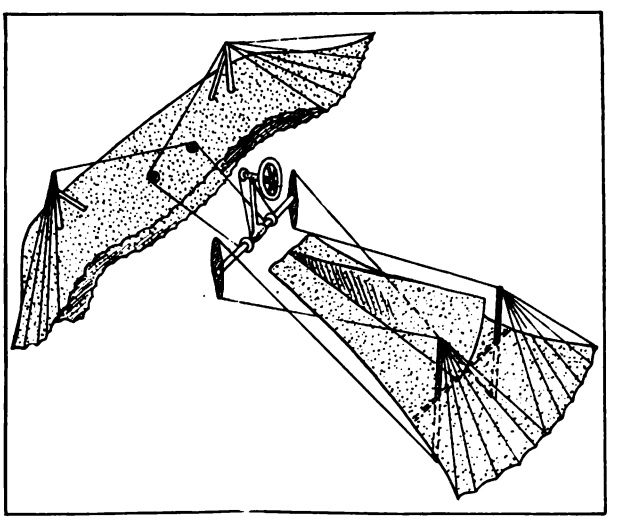
Perspective View of Albatross Monoplane, a German Machine Possessing Several Interesting Features of Design and Construction.

Digitized by Google

THE ALBATROSS BIPLANE.

Although America more generally associates aviation in Germany with the dirigible balloon, the fact remains that some very creditable and original aeroplane designs have been produced by German constructors. Not the least interesting of these is the Albatross biplane, constructed along lines somewhat reminiscent of the Etrich monoplane in Austria, although the methods employed are distinctly dissimilar. The initial design was for military purposes only, although it has now been standardized, and it is said that it is possible to secure a monoplane along the same lines, as well.



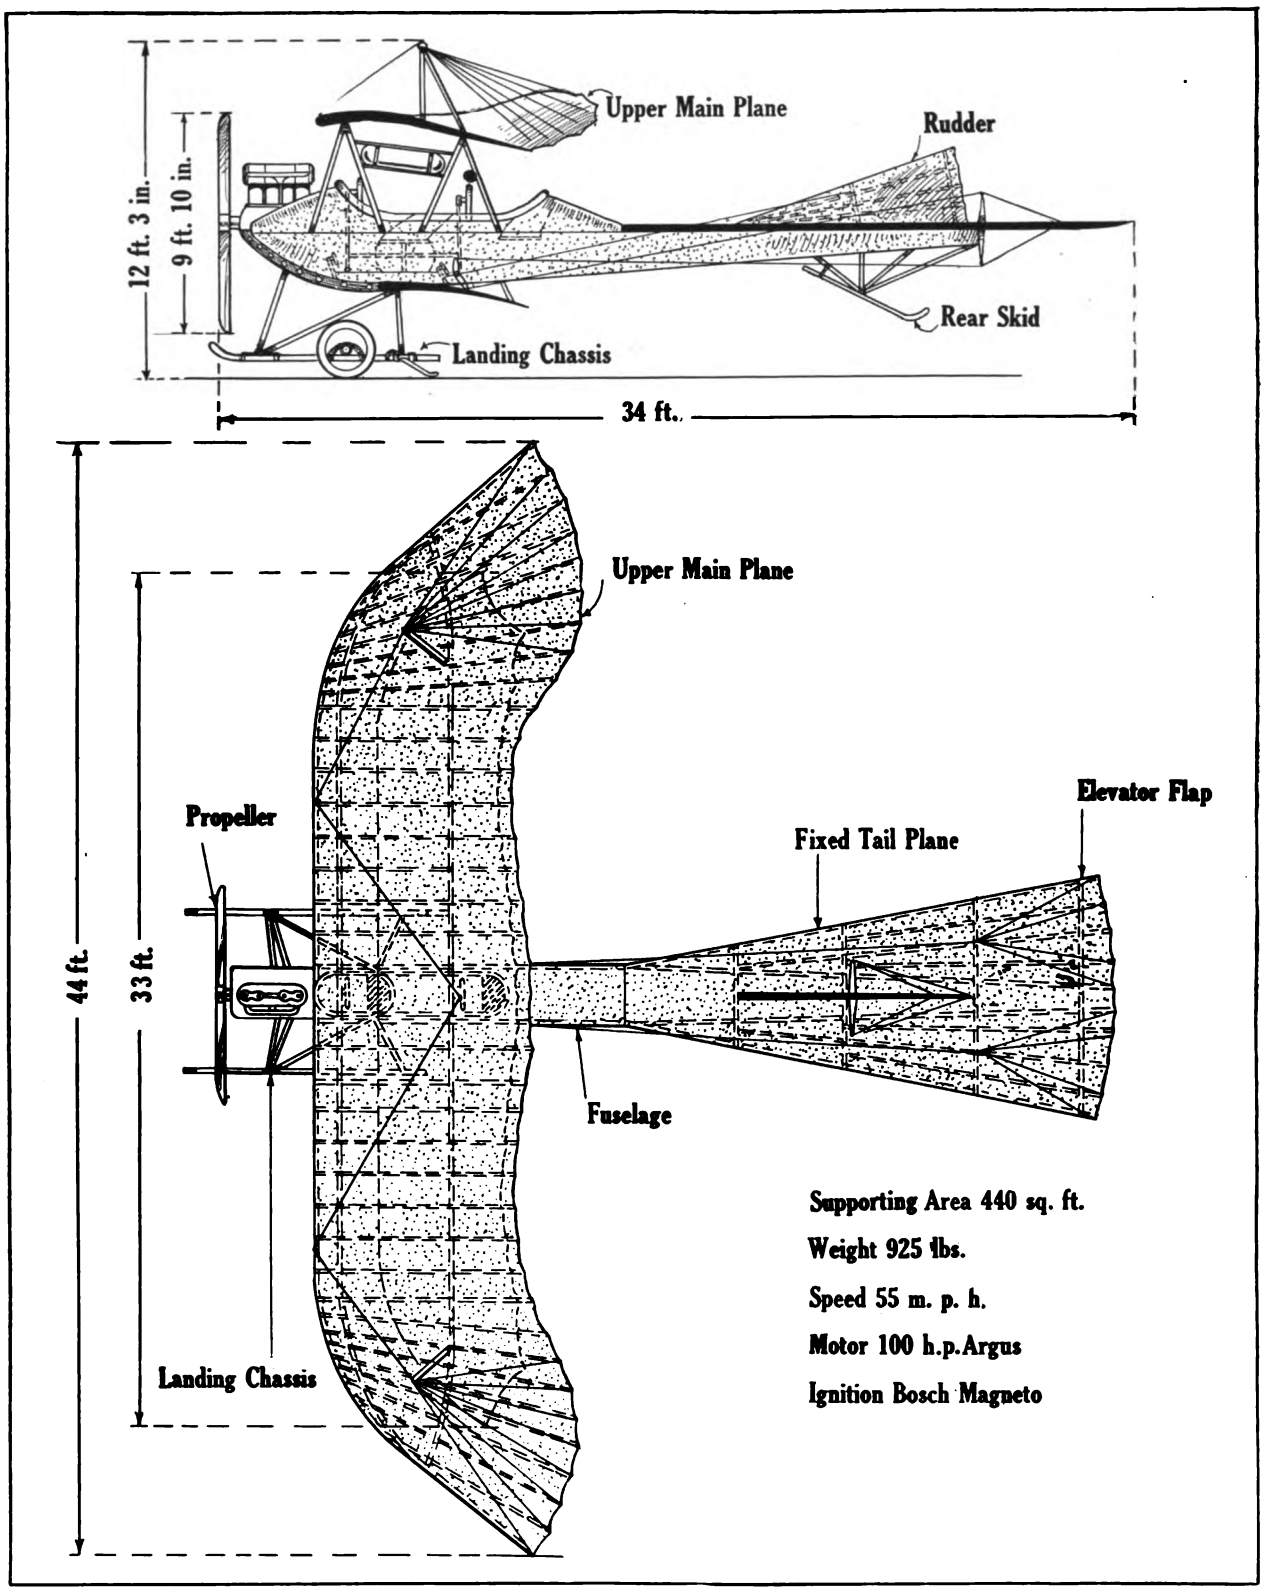
For some reason, the French constructors always have looked upon the Albatross in a spirit of contempt. The name may have occasioned this feeling, although it must be said that it aptly describes its appearance when seen at a distance and from the side. In that case, the flexible end of the upper main plane assumes the outlines of a bird's wing in a very much more suggestive form than with any other machine built.

It should be said at the beginning, that the workmanship on this machine has been very carefully executed. At the recent international salon in Paris, no aeroplane on exhibition displayed a finer attention to detail than the Albatross. It has demonstrated its practicability in extended flight, and there is absolutely no reason why it should not be considered as a thoroughly perfected type.

The main planes are staggered, all the bracing between them being accomplished by ferruled wooden struts, of which there are a large number. The lower plane is somewhat smaller than the upper and slightly shorter. Both are designed along what may be termed Etrich lines. However, the upper plane is of a distinctly original conception, as has been indicated above. Both wings are double surfaced.

No wires are employed for bracing, and the wooden struts are 2.5 by one inch at the middle point and taper to 1.125 inch diameter at either end. Here a round 18 gauge, 1.25-inch diameter tube is fitted, and two .1875-inch rivets hold rigid the 10 gauge tongue plate which acts as the joint to the plane. Wing warping or flexing wires are attached to the top of the upper plane, their operation being explained in more detail later. A and B in an accompanying sketch set forth the method of construction employed in the wings themselves, and it will be noted that the entire trailing edge is flexible, although only the tips are warped.

The fuselage is covered with a thin veneer of wood throughout its entire length, with the exception of the forward end, which is encased in thin aluminum. The radiator is disposed under the front and below the engine mounting, where it is held to secure the maximum amount of cooling air from the propeller, which is at the extreme front. In addition this engine mounting and radiator location add to rather than detract from the graceful appearance of the assembly.



Sketch Indicating Control of Wing Warping and Elevator Wire on Albatross Monoplane.

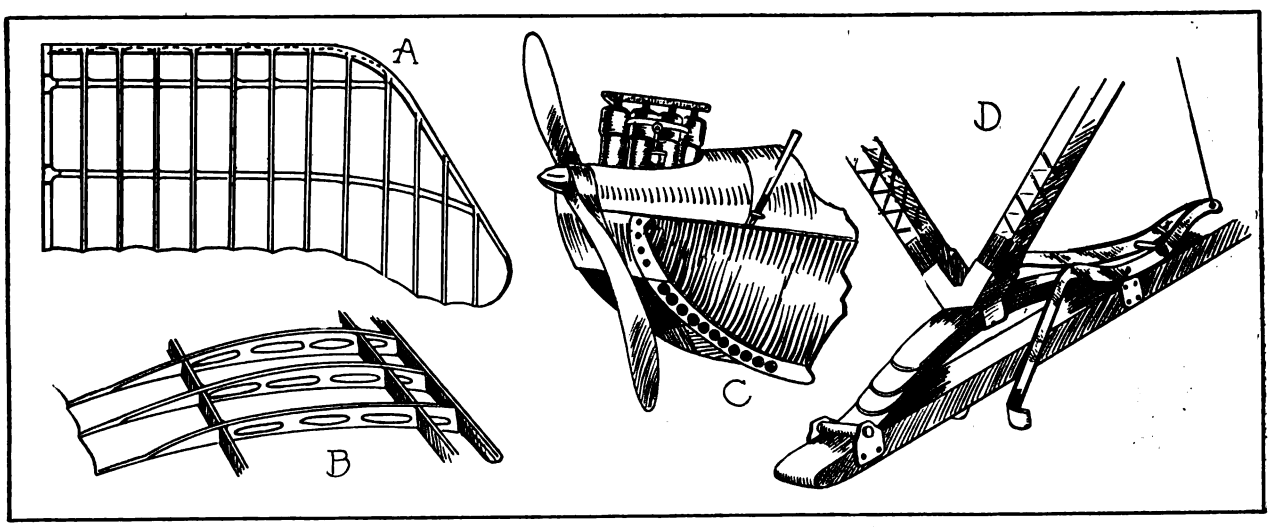
At the rear end of the fuselage is the non-lifting triangular fixed tail plane, with the unbalanced elevator behind it, still further accentuating the bird-like appearance. Above the tail plane is the triangular balanced rudder. This empennage is protected from landing shocks by a stout curved ash skid, fitted with rubber shock absorbing rings.

The chassis is particularly sound and strong. The struts which carry the skids, on which the wheels are mounted after the plan inaugurated by Henri Farman, are not rigidly connected to the skids, but are

Digitized by Google

Plan View and Elevation of Albatross Monoplane, Showing Detailed Dimensions and Principal Features of Design.

Digitized by Google



taken to a short laminated spring, thus effectually taking up all direct shock. In addition, it will be noted that each skid is strutted independently of the other, and each is fitted with a landing brake, operated by a separate column.

The slanting struts from the body taper from 2.5 by one inch down to 1.25 inches diameter at the round clip skid fastening. They are bound with 1.5-inch wide linen tape in two layers, these being wound in opposite directions, thus preventing the wood from splitting. The vertical struts are similarly bound and are fitted into steel boxes two by one inch, with a rectangular horizontal slot through the base, .5 inch deep. This takes a four-layer leaf spring, two inches wide, the three lower layers being of 10 gauge and the top of 14 gauge. The end of the front lowest leaf clips around a .3125-inch bolt held at either side of the skid by a 12 gauge steel plate. The other end slides under the clip holding the .625-inch radius rods. The brake is fitted on each skid just in front of the rear struts, and pivots on the .375-inch bolt around which is clipped the front edge of the back springs.

Two seats are provided, and these are arranged tandem. A particular feature is the double control system. The two sets are interlocked, this being accomplished by one universally jointed tube. Elevation and stability are controlled by a rotatable hand wheel mounted at the top of a vertical column. The rudder is operated by pedal.

Lateral control is by warping the wing tips. A vertical pillar one inch in diameter carries the steering wheel, back of which is a seven-inch drum with a .375-inch square groove. The warping cable passes twice around this, and twice around a subsidiary jockey pulley fixed at one side of the vertical column, about six inches above the horizontal 1.125-inch tube into which this pillar is fitted. Two more pulleys are disposed on the main plane before leading to the masts above the flexible wing tips. Two eyes bolted to the longitudinal members of the horizontal tube carry the vertical levers which take the elevator control wires.

The motor is a four-cylinder, water-cooled Argus, rated at 100 horsepower at 1200 revolutions a minute. Ignition is supplied by a Bosch magneto. Directly coupled to the engine is a Chauviere propeller nine feet 10 inches in diameter. The rated speed of the machine is 55 miles an hour.

Some Detailed Features of Albatross Monoplane: A and B, Method of Constructing Wings; C, Propeller, Engine and Radiator Mounting; D, Laminated Spring on Chassis Skid and Landing Brake.

NEW CLUB IN NEWTON, MASS.

The first step toward the organization of an automobile club in Newton, Mass., was taken March 29, when President L. R. Speare of the Massachusetts State Automobile Association addressed the motorists in the rooms of the Newton Club, Newtonville. Forty names were placed on the membership list and the following officers elected: President, Mayor Charles E. Hatfield; vice president, E. Ray Speare; secretary-treasurer, G. A. Strachan; directors, Samuel W. French, Mitchell Wing, Jarvis Lamson, George W. Nash. Herbert D. Forbes will represent the club in the American Automobile Association and George W. MacNear in the state organization.

CARTERCAR'S BOSTON BRANCH.

The fast growing popularity of the Cartercar, made by the Cartercar Company, Pontiac, Mich., in Boston and vicinity has made it necessary to secure a more favorable location, and it is now on display under the agency of Williams & Co., at 998-1000 Boylston street. The friction driven Cartercar has been represented in the East only a short time, but its splendid success during the recent Boston show would seem to indicate that it is to receive the same cordial reception here as has been accorded it for so many years in the West.

MOTORING NEWS OF NATIONAL IMPORT.

John N. Willys Buys Controlling Interest in Gramm Motor Truck Company---Governor Wilson Signs Reciprocity Bill in New Jersey---New York Acts on Cut-Out Abolition---Minor Show Circuit Is Still Busy.

A transaction of importance to the automobile industry is announced in the statement that John N. Willys, president and sole owner of the Willys-Overland Company, maker of Overland cars, and allied interests, has purchased the controlling interest in the Gramm Motor Truck Company, Lima, O. The amount of money involved in the deal has not been made public, but it is understood to have been one of the largest transactions of this character in the history of the motor car.

John N. Willys, President Willys-Overland Company.

It has been known for some time that Mr. Willys was casting about for a truck plant which was equipped as he thought it should be to meet the requirements and demands of the commercial car users of America, and particularly with reference to the business arrangements of the more than 2000 Overland dealers throughout the country. The selection of the Gramm plant appears to be in keeping with this desire.

Mr. Willys' success in building up the production of Overland cars since he became identified with that company, is ample assurance that the future of the Gramm truck will be along liberal lines. It is understood there will be no change in the policy of the concern, except in the matter of broader production facilities, and in line with this suggestion, B. A. Gramm, one of the most experienced commercial vehicle manufacturers in the country, will be associated with Mr. Willys in working out the problem.

The Gramm plant is said to be the largest truck factory in the world, devoted exclusively to the manufacture of industrial transports. The buildings are located on 22 acres of ground, and 1200 men are employed. All of the equipment is of the very latest and best to be had, and the automatic machinery is the most modern in design. The buildings are of steel and reinforced concrete, and are valued at $1,250,000.

RECIPROCITY WINS IN JERSEY.

After Five Years of Exclusion Motorists Will Be Exempt Fifteen Days a Year.

Governor Wilson of New Jersey signed the so-called Stickel automobile reciprocity bill, April 2, and in the future non-resident motorists will be permitted to operate their cars in that state for 15 days in any one calendar year without paying for the privilege. The bill experienced a stormy time in the senate during the last few days, being defeated once by a vote of 10 to eight. March 27, it was reconsidered and passed by a vote of 11 to nine. The bill takes effect immediately.

This is the result of a campaign which has been waged against the discriminating Jersey law for the past five years, and is a decided victory for organized motorists. One feature of the new statute is not particularly attractive to resident motorists, since by its terms the registration fee is increased 50 per cent. This action was taken in order to arrange for the deficit which is expected to materialize as a result of the abolition of the special touring licenses, which non-resident motorists have had to procure in the past. The vital section reads as follows:

"Any motor vehicle belonging to any person who is a non-resident of this state and who has registered such motor vehicle and has complied with all the laws of the state, territory or federal district of the United States in which he resides with respect to the registration of motor vehicles and the display of registration numbers and who shall conspicuously display such registration number as required thereby, may be driven in this state during a period of not to exceed 15 days in each calendar year or on two or more occasions not exceeding in the aggregate the period of 15 days in any such year, without complying with or being subject to the provisions of sections 15 or 21 of the act to which this is a supplement or either of them, or with any of the preceding sections of this supplement; provided that each day or part of a day during which any such motor vehicle is within this state shall be considered as one of said 15 days; and provided further, that the provisions of this section shall be operative as to any such motor vehicle owned

Digitized by Google

by non-residents of this state only to the extent that under the laws of the state, territory or federal district of his residence substantially similar exemptions and privileges are granted to motor vehicles duly registered under the laws of this state."

NEW YORK CITY BARS CUT-OUT.

Board of Aldermen Follows Example Recently Set by London County Council.

Following the example set by the city of London, the board of aldermen in New York City has unanimously passed a resolution prohibiting the use of the muffler cut-out in that city. This action was taken following a hearing granted to all parties interested, in which the Touring Club of America strongly advocated the passage of the ordinance, which becomes effective 90 days after signed by the mayor, and reads as follows:

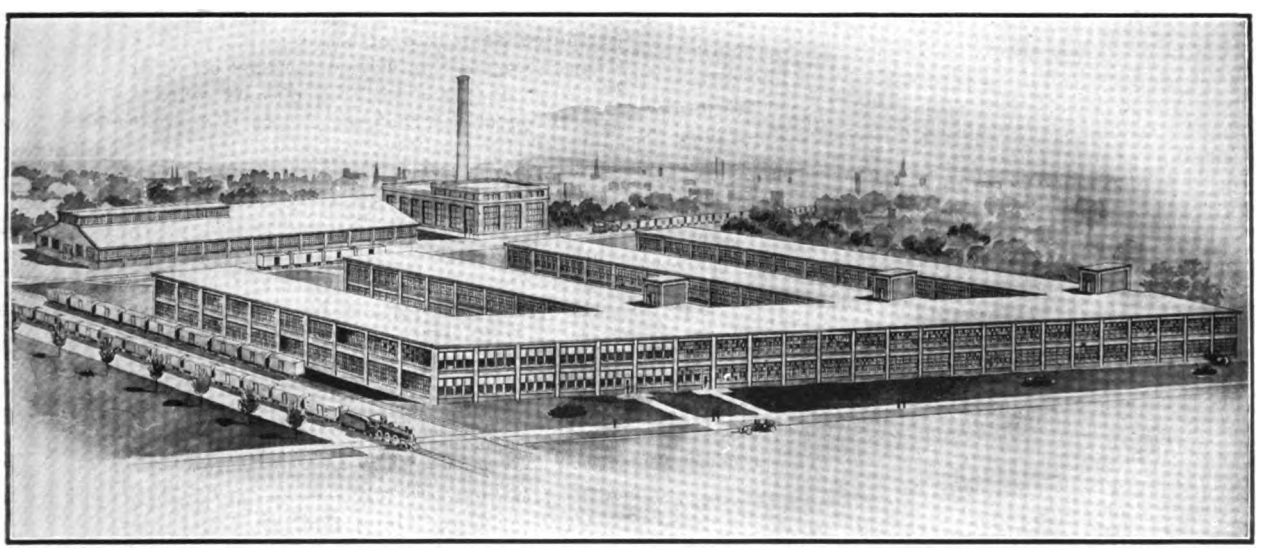
"Every motor vehicle propelled by an internal combustion engine when such vehicle is on any street, road, avenue, alley, park, parkway or public place within the city limits shall when such engine is running be equipped with a muffler or silencer, through which all of the exhaust gases from the engine will escape into the atmosphere.

"It shall be unlawful for the operator or driver of any motor vehicle to use any cut-out, fitting or other appliance or a device which will allow the exhaust gases to escape into the atmosphere without a suitable muffler or silencer, as described in section 1.

"Any person violating the provision of this ordinance may upon conviction thereof by any city magistrate be fined a sum not exceeding $10, and in default of payment of such fine may be committed to prison by such city magistrate until the same be paid, but such imprisonment shall not exceed 10 days."

WOULD OPEN YELLOWSTONE.

Western States Join American Automobile Association in Petitioning Congress.



Motorists throughout the country are much interested in the effort to interest Congress in the proposition to open Yellowstone national park and other public preserves to automobile traffic. It appears that they are receiving valuable assistance from the boards of trade and other similar associations in the West, particularly in Utah, Wyoming, Montana and Idaho. These bodies have notified the American Automobile Association of their intention to do all in their power to bring about favorable action, and a decided public opinion has been aroused in consequence. The following is a copy of the resolutions from Salt Lake City:

"Whereas, the neighboring states of Idaho, Montana and Wyoming, through their commercial organizations, are now working for, and in some instances have requested, the opening of the Yellowstone national park to automobiles; and

"Whereas, the same request has been made by the American Automobile Association, an organization of thousands of American citizens residing all over the country, proving the desire is not local but general; and

"Whereas, the Yellowstone park can be seen with less expense, more comfort and less loss of time from an automobile than in any other manner; and

"Whereas, the park belongs to all the people, is kept open and maintained by the people, for all the people; and

Plant of the Gramm Motor Truck Company, Lima, O., the Controlling Interest in Which Was Acquired by John N. Willys, Recently.

Digitized by Google

"Whereas, the opening of the park to automobiles would induce thousands of our citizens to 'See America First', by coming west instead of annually going abroad where the countries of Europe give automobiles free access to all points of interest, thereby enriching themselves by millions of American dollars every year; therefore, be it

"Resolved, that we hereby request Utah representatives in Congress to urge upon the proper authorities of the national government to take such steps as are necessary to at once give automobile access to the Yellowstone national park."

WATERBURY'S FIRST SHOW.

Naugatuck Valley Sees Thirty Different Makes of Pleasure and Commercial Cars.

The first organized showing of automobiles in Waterbury, Conn., was held in the Auditorium, March 27-30, under the direction of Frank Copithorn and John M. Sweeney. Flags, bunting and flowers were used in the decorations, and potted plants set off the various exhibits. It was a thoroughly representative showing of cars, and the business transacted was quite in keeping with the importance of the undertaking, many people in the towns throughout the Naugatuck valley taking advantage of the opportunity to examine and make selection from the season's models.

Thirty different makes of machines, represented by 50 pleasure cars and trucks, were on display. Several sales were announced during the opening evening and this example was followed throughout the remainder of the exhibition. The success of the venture was such as to indicate that the Waterbury show will be an annual feature.

Exhibitors of pleasure cars were as follows: Taber & Humprey, Reo; Waterbury Automobile Company, Overland; Blue Ribbon Garage, Packard; Field's Garage, Ford, Cadillac; Erwin M. Jennings Company, Alco, American, Stevens-Duryea, Hudson; B. W. Johnson, Brush; G. Irving Lake, Moon; Maltby Garage, Buick, Oldsmobile; E. H. Towle Company, Maxwell, Franklin, Locomobile, Columbia-Knight; Bristol Auto Company, De Tamble; Miner Garage, Pierce-Arrow; Turrell Garage, Rambler; State Garage, Regal, Abbott-Detroit; Boulevard Garage, E-M-F, Flanders; Saxe & Floto, Everitt; Jefferson Garage, R-C-H, Jackson.

Commercial vehicles were shown by: Maltby Garage, G. M. C.; Blue Ribbon Garage, Packard; Erwin M. Jennings Company, Lippard-Stewart.

Other exhibits included: Brass City Cycle Works, Merkel motorcycles; J. B. Ells, Pope motorcycles; A. B. Bentley, supplies; Waterbury Welding Company, welding; Carroll & O'Brien, accessories; Todd Rubber Company, Kelly-Springfield tires; Apothecaries Hall Company, supplies; Standard Engineering Company, fittings; Judd & Puffer, insurance.

BUSINESS AT MANCHESTER.

New Hampshire Citizens Visit Annual Display Prepared to Purchase Machines.

Strictly in keeping with the business possibilities demonstrated in other sections of the country, the second annual automobile show of the dealers in Manchester, N. H., March 25-30, started early with the sale of a Ford car. Other sales followed in quick succession, and the report of the exhibition may be summed up largely in the statement that it was the best show for business that has been held in northern New England. The management was in charge of J. H. Graham of Old Orchard, Me.

The event was staged in Mechanics Hall, which was completely transformed by a liberal use of bunting. The ceiling was hidden by a delicate pink and white, while the side walls were trimmed with red and white, rosettes of red, white and blue being distributed at points of vantage around the hall. The various exhibition spaces were set off by potted plants.

Among the exhibitors of cars were: A. C. Pollard, Stevens-Duryea, Chalmers, Modern truck; Howard Lamphrey, Firestone-Columbus, Stearns-Knight; Stewart & Fletcher, Elmore; Red Arrow Garage, Cadillac; Brodie Electric & Auto Company, Speedwell, Everitt, Ford; W. G. Spear, Hudson; Grout Automobile Company, Grout; E. Ray Shaw, Bergdoll; Concord Auto Sales Company, Cole; Georgi & Smith, Maxwell; C. R. Sawyer Company, Reo; Frank N. Young, Oakland; New Hampshire Auto Company, Knox, Velie, E-M-F, Flanders, Franklin; Smith & Ramsey, Overland.

WATERTOWN'S EXHIBITION.

Weather Conditions Fail to Discourage Visitors at Third Annual Event.

Despite the very poor weather conditions, the third annual show of the dealers in Watertown, N. Y., in the armory drill shed, March 26-30, exceeded in attendance any display of this nature held in this section of the state. The event was under the direction of President L. G. DeCant and Secretary Arthur E. Sherwood of the Watertown Automobile Association, and was a success from every viewpoint. In number of sales, it exceeded even the fondest expectations.

The interior of the hall was decorated with white and yellow bunting, and made an attractive picture when the thousands of electric lights were turned on. More than 50 cars, six makes of motorcycles and a large number of accessories made up the display. The list of exhibitors follows:

Cars—H. H. Babcock Company, Babcock electric; Watertown Automobile & Supply Company, Overland, Oakland, Mitchell; C. R. Wise, Cole, American; Gould Automobile Company, Buick; Edwards Automobile

Digitized by Google

Company, Stoddard-Dayton-Knight, Maxwell, Columbia-Knight; Leon Quick, K-R-I-T, Cadillac; Nellis & Smith, Reo; Frank L. Massey, Marathon; Warner Automobile Company, Ford; A. E. Christopher, Hudson; W. P. Smith, E-M-F, Flanders; George H. Baltz, Hupmobile, R-C-H, Jackson.

Motorcycles—C. O. McCarty, Emblem; Thomas H. Merritt, Harley-Davidson; Bents, Bushnell & Co., Pope, R-S; Syracuse Rubber Company, Indian; Barter & Co., Excelsior.

Accessories—F. A. Empsall & Co., gloves; J. C. Perrault, tops; G. C. Martin, Kelly-Springfield tires; E. Q. Williams, ignition equipment; C. R. Eggleston, oil tanks and pumps; Andrew Bolger, lighting equipment; Syracuse Rubber Company, rubber goods; Utica Auto Supply Company, full line; Syracuse Auto Supply Company, general line; Leon Enos, storage systems; Standard Oil Company, Polarine oils.

BELFAST JOINS SHOW CIRCUIT.

Opportunity Afforded for Those Unable to Witness Displays in Larger Cities.

Although affording but limited space, the Read garage in Belfast, Me., was utilized by the dealers in that city for their first annual automobile show, March 27-30. It proved an admirable opportunity for those who had been unable to visit the Bangor, Portland or Boston displays to examine the season's models, and numerous sales are expected to result.

The list of exhibitors was not large, but practically all of the makes represented in Belfast were on display as follows: Read Garage, Haynes, Mitchell, White, White truck; Carle & Jones, Ford; C. L. Wilband, Metz; S. A. Parker, International wagon; W. H. Hall, National; S. M. R. Locke, Maxwell; C. E. Read, Overland.

ANNUAL DISPLAY AT LEWISTON

Auburn, Me., Assists Sister City in Presenting Season's Models for Inspection.

The second annual show in Lewiston and Auburn, Me., was held in Auburn Hall, April 4-6, the management being under the direction of J. H. Graham of Old Orchard, Me., as was the case last year. The decorative scheme was simple and effective, and the number of cars on display was large augmented by a number from Boston, represented by the agencies in that city.

Local exhibitors were: Fred L. Blinn, Case; Webber & Webber, Elmore; J. F. True & Co., Metz; Nelke & Partridge, Nyberg, Winton; J. H. Stetson & Co., Stutz, Stoddard-Dayton-Knight; Jonas Edwards & Son, Buick, Oakland; R. S. Whitney, Paige-Detroit; Darling Auto Company, Reo, Maxwell; Auburn Garage Company, Penn, Marmon; Brown & Bosworth, accessories; Standard Oil Company, Polarine oils.

Cars which were shown by Boston agents included: Pathfinder, Grout, Marion, Speedwell, Mora, Firestone-Columbus, Stanley steamer, Velie, Cutting and Teel-Woodworth truck. The following accessories also were shown by Boston houses: Eagleine No-Karbon oil, Vacuum oil, Federal, Goodrich, Diamond and Imperial tires.

EXHIBIT IN NEW BEDFORD.

Local Dealers and Boston Agents Join Forces in Making the Event a Success.

About 30 different makes of cars were represented at the first automobile show held in New Bedford, Mass., March 27-April 2, under the direction of O. G. Corbett of New York City. The event was staged in Elm Rink, which was liberally decorated with bunting and potted plants for the occasion. Several exhibits were brought over the road direct from Boston, and the people of New Bedford and vicinity gave every evidence of being well pleased with the showing made. Several sales were reported.

Included among the exhibitors were the following: William H. Bassett Company, Lenox; S. C. Lowe Supply Company, Chalmers; Wm. G. Robert & Son, Michigan; Bristol County Auto Company, Abbott-Detroit, K-R-I-T, Austin, Auburn, Cutting; Bert A. Vance, Cole; A. L. Bradley, Overland; Central Garage, American, Oakland, White. Guy Murdock, E-M-F, Flanders; Borden Service Station, Maxwell; F. H. Betmore, R-C-H; W. H. Stevens, National; Roy Wells, Penn; Watuppa Auto Company, Crawford.

FOR HIGHWAY IMPROVEMENT.

Good Roads Organizations Throughout the Country Assemble in Washington, D. C.

A hearing on the joint resolution of Congress for the appointment of an investigating committee to consider federal participation in good roads construction at Washington, Began April 10. Of the members of the rules committee, before which the hearing takes place, several have announced themselves as favorable to the proposition, which is receiving the hearty endorsement of the American Automobile Associaton.

Among the co-operating good roads bodies which are expected to be represented at the hearing are the following: National Grange, Farmers' Union, American Road Builders' Association, Ohio Good Roads Federation, Alabama Good Roads Association, Indiana Good Roads Association, Michigan State Good Roads Association, Florida Good Roads Association, Illinois Association for Highway Improvement, Missouri Old Trails Association, New Santa Fe Trail Association, North Carolina Good Roads Association, Southern Appalachian Good Roads Association.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Selecting Convention Seat.

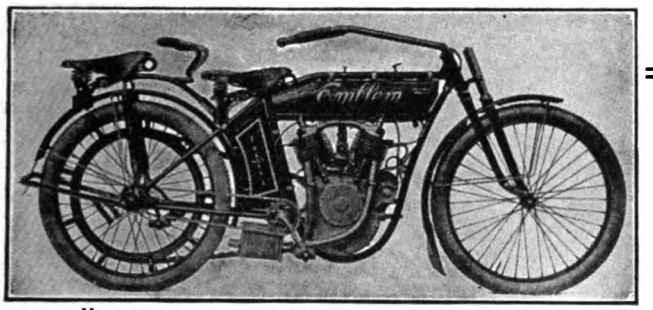
Thus far no less than five cities have announced their intention of securing the honor of holding the annual national assembly of the Federation of American Motorcyclists. The list includes Columbus, Cleveland, Chicago, Indianapolis and Detroit. All are centrally located, and each has some special reason why it should be selected. It would appear that decision will be made in the near future, in view of the following official announcement to those interested issued by President G. H. Hamilton of the federation:

"According to the constitution and bylaws of the F. A. M., not more than 90 nor less than 60 days' notice of the annual meeting must be given in the motorcycle papers, and in order to comply with these provisions it is necessary that all cities desiring to bid for the 1912 F. A. M. meet should be notified relative to the time that applications shall be received.

Scene on the Los Angeles Stadium During a Recent Race Meet.

"This notice is to the effect that all applications for the 1912 meet to be acted upon by the board of directors of the F. A. M. must be filed with the president prior to April 25, 1912.

"In making applications it is requested that the dates on which the meet is to be given, also a complete programme of the entertainment to be offered, together with the names of the hotels and rates of each, be furnished."



Dr. Thornley's Prize Money.

Several years ago there was considerable trouble about the collecting of prizes won in contests, and so many well founded claims of fraud were brought to the attention of the chairman of the competition committee of the Federation of American Motorcyclists, that Dr. J. P. Thornley, who then held and still holds this position, established a prize fund for the benefit of riders, so that they would be quite sure they would get what was promised them on the entry blanks and programmes. This scheme worked out as follows:

If after a promoter had published an entry blank giving the cash value of the prizes, the rider was not satisfied that the prize was of the same value as stated thereon, he could insist that the money be sent to Dr. Thornley, where it would be credited to his prize account in that office. Since that time Dr. Thornley has handled a great deal of money for the riders. They have been allowed to buy prizes with this money whenever they chose. All that was asked was that the bill be sent to him, and a check was mailed immediately to the dealer without question. Dr. Thornley now asks that the motorcycling publications assist him in cleaning up his accounts for the year, so that he can begin anew for the coming season.

He holds money for riders as follows: J. U. Constant, $85; Walter Goerke, $2.67; William Kreiger, $5, W. J. Tuebner, $29.25; William Major, $5; C. H. Thompson, Jr., $5; Epstein, $2; Thomas Rice, $2; Frank Hart, three cents; H. Klebes, $3; H. W. G.

EMBLEM STURDINESS IS AN INTERNATIONALLY KNOWN FACT

Here's Another Sample of the Sort of Letters We Receive Every Day:

"In March last I bought one of your 5 H. P. Emblem Motorcycles for use in my work as manager of the Gowanda District of the Federal Telephone and Telegraph Company. This territory covers the hills of Cataraugus and Chatauqua counties and between March and October I covered some 6,500 miles. The machine carries me where it would be impossible to make any time with an auto as the roads are hilly and rough but I have not had the slightest trouble getting over them, my only outlay aside from regular wear of parts such as tires, etc., being 40 cents for a spring to hold the stand up. I heartily recommend the Emblem for Reliability and Standupness, especially for the hard work done in the telephone business.

Signed L. W. SHIPMAN, Gowanda, N. Y."

Cox, $20, making a total of $158.95. He also holds for delivery, subject to demand of the owners, three bronze medals, one won by F. Fredericks and two by George Haas. Concerning these sums, Dr. Thornley says:

"These men must one and all immediately buy prizes with this money sending me the bill for whatever they want, whereupon, it will be paid at once. If by the 15th of next month (April), there are any names left on the list who haven't bought their prizes, I shall proceed to buy prizes for them and forward the same to them at once. In the case of Frank Hart, who has only three cents, I don't know what I can send him, unless it is a handsome steel engraving of George Washington on a postage stamp."

Los Angeles Track Abandoned.

According to the latest information from Los Angeles, it would appear that the racing season was over. The Indian machines were withdrawn after a spirited discussion at the track. Other riders have refused to take part in future events, and have gone to other cities. Dr. Thornley of the F. A. M. competition committee says there always has been a lot of trouble since racing was first begun in California and he doesn't know what can be done to straighten things out. Everybody seems to have been to blame in a measure. Those who have attempted to referee the contests have found it a decidedly unpleasant task. It seems too bad, but if the information at hand be true, the Los Angeles stadium appears to be abandoned, at least until some different arrangement can be made.

New Members for March.

Six hundred and twenty-five new members were added to the rolls of the Federation of American Motorcyclists during March, according to the figures announced by Secretary-Treasurer G. B. Gibson of Westboro, Mass. Divided as to districts, the following results are obtained: Atlantic, 169; Lake, 133; Southwestern, 97; Central, 68; New England, 56; Peninsular, 35; Pacific, 34; Gulf, 29; Canadian, four.

Classified according to states, the result is as follows: California, 94; New York, 66; Pennsylvania, 55; Massachusetts, 48; Kansas, 41; Ohio, 38; Michigan, 32; Indiana, 30; Illinois, 28; New Jersey, 27; Washington, 27; Texas, 25; Georgia, 14; Minnesota, 14;

District of Columbia, 13; Florida, nine; Connecticut, Maryland and Iowa, six each; Alabama, Nebraska, West Virginia and Oregon, five each; Tennessee and

Joseph Wolters, the Champion Excelsior Rider and His Racing Mount.

Canada, four each; Wisconsin, three; Rhode Island, North Carolina, Missouri, Kentucky and Colorado, two each; Mississippi, Louisiana, Arkansas, South Dakota, North Dakota, Montana, Idaho and Nevada, one each.

New Records at Los Angeles.

Before the final curtain was drawn on the races at the Los Angeles stadium, two more new records were made March 25. Balke on an Excelsior cut the time for three miles from 2:01.6 to 2:00.6, and Graves on another Excelsior rode seven miles in 4:47.2 as against De Rosier's mark of 4:54, also made on an Excelsior, Feb. 7. The summary of the meet follows:

Five miles, amateurs—First, Montgomery, Excelsior. Position awarded by referee after machines had been broken in collision. No time taken.

Four miles, class B, professionals—First, T. Samuelson, Excelsior; second, Humiston, Indian; third, Kittle, Indian; time, 3:05.4.

Three miles, Class A, professionals—First, Balke, Excelsior; second, Graves, Excelsior; third, Wolters, Excelsior; time, 2:00.6.

Three miles, class B, professionals—First, Peck, Excelsior; second, T. Samuelson, Excelsior; third, Albright, Indian; time, 2:05.

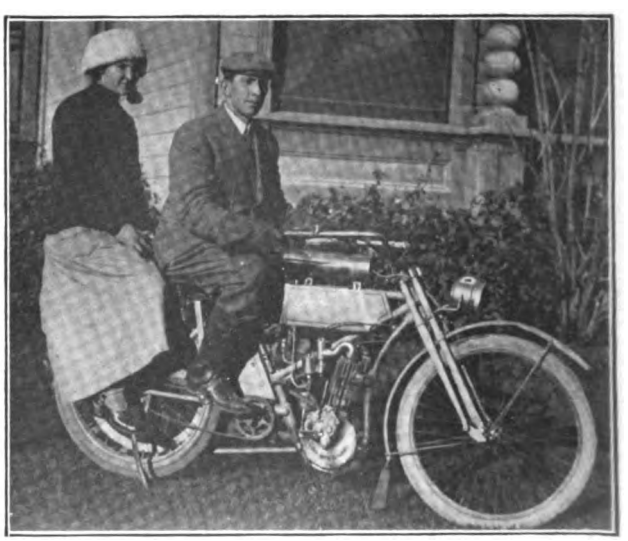
Three miles, class A, professionals—First, Graves, Excelsior; second, Balke, Excelsior; third, Wolters, Excelsior; time, 2:01.

Four miles, class A, professionals—First, Balke, Excelsior; second, Graves, Excelsior; third, Wolters, Excelsior; time, 2:43.4.

Seven miles, free-for-all—First, Graves, Excelsior; second, Balke, Excelsior; third, Wolters, Excelsior; time, 4:47.2.

Five miles, class B, professionals—First, Humiston, Indian; second, Kittle, Indian; time, 3:56.4.

Two miles, invitation—First, Peck, Excelsior; second, Kittle, Indian; time, 1:35.6.



Providence Motorcyclists' Home.

The new Swenson building, which B. A. Swenson, the Indian agent in Providence, R. I., is constructing at Blackstone and Broad streets in that city, will be completed about May 1, and the Providence Motorcycle Club, which has engaged quarters therein, is planning a big house warming soon after that date. The new club rooms are to be known as the Motorcyclists' Home, and visiting riders, when in Providence, are invited to call around and see how well this club carries out the name in every appointment. Besides the regular meeting room and a room for social festivities, a thoroughly equipped repair shop will be maintained.

Recent Affiliations.

In the spring, when the thoughts of the motorcyclists turn to long distance tours, club runs and contests of all sorts the work of E. M. Estabrook, chairman of the F. A. M. membership committee, becomes even more burdensome. The list of affiliations is beginning to show the result of the labor expended by Chairman Estabrook during the winter season. Recent additions are as follows:

Washington Motorcycle Club, Washington, D. C., 232; G. C. Billard, secretary, 736 14th street, N.W., 14 members. Plainfield Motorcycle Club, Plainfield, N. J., 234; W. De W. Miller, secretary, 33 Somerset street, 17 members. St. Cloud Motorcycle Club, St. Cloud, Minn., 235; H. E. Scharenbroich, secretary, 617 Third avenue, South, 15 members. Columbus Motorcycle Club, Columbus, Ga., 236; J. B. McCullom, secretary, 13th street and First avenue, 12 members.

Mr. and Mrs. W. D. Price of Los Angeles, Cal., on Their Wagner Mount.

Motor Club of Modesto, Cal., 237; J. J. O'Keefe, secretary, care Fire Department, 35 members. Lemoore Motorcycle Club, Lemoore, Cal., 238; C. R. Fox, sec-

Digitized by Google

retary, care Clifford Cyclery, 14 members. Muskegon Motorcycle Club, Muskegon, Mich., 239; F. A. Meeker, secretary, Heights street, 20 members.

The Queen City Motorcycle Club, Cincinnati, O., which bears the fated No. 13, has decided to try again, and this number has been reissued to it. Clarence Rossiter of 2272 Adams avenue, is secretary.

A Club of Boosters.

The Will County Motorcycle Club, Joliet, Ill., is composed entirely of boosters, by which is meant that there is nothing which comes to the attention of these members which will aid the cause of the F. A. M. and the great body of riders which the federation represents, in which they do not take a decidedly active part. In addition, the club finds time to take up much effective local work. Recently, it has been issuing a circular to all operators of motor vehicles and the public generally, which bears the heading, "Obey the Law of the Road," and reads as follows:

"Walking or driving, pass to the right of those coming toward you. Turn to your right, let those behind you pass to your left. Never turn to the left before looking to see if some one desires to pass. Let the one behind pass to your left. Turn corners slow, don't sprawl all over the street.

"In walking, cross a street on the cross walks. Don't stand on road or street crossings to visit or transact business. Before you cross a street, look to the right, left and ahead. The lack of a few seconds' hesitation may mean a life or a cripple. A street car, motor vehicle, horse and buggy, bicycle or perhaps the fire department or a runaway may be coming down the street. Be safe.

"All vehicles when stopping on street must do so with right side to curb. Watch out. Neither yourself or let others throw nails, bottles or wire in the roads.

"These are the laws, made for the benefit of you and us. Do your duty and few accidents will happen."

This sounds like good, wholesome advice, and the campaign certainly ought to be productive of much good, among all classes of highway users.

Club Organizers.

The following men are interested in the organization of affiliated clubs in their respective districts and are entitled to all the aid and encouragement that riders in these sections can give them: R. Walker, 132 Manor road, West Brighton, Staten Island, N. Y.; William J. Rehrig, 47 East Main street, Somerville, Mass.; Hans F. Neil, 208 Taylor street, Findlay, O.; C. C. Vaughn, Brunswick, Ga.; M. A. Kilpatrick, Stamford, Tex.; Herbert L. Fisher, Beardsley, Minn.; William Maresh, 212-214 Washington street, Iowa City, Ia.; L. W. Conly, Herkimer, N. Y.; Edwin A. Hall, 76 Main street, Dansville, N. Y.; Samuel A. Hemm, 2520 North Broad street, Philadelphia, Penn.; Garwood Storer, Bedford, Ind.; William Demler, 18 Kennedy street, Bradford, Penn.; Stuart Tracy, Graves, Cox & Co., Gulfport, Miss.; G. F. Hodgman, 14 School street, Concord, N. H.; C. D. Bremer, 538 Muskego avenue, Milwaukee, Wis.; E. S. Henderson,

Lee Humiston, Who Has Been Doing Good Work on the Pacific Coast with an Indian.

153 Thatcher street, Hornell, N. Y.; John Wolf, lock box 754, Sparta, Wis.; J. Lem Titworth, Wolfe City, Tex.; William H. Houts, Aneheim, Cal.; Louis W. Burkhardt, West Palen Beach, Fla.

New Club in Maryland.

A number of riders in Orangeville, Md., and vicinity met recently and organized the Orangeville Motorcycle Club, which has elected the following officers: Captain, Porter C. Bond; first lieutenant, George Hoffenberger; second lieutenant, William Gambrill; color bearer, Albert Lehmann; tour master, Joseph Hartley. For the present all unattached riders in the vicinity will be invited to accompany the club on its Sunday

runs, the idea being to show these what good times are planned by the new organization.

Rides with One Arm.

Ernest Sonnenberg of Gaylord, Kan., is an enthusiastic motorcylist although he has been deprived entirely of the use of his right arm. An accompanying illustration shows him with the fourth Emblem mount, made by the Emblem Manufacturing Company, Angola, N. Y., which he has owned and ridden with success.

Mr. Sonnenberg writes that he experiences no trouble whatever in riding through sand and overcoming many obstacles which bother riders possessed of both arms. The machine is a regular stock model, the

Ernest Sonnenberg of Gaylord, Kan., and the Fourth Emblem He Has Owned.

only change being the fitting of all controls to the left handlebar.

Club Notes, Here and There.

The Topeka Motorcycle Club, Topeka, Kan., is considering the proposition of building a three-lap track at Garfield Park.

A series of races will be held in Milwaukee, Wis., early in June, under the auspices of the Wisconsin Motorcycle Club of that city.

The Kings County Motorcycle Club, Hanford, Cal., promises to increase its membership to 100 during the coming season.

The Motorcycle Touring Club of Chicago has elected the following officers for the ensuing year: President, M. Stuhlfaut; vice president, Norman Bach; recording secretary, A. Born; financial secretary, C. R. Schwartz; sergeant-at-arms, William Reder; captain, John Herman; first lieutenant, B. Stechbart; second lieutenant, E. Born.

At the recent annual meeting of the Louisville Motorcycle Club, Louisville, Ky., all the offices were filled by new men, who have never before held official position in the organization, as follows: President, C. R. Gilmore; vice president, P. J. Kuhn; secretary-treasurer, P. H. Kline; directors, Frank Marshall and R. J. Buxe.

The Wichita Motorcycle Club, Wichita, Kan., has voted an honorary membership to Motorcycle Patrolman C. M. Tucker.

The Boston Motorcycle Club, Boston Mass., will hold its first official run for 1912 on Patriots Day, April 19, following a custom that has been in vogue among the riders in that city since the days of the bicycle. Present plans indicate that the objective point will be the Dead Horse hill course in Leicester, just beyond Worcester.

A new club has been organized at Lexington, Ky., which will be known as the Bluegrass Motorcycle Club.

The Poughkeepsie Motorcycle Club, Poughkeepsie, N. Y., is composed of a lot of hungry riders, judging from the fact that it held its annual banquet April 1, and followed this by a chicken dinner run, April 7.

Following the annual banquet of the Binghamton Motorcycle Club, Binghamton, N. Y., March 25, the election of officers resulted as follows: President, Walter J. Lyon; vice president, W. Hemstraught; secretary, E. Sirowatke; treasurer, C. F. Goetchens; captain, B. C. Race; first lieutenant. G. Bracio; second lieutenant, Lester Rugg; delegate to the national assembly of the F. A. M., Robert Morris.

The annual smoker of the Rhode Island Motorcycle Club, Providence, R. I., will be held in Palestine hall, 266 Weybosset street, that city, April 17.

Board Track in Detroit.

Jack Prince, the well known motorcycle track builder, has been busy in Detroit during the past month, and has decided to construct a half-mile board track in that city. This will have banks of 60 degrees and it is anticipated it will be able to make 100 miles an hour on it without difficulty; that is supposing a machine can be found to travel that fast.

Indian Maiden Rides Motorcycle.

According to the Galveston News, Galveston, Tex., Minnie Skey Eagle, a full blooded Pawnee Indian maiden, has purchased a motorcycle, with which she makes long trips from the government reservation at Geronimo, Okla., to Bliss Olla ranch 101. She says the new steed is much more to her liking than the Indian ponies of her forefathers.

Handsome Wall Souvenir.

The Emblem Manufacturing Company, Angola, N. Y., maker of Emblem machines, is sending to the trade a handsomely framed picture of its factory, suitable for display on the walls of the salesroom.

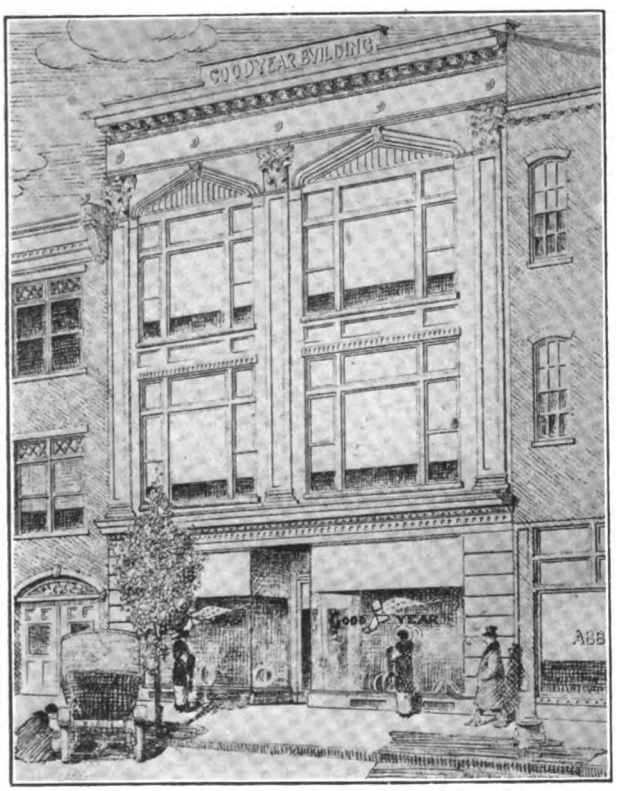
S. J. Wise & Co., New York City, has opened a branch house at Boylston and Fairfield streets, Boston, where a full line of the King car, made by the King Motor Car Company, Detroit, will be carried.



Albert Bale, Hinckley, Ill., has been appointed agent for the Velie line, made by the Velie Motor Vehicle Company, Moline, Ill. He will maintain a service department. His territory includes De Kalb, Lee, Ogle and Kane counties.

William B. Kershaw, 44 Hicks street, Pawtucket, R. I., announces that he is prepared to handle all kinds of repairs to automobiles tires and inner tubes.

The Kokomo Auto & Machine Company, Cole agent at Kokomo, Ind., will be known as C. F. Seward & Son hereafter.

Mueller Bros., Pittsburg, Penn., representative for the Alco line, has taken over the agency of the Haynes car, made by the Haynes Automobile Company, Kokomo, Ind.

The White Automobile Company, Pittsburg, Penn., has broken ground for a new garage and salesroom at the former site of Luna Park. The new building will

New Home of the Philadelphia Branch of the Goodyear Tire & Rubber Company, Which Is Equipped with Modern Conveniences.

be completed in June, will be of concrete and terra cotta, and will cost approximately, $100,000.

The Federal Motor Car Company of Pittsburg, Penn., who until recently represented the Ohio car, made by the Ohio Motor Car Company, Cincinnati, O., has been appointed distributor for western Pennsylvania and northern West Virginia. J. H. McClarren is president and general manager.

J. A. Birch, Placerville, El Dorado county, Cal., is building a modern garage to accommodate the large number of tourists who pass through that place.

The New York Auto Exchange, Norfolk, Va., has taken quarters in the Flatiron building, Grant and Charlotte streets. The concern has the agency for the White car, made by the White Company, Cleveland, O.

Green & Swett, Boston, will open a branch house at Manchester, Mass, having taken a lease of the Wonson building on Central street.

The Des Moines Rambler Company, Des Moines, Ia., was formed recently and will handle the Rambler line, manufactured by the Thomas B. Jeffery Company, Kenosha, Wis.

Perkins & Corliss, Gloucester, Mass., has made arrangements for the erection of a modern brick garage on Western avenue. It will be one story, 40 by 92 feet, and the front will be utilized for a show and salesroom.

Adams Bros., Hickman, Ky., has purchased from Hale & Caruthers, the Hickman Motor Works, which concern conducted a garage and machine shop.

The Waterville Motor Company, Waterville, Me., is occupying its new garage which is of brick, steel and concrete, two stories in height and modern in every respect.

The Burd Auto Company, Waterloo, Ia., moved into its new garage at 420 Seventh street recently. The structure provides 6000 square feet of floor space. New machinery is being installed for a repair shop.

Wilcox Bros., formerly of Chicago, has opened a tire repair shop on Broadway street, Fort Wayne, Ind. The new concern is agent for Fisk tires, made by the Fisk Tire & Rubber Company, Chicopee Falls, Mass.

The Etchells Auto Company, Biddeford, Me., will erect a new garage at Five Points. The building will be one story, 50 by 80 feet, and will contain all modern conveniences. The officers of the company organized recently consist of: President, Arthur L. Roberts; treasurer and manager, Joseph Etchells.

Fred B. Williams has acquired the garage of the Worcester Motor Company, Worcester, Mass., the property consisting of a two-story brick building and 6500 square feet of land.

William S. Mathews and Charles S. Langley have formed a partnership under the firm name of The Mathews & Langley Auto Company and will handle the Abbott-Detroit, made by the Abbott Motor Company, Detroit. The new concern will have as territory, York county, Me.; Strafford county, and Portsmouth and Newmarket in Rockingham county, N. H. Headquarters will be at Somersworth, N. H.

A. L. Alexander, Waterloo, Ia., is planning the erection of a new garage at the corner of Sixth and Franklin streets. It will be two stories, 40 by 80 feet, and will be ready for occupancy in the near future.

Schipper & Block, Peoria, Ill., will build a garage on Fulton street. It will be constructed of fire proof material, two stories in height and will include a fully equipped repair shop.

The Warren Garage Company, Worcester, Mass., has removed to new quarters, having leased the entire building at Vine and Franklin streets.

The C. W. Bowles Automobile Company, Evansville, Ind., is seeking a new location having outgrown its present quarters.

H. N. Stackpole and T. C. Luce, Pittsfield, Mass., have formed the S. & L. Company and will have headquarters at Lowe's garage, 241 South street, where they will conduct a general repair business.

WITH THE MANUFACTURER.

Charles A. Trask has resigned as chief engineer of the Cartercar Company, Pontiac, Mich. He was identified with the company for over five years.

The Abbott Motor Company, Detroit, has appointed the following concerns to handle the Abbott-Detroit: D. B. Hoffer & Sons, Reading, Penn.; The Heathman-Solliday Motor Company, Dayton, O.; John Deere Plow Company, Dallas, Tex.; W. S. Bruce & Co., Memphis, Tenn.; Abbott Motor Sales Company, Toledo, O.

The K-R-I-T Motor Car Company, Detroit, maker of K-R-I-T cars, is occupying the two new buildings added recently to the plant, which is depicted in the accompanying illustration. Another building is in the course of construction, which, when completed, will give the company a capacity for an output four times that of 1911.

The Findeisen & Kropf Manufacturing Company, Chicago, maker of the Rayfield carburetor, is issuing a booklet describing and illustrating a 3200-mile pathfinding trip undertaken in the interests of the Transcontinental Touring Club of America which took the machine equipped with a Rayfield over what will be known as the Panama-Pacific trail or Southwestern route.

The Stephney Tire & Rubber Company, New York City, is issuing a notice calling attention to its product, also quoting prices of tires and inner tubes.

The Goodyear Tire & Rubber Company, Akron, O., announces that its branch at Birmingham, Ala., is occupying its new quarters at 420-422 South 20th street.

Digitized by Google

The new location is in a two-story building, 48 by 90 feet and constructed on the same lines as all of the Goodyear branches.

O. M. Crawford, formerly manager of the advertising and service departments of the Colby Motor Company, Mason City, Ia., is now with the Zenith Carburetor Company, Detroit.

The Goodyear Tire & Rubber Company's Philadelphia branch is occupying its new home at 207-209 North Broad street which was opened to the public recently. In the accompanying illustration is presented the structure which is three stories in height, and the windows are so distributed that there is an abundance of light. The front of the building is of terra cotta, adding to its attractiveness. In the arrangement of the basement special thought has been given to motor truck tires due to the rapid development of this industry. Spaces are provided for the storage of heavy steel bands, rims and other necessary equipment. The first floor is devoted to the show room, offices, salesrooms, ladies' retiring room, etc. The woodwork is of highly polished oak, as is the furniture and furnishings. An electric lighting system, similar to that utilized at the Chicago branch, is employed for lighting in the evening. To the rear of the salesroom is the adjusting department fully equipped for this work, also a ladies' retiring room for the use of touring customers. The shipping room is at the rear and from it elevators lead to all floors. On the second floor is located the stock room for pleasure car tires, these being carried in the latest design of racks.

The Empire Tire Company, Trenton, N. J., maker of Empire tires, is mailing a novel folder, inasmuch as the cover is so cut that it represents on open door and a machine entering from the road. The inside page shows the car approaching the open door.

The Motz Tire & Rubber Company, Akron, O., maker of Motz tires, announces the appointment of the Standard Tire & Rubber Company, 104-106 Portland street, Boston, as New England agent.

The Havers Motor Car Company, Port Huron, Mich, will be represented by new Havers agents as follows: B. A. & R. Cunningham, Hackensack, N. J.; H. M. Andress & Co., Elyria, O.; Winnipeg Garage, Ltd., Winnipeg, Man.; Coleman Bros. & Dillon, Bedalia, Mo.

The Ford Motor Company, Detroit, entertained another large delegation of Ford dealers recently these agents arriving at Detroit from Grand Rapids, Mich., in a special train. The accompanying illustration shows the visitors, who were escorted to the Hotel Normandie for breakfast after which they visited the factory where groups of 20 were shown through the immense plant. At noon the visitors lunched at the Log Cabin Inn with the executives of the company, and in the afternoon listened to an address by N. A. Hawkins, the commercial manager, afterwards visiting the plant of Dodge Bros. In the evening a banquet was served at which Mr. Hawkins was toastmaster.

The Cork Insert Company, Boston, is mailing the trade a folder dealing with costs of cork inserts in practise, also a diagram curve of different types of pulleys.

The Henderson Motor Sales Company, Indianapolis, Ind., distributor for the Cole car, made by the Cole Motor Car Company of that city, announces the following new agencies: Z. C. McIntire, Montgomery, Ala.; Northern Automobile Agency, Talladega, Ala.; H. C. Dunlap, Napa, Cal.; Patterson Motor Sales Company, Hamilton, Ont., Canada; Fleming & Brown, Kankakee, Ill.; A. L. Alexander, Waterloo, Ia.; E. B. Elliott, Audubon, Ia.; W. F. Peterson, Sibley, Ia.; E. E. Freeman, Oakland, Ia.; C. F. Welmerling, Storm Lake, Ia.; E. D. Blaisdell, Dexter, Me.; Arthur P. Libby, Fort Fairfield, Me.; J. H. Penniman, Kalamazoo, Mich.; Johnson Motor Car Company, Duluth, Minn; J. H. Brown, Eveleth Auto & Repair Company, Eveleth, Minn.; Crescent Garage Company, Ogdensburg, N. Y.; George Leonard, Auburn, N. Y.; C. R. Wise, Watertown, N. Y.; Loyd's Garage, Oneida, N. Y.; Cole Motor Sales Company, Peebles Corner, Cincinnati, O.; C. H. Schubert, Barberton, O.; Ernest K. Hoge, Martins Ferry, O.; G. E. Sullivan, Oregon City, Ore.; Central Garage, Williamsport, Penn.; Chas. E. Barkl, Aberdeen, S. D.; R. L. Holcomb, Rapid City, S. D.

Lucius E. Wilson, former secretary of the Detroit board of trade, has entered upon his new duties as vice president and general manager of the Warren Motor Car Company of that city, maker of Warren cars.

The Pope Manufacturing Company, Hartford, Conn.; is contemplating a four-story addition to its plant, furnishing 60,000 additional square feet of floor space.

The Van Motor Car Company, Grand Haven, Mich., has been purchased by H. M. Pierce, J. A. Owen and Mrs. L. M. Strong of Grand Rapids, Mich. Mrs. Strong is president; M. M. Pierce, vice president, and J. A. Owen, secretary and treasurer. They will build the Pioneer roadster.

Delegation of Ford Dealers Who Visited the Plant of the Ford Motor Company at Detroit Where They Were Royally Entertained by the Company.

The Oakland Motor Car Company, Pontiac, Mich., announces that a branch house will be established at San Francisco, Cal., which will be utilized as a distributing point for Oakland cars in the western territory. A large stock of parts, etc., will be carried and a service department established. Henry L. Hornberger will be manager.

The United States Tire Company, New York City, has opened a state branch at Des Moines, Ia., at 406 West Ninth street. W. H. Mesenbrink, who has represented the company in Iowa and Nebraska for eight years, will manage the branch which will devote its efforts exclusively to the wholesale distribution of the various tires made by the New York concern.

The Peerless Motor Car Company of New England, agent for the well known pleasure vehicle of that name, announces the opening of a branch and service station at 773 Broad street, Providence, R. I., which will be in charge of J. W. Breese, a factory representative.

The Standard Woven Fabric Company, Worcester, Mass., maker of Multibestos, has increased its selling branches, having closed with Petry-Cassidy, Inc., 1416 Vine street, Philadelphia, as agent in Pennsylvania and the South, also James G. Barclay, 720 Main street, Buffalo, N. Y., the latter to act as sales agent through central and western New York State.

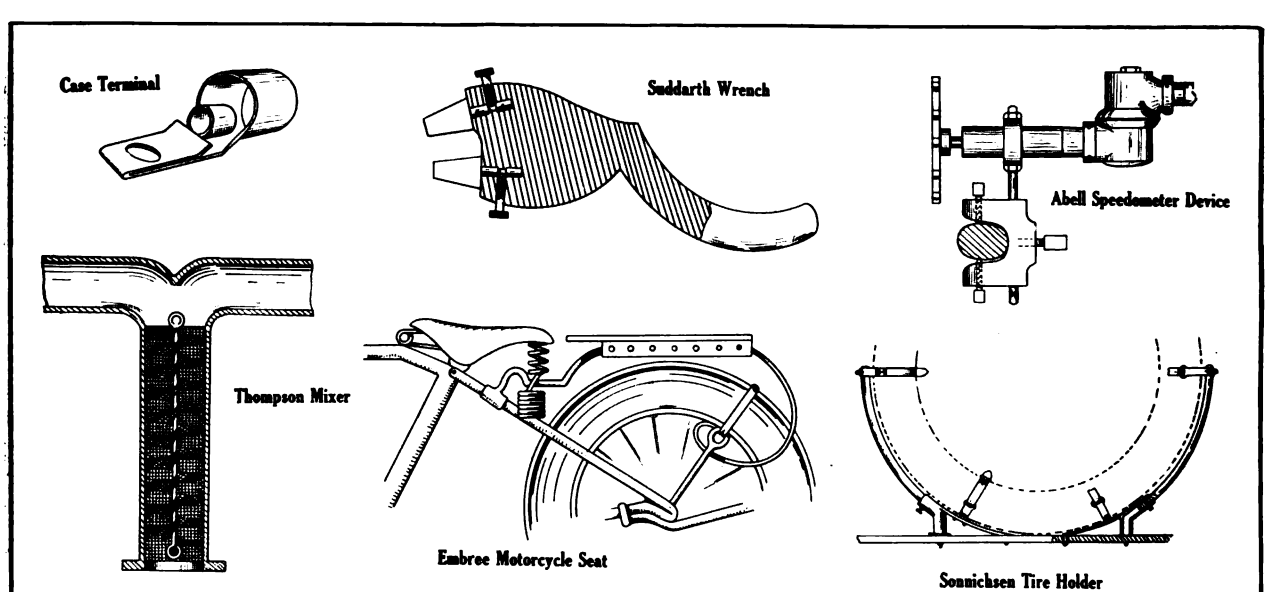
RECENT MOTOR VEHICLE PATENTS

Case Terminal.

Frank E. Case, Schenectady, N. Y., assignor to the General Electric Company of that city, has been granted a patent for a terminal for electric conductors. It consists of a metal strip having holding clips formed at opposite ends, these being arranged so as to be coaxial and to engage adjacent portions of the conductor. It is stated of the device that the larger clip holds the insulated member securely and that the wire or conductor may be fastened equally as well.

Thompson Mixer.



To secure the greatest efficiency from a hydrocarbon motor it is necessary that the fuel be mixed thoroughly with the atmosphere and in the proper proportions. Sometimes through faulty action of the vaporizer raw gasoline is drawn into the manifold and combustion chamber, impairing action of motor. Frederick Foster Thompson, Lawton, Okla., has been granted a patent for a mixer for gaseous fluids adapted to be inserted in the intake manifold between the carburetor and the combustion chamber. It comprises a tube or cylinder of perforated material and a rod arranged axially of the tube. This rod carries a helical wing or vane of perforated material and this is in contact with the edges of the tube. It is claimed by the inventor that the swirling motion imparted to the mixture drawn in by the suction of the piston breaks up any particles of fluid, and that carburetion is improved thereby.

Suddarth Wrench.

A wrench of which the inventor claims a quick adjustment of the jaws is the subject of a patent issued to Archibald S. Suddarth, Monterey, Va. It consists of a wrench stock having a head provided with deep cylindrical depressions. A pair of revoluble jaws having eccentrically arranged shanks and provided with annular grooves is fitted within the depression. By means of pins fitted through the head of the tool and extending into the grooves of the shank, the jaws are swivelly adjustable. The jaws are rectangular in cross section and taper longitudinally, thereby forming a plurality of nut engaging faces. In practise these jaws are rotated until the desired opening is secured.

Abell Speedometer Support.

Rollin Abell, Boston, has been granted a patent for a supporting device for speedometer driving mechanism. It comprises a split collar having lugs or ears, a threaded rod and a fork shaped block. The

Some Recent Patents Applicable to the Motor Propelled Vehicle, Including Case Terminal, Suddarth Wrench, Thompson Mixer and Embree Motorcycle Seat.

Digitized by Google

collar is clamped over the bearing sleeve of the speedometer driving mechanism and locked securely by nuts. A vertical rod is also locked to this collar and carries a block which is moved up or down as desired in making an adjustment to mesh the driving and driven gears of the speedometer. The block is equipped with three set screws, one of which is utilized to lock the block in position and the other members the knuckle of the wheel.

Embree Motorcycle Carrier.

Many motorcyclists utilize their mounts for carrying packages and at times desire an extra seat when transporting two persons. Clarence J. Embree, Tacoma, Wash., has been granted a patent for a seat and carrier attachment which comprises a fork having its ends secured to the rear axle and having its intermediate portion spanning the rear wheel. Resilient members are incorporated each having one end secured to the fork and the other to the frame of the machine. The seat is equipped with flanges extending downward at the sides of the resilient members and means are provided for resiliently holding the seat in position to permit of slight longitudinal movement on the spring members. Set screws are utilized to fasten the seat securely.

Sonnichsen Tire Holder.

Some motorists object to attaching tire holders to the body of the machine, preferring to carry the extra casings on the running board. Andreas M. Sonnichsen, Milwaukee, Wis., assignor to the Auto Parts Manufacturing Company, has invented a tire holder of the running board type, which is so constructed that it may be adjusted to accommodate different sized shoes. It comprises a pair of independent tubular curved brackets, these being fitted with extensions for the purpose of fastening securely to the running board. Extensions are fitted into these supporting members and means are incorporated for securing the parts. The curved brackets are moved toward or away from each other to accommodate tires of different diameter and are fitted with curved members for the purpose of fastening the shoes thereto.

SPLITDORF TWO-POINT MAGNETO.

"It is an established fact, which has been proven to the satisfaction of those who have given it a fair trial, that the double distributor magneto gives increased power to the automobiles, with which it is equipped, and many of the leading manufacturers, including the makers of National and Pope-Hartford cars are adopting this type of ignition," says Charles F. Splitdorf, New York City, maker of Splitdorf ignition specialties. "While a single spark calls for an approximate advance of 30 degrees at the maximum power developed, the actual advance is reduced 15 degrees, but owing to the twin sparks obtained and firing simultaneously, the compressed charge is ignited more quickly and from both sides of the cylinder, thus burning the charge more rapidly and tending to expand it more completely. Fouling and short circuiting are thus eliminated to a greater extent, resulting in more power with a smoother running motor and car, and requiring less work to keep the motor rings and valves clean, which means longer life."

NEW CONTINENTAL MOTOR PLANT.

Work will be started at the new plant of the Continental Motor Company, maker of Continental motors for both pleasure and commercial vehicles, on Jefferson avenue in Detroit, April 15. The first order to be filled will be that of 10,000 engines for the Hudson Motor Car Company. The old factory in Muskegon, Mich., will be kept in operation for some time, however.

CALL SALES MANAGERS TOGETHER.

At the quarterly meeting of the Automobile Board of Trade in New York City, April 5, it was decided to call the sales managers of the various manufacturing companies together for a general discussion of trade conditions, similar to that held in March for the manufacturers of commercial vehicles. Reports at hand indicated that the spring selling season was very satisfactory, and that the demand for cars was at a point which was pressing the production departments of all makers. President Clifton presided and the following were in attendance:

John S. Clarke, Autocar Company; C. W. Nash, Buick Motor Company; W. C. Leland, Cadillac Motor Car Company and Cartercar Company; Charles Glover, Corbin Motor Vehicle Corporation; James C. Dryer, Jas. Cunningham, Son & Co.; George W. Bennett, Garford Company; R. D. Chapin, Hudson Motor Car Company; E. R. Hewitt, International Motor Company; G. A. Matthews, Jackson Automobile Company; A. N. Mayo, Knox Automobile Company; S. T. Davis, Jr., Locomobile Company of America; W. S. M. Mead, Lozier Motor Company; W. C. Leland, Marquette Motor Company; F. F. Matheson, Matheson Automobile Company; W. E. Metzger, Metzger Motor Car Company; W. J. Coghlan, Moon Motor Car Company; C. C. Hanch, National Motor Vehicle Company and Nordyke & Marmon Company; G. E. Daniels, Oakland Motor Car Company, W. C. Leland, Olds Motor Works; L. H. Kittredge, Peerless Motor Car Company; Charles Clifton, Pierce-Arrow Motor Car Company; George Pope and A. L. Pope, Pope Manufacturing Company; H. O. Smith, Premier Motor Manufacturing Company; W. C. Leland, Reliance Motor Truck Company and Rapid Motor Vehicle Company; R. E. Olds, Reo Motor Car Company; R. H. Salmon, Selden Motor Vehicle Company; F. B. Stearns, F. B. Stearns Company; Alfred Reeves, United States Motor Company; C. S. Henshaw, E. R. Thomas Motor Car Company; W. T. White, White Company; George W. Bennett, Willys-Overland Company; H. A. Bonnell, general manager.

DUPLEX EXTERNAL BRAKES

SAFETY

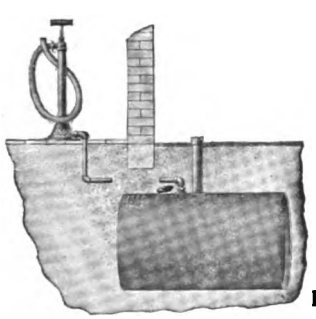
DUPLEX brakes produce maximum safety. They are America's leading brakes. Made by brake experts connected with the industry since its inception.

CONSTRUCTION

The construction and design is such that a larger braking surface is available than in ordinary brakes. Therefore less physical effort is required.

This brake acts instantly—either forward or backward.

How are your brakes?—A new set would make your car more efficient and safe. Get a set of "Duplex" brakes. Inexpensive, easily installed, do away with all troubles. Be safe and sure about your brakes above all things. Write to us today. See if we can't help you. We'll be pleased to quote prices and give full particulars.



We also make the "Raymond" Brake and "Raybestos" Brake Lining and Gyrex.

Present Day Traffic Conditions Demand Two Distinct Notes of Warning.

One Low Service Note
One Loud Emergency Note

The TUTO Horn giving these two distinct signals from the one button, one horn does away with the inconvenience and danger when a car is equipped with an inadequate bulb horn and disagreeable single loud note electric horn.

TUTO HORN

A Two-Tone Electric Horn

With the TUTO Horn the driver's hands are both free at all times to control the car. The one TUTO push button is located on the steering wheel right under the thumb. No lost motion in sounding either signal. A light touch or a heavy touch on the TUTO button will instantly change the tone and penetration of the warning note.

TUTO Horn and complete equipment ready for installing—any finish **$25.00**

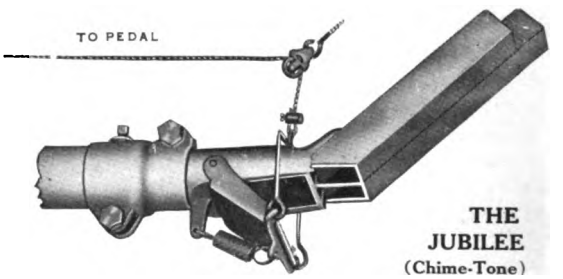
Jericho ONE TONE Horn
Jubilee CHIME TONE Horn



THE SIGNAL OF A GENTLEMAN—WARNS WITHOUT OFFENCE.

Jericho is superior to bulb horns, electrical horns and all other exhaust horns.
It is superior to the bulb horn because it is equally suitable for use on crowded city streets or winding country roads.
It is superior to electrical horns because it costs nothing to maintain the Jericho.
It is superior to all other exhaust horns because Jericho is the ONLY exhaust horn that absolutely WILL NOT CLOG.

JERICHO COSTS $7, $8 and $9, ACCORDING TO SIZE.
JUBILEE COSTS $8, $9 and $10, ACCORDING TO SIZE.

Sold by all dealers or direct from us.
Send for our free BOOKLET E, about Jericho and Jubilee and other auto accessories.

ALTHO not in the Garage Building, Selling or Planning business, our wide experience in the exclusive equipment business has led us into every quarter of the globe where we have consulted the world's greatest architects, solving some of the most difficult problems, in providing shelter for one or any number of Motor Cars, **at total building costs from $35 to $3500.** We carefully compiled this valuable data on account of its rare educational value in this comparatively new field, and while the work could not possibly be duplicated under an expenditure of Thousands of Dollars, we will distribute this entire work, together with one complete set of the Garage Beautiful, **working plans absolutely free of cost** to all active or prospective Motorists who are willing to pay for the mailing expense, **Only Ten Cents,** coin or stamps. These Working Plans are complete in every detail and designed to meet a flexible range of requirements both as to size and building material to be chosen, from a construction of wood siding to concrete, at cost estimates to correspond. Our one and only object in doing this is in hope of incidentally acquainting you with our equipment for present or future emergencies, and the expense of this **Free** offering will be charged to our advertising account. Understand, we make this unprejudiced gift absolutely with the fame of our name at stake, and in no way further obligate or annoy you, as we are not in business for such purpose. To any one unable to fully appreciate the value of this exclusive set of plans, worth alone Twenty-five to Fifty dollars, to say nothing of the **innumerable other plans suggested,** we certainly prefer your returning them to us so we can give back your Postage Money at once and send plans to another applicant, as our supply, or sincere motive, will not justify a waste.

NEWTONE

The Mile Away Electric

MOTOR HORN

Patented Sept. 5, 1911

Torpedo Type

PRICE

$20.00

Including Button and Cable

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

24 ISSUES $1.00 THE YEAR

Times Building, Pawtucket, R. I.

The Motor Truck

12 Issues $1.00 the Year

If it were possible to make a better oil than Panhard, we'd do it.

But it isn't. With 35 years' experience behind us, we know it to be the highest quality that can be produced. Remember this when you decide the question of oil for your car this season. You can't afford to take chances.

PANHARD OIL

Is refined from the best oil in the world—Pennsylvania crude. It is absolutely uniform in quality. It is filtered just enough to give it lightness of color and freedom from carbon, but not enough to destroy its lubricating body.

It keeps its body at high temperatures. It will not carbonize, unless fed too freely.

Look for the checkerboard mark on every Panhard Oil package, both cans and barrels. It is your protection and insures your getting the high quality which every automobile engine needs.

Our 1912 booklet, "Motor Lubrication", contains valuable information about the lubrication and care of an engine. Sent promptly in return for your dealer's name.

NEW TYR

a waterproof
tire dressing
that beautifies
the car and preserves

THE TIRES

Far superior to any other preparation on the market for the two-fold purpose of dressing and preserving tires. A rubberized liquid preparation that fills the cracks and holes, prevents sand blisters and keeps the rubber from cracking. New Tyr can also be used on running boards and floor of car if desired with a very dressy effect. Uninjured by temperature or weather—water has no effect upon it. NEW TYR stays put and is applied in the same manner as paint.

Try a pint can of NEW TYR—it means a better looking car and better tires, covers more surface and is far superior to any other preparation on the market. Used in Germany and European motoring countries for years.

PRICE OF PINT CAN, 75c.

AJAX TIRES

(GUARANTEED 5000 MILES)

Strong Selling Talks for Ajax Dealers

The real test of a tire is in long, rough road usage, as most motorists are tourists and not track racers. In recent years Ajax Tires have been the winning tire equipment in more reliability and touring contests than any other make of tire.

This is the highest possible recommendation a dealer can give a tire because it means that such a tire is exactly suited to the usage of his average customer. Ajax Dealers find that this is a sales-clinching point.

Ajax Dealers are entitled to the cream of the trade and they get it! Write for Ajax Dealer Inducements.

FORD OWNERS

Improve the running of the car wonderfully by the

Pedersen Oiling System

which is simple, strong, positive, and easily applied. It has only two moving parts; no twisting of the camshaft, no belting to stretch, burn or loose. With adjustable indicator on dashboard not under the hood, the working of the oiler can be observed from the seat.

Pedersen Lubricators are in use on more different cars than any one make of lubricator.

Pedersen Lubricator Co.

636 First Avenue New York, U.S.A.

BEFORE YOU BUY ANY SPEEDOMETER TRY THE

Casgrain Speedometer

Has a figure for every mile—easy to read. Accuracy guaranteed. Several models, from 50 to 90 mile scales, with and without clocks, prices $30 to $125.

TIMES BUILDING PAWTUCKET, R. I.

THE BERKSHIRE

¶ With the establishment of our Factory and General Offices in Cambridge, Mass., it is our purpose to give attention to the most minute requirements of our customers. We will endeavor to anticipate their needs and to extend to them conveniences tending to add to the pleasures of motoring. ¶ Now that the motor trade has reached a point where many good cars are offered at reasonable prices, the question of service becomes all-important.

Your Inquiry Will Receive Immediate Attention.

THE CAR THAT MADE GOOD IN A DAY

THE STURDY STUTZ, $2,000.

Consider the Stutz Car's wonderful performance in the 500 mile International Sweepstakes at Indianapolis, May 30th, 1911. At Philadelphia in the Fairmount Park Road race the Stutz car ran second in the 301-450 class—the only car that didn't make a stop.

At Los Angeles in the Santa Monica Road race the Stutz ran third—72.5 miles per hour for 50-miles. Not once was the hood raised. This is the Stutz racing record.

The mechanical construction, the simplicity of operation, the beauty of design are all in keeping with the speed perfection.

DEALERS—If your territory is still open, write today and get the agency for a productive seller. Ask for Booklet A-5.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

The Jeweled Auto-Meter Built With Even More Care Than a Watch

This is necessary, as more is expected of a Warner than a watch. It must actually *do* more than a watch. It must be more sensitive and yet be able to stand hour after hour and year after year of jolting vibration.

Every Warner is a *jeweled* instrument. Each is tested time and time again before it goes to grace the dash of your car—to be the most looked-at as well as the most *responsible* part of your car. Therefore, we can make the guarantee and feel safe in making it, for the Warner is trouble-proof.

Dial Illumination

Two tiny electric lights underneath bezel, which concentrate rays on clock face and upon speed and distance figures; no light escaping to blind the eyes.

Speed Indicating Scale

Circular aluminum dial mounted on standard ship-chronometer pivot. Hairspring returns disc to zero when speed stops. Total weight 106 grains. Figures can be plainly read by the average eye 10 feet away.

Bezel

Made of heavy seamless brass tubing, accurately machined. Spun around thick French plate glass, which cannot become loose and rattling. Absolutely dust-proof, water-proof and oil-proof. These are, of course, exclusive Warner features.

Total Distance Indicator

Odometer registers to 100,000 miles before it automatically resets. The season odometer runs independently of trip odometer.

Trip Indicator

Trip odometer registers to 1,000 miles and automatically resets to zero. Another reset turns up any desired mileage on trip odometer, thus you may pick up and follow a route book, beginning at any point and have trip mileage absolutely agree with route book.

Warner Unbreakable Flexible Shaft

Driving shaft troubles and annoyances entirely wiped out by this new unbreakable casing. Made from high-carbon spring steel wire of great tensile strength. Heavy outer wire coiled over smaller inner wire into perfect oil-tight flexible casing; highest grade of vanadium steel used for inside driving chain. Heavily plated with either brass or nickel.

Warner Instrument Co., Beloit, Wis.

Main Offices and Factory: 1270 Wheeler Avenue

BRANCH HOUSES maintained at Atlanta, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Denver, Detroit, Indianapolis, Kansas City, Los Angeles, New York, Philadelphia, Pittsburgh, Portland, Ore.; San Francisco, Seattle, St. Louis. **Canadian Branch,** 559 Yonge Street, Toronto, Ontario.

The Warner can be secured through reputable automobile dealers in any city or town in the United States.

Model M2—$125

Other Models $50 to $145

WARNER AUTO-METER

(180)

NOTE TO DEALERS: When suggesting a speed indicator always recommend the Quality Warner *first*. Then if you finally have to sell something inferior because of price, your customer can't blame you for his dissatisfaction—he refused the Warner against your judgment.

Truffault-Hartford Shock Absorber Patent Again Sustained
Westen Shock Absorber Enjoined

THE United States Circuit Court of Appeals for the Third Circuit has just handed down an opinion affirming the decision of the Circuit Court for the District of New Jersey, holding that the Truffault Patent is valid and that the Westen Shock Absorber is a clear infringement thereof.

The Court of Appeals, the Court of last resort in patent cases, makes this decision **final.** The manufacture and sale of the Westen Shock Absorber is perpetually enjoined.

We have always believed that the Truffault Patent was fundamental and covered broadly all types of rotary friction Shock Absorbers. This belief has been affirmed by the highest courts and we hereby give notice that we shall protect our rights to the fullest possible extent.

WARNING

We wish to warn the trade and individual automobile owners against the use or sale of infringing Shock Absorbers, some of which are advertised as non-friction devices. Years of experience have taught us that no successful Shock Absorber can be made which is not essentially a friction device, despite the misleading statements of other manufacturers to the contrary. We are advised by our attorney that our patents are basic and complete and we intend to bring suit against all manufacturers, dealers or users who in any way encroach upon our rights.

APR 29 19

We Lubricate the World's Motors.

UNDER its Gargoyle trademark the Vacuum Oil Company supplies lubricants to—

The floating armament of the world's leading naval powers.

To leading ocean steamship companies throughout the world.

Outside of the American market, to over seventy foreign automobile manufacturers.

To practically every aeroplane in active use, both private machines and the military aeroplanes of the leading powers.

To leading manufacturing plants at home and in every quarter of the globe.

For over half a century we have made lubricants, not as by-products, nor as temporary profit makers, but as a serious business.

In power-engineering circles, our standing as the authoritative leaders in high-grade lubricants is unquestioned.

No one lubricating oil is best for all cars. That is why we analyzed all automobiles and now make five grades of Gargoyle Mobiloils to supply them.

The quality of Gargoyle Mobiloil necessitates a price that is somewhat higher than that of the usual automobile lubricating oils.

However, their use should result in an actual saving. Properly used, they will go farther than less correct oils.

Gargoyle Mobiloils are supplied to owners through garages, auto-supply-stores, and others who handle lubricants.

If the retailer who generally supplies you carries no stock at present, you should have no difficulty in securing through him the grade of Gargoyle Mobiloil you require.

They are put up in barrels, half barrels, in 5 and 1 gallon cans. All are marked with our Gargoyle trademark.

Send for our free chart which shows the correct grade of oil for every American car and most of the foreign makes.

GARGOYLE

Mobiloil

A grade for each type of motor.

If oil saves power, it follows that one oil saves more power than another.

VACUUM OIL COMPANY, Rochester, U. S. A.

1912 Annual Catalog No. 22

Our 1912 Catalog, the Largest and Most Complete Catalog of the kind, containing 256 Pages, is Now Ready for Distribution. The Circulation is Limited to ONE HUNDRED THOUSAND Copies. It will be mailed to any one on request.

CUT PRICES

Concerns that offer Large Discounts make it their practice to INFLATE LIST PRICES and then offer Large Discounts, which are somewhat misleading. We have seen a catalog in which a certain spark plug is illustrated, "PRICE $2.50, OUR PRICE $1.00," while THE STANDARD LIST or RETAIL PRICE for the same spark plug as illustrated in Our Catalog and advertised by the manufacturer is $1.00 each. Their CUT PRICE Therefore Is Not Lower Than OUR LIST PRICE.

DON'T BE DECEIVED BY LARGE DISCOUNTS QUOTED FROM INFLATED LIST PRICES . . . .

TEXACO
MOTOR OIL

YOU, the car owner, need no longer number cylinder troubles among your motor cares.

Pitted cylinder walls and valves, weak compression, faulty ignition, can almost invariably be traced to an inferior cylinder oil.

The perfect cylinder oil contains no carbon impurities. Its lubricating qualities have not been impaired in order to eliminate carbon. It shows a zero cold test.

Texaco Motor Oil meets these requirements. The most careful working tests have shown none of the troublesome carbon deposits so common with motor oils. It h· **shoul** ·ely clean. It has sufficient body to lubricate ıders never "dry out," never become scarred ¶ Send for (ıt has a cold test of zero and thereby eliminates all of the lubrication troubles usually caused by cold weather.

These are strong statements. You may feel skeptical. The best proof of their truth is in the use of the oil itself. Try a can.

Sold in 1 and 5 gallon cans at garages and supply shops. For instructive booklet, "About Motor Lubrication," address Dept. B. 7 West Street, N. Y. City.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Auto[illegible] Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF [illegible]venue

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass ca.. the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

	"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA" 2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

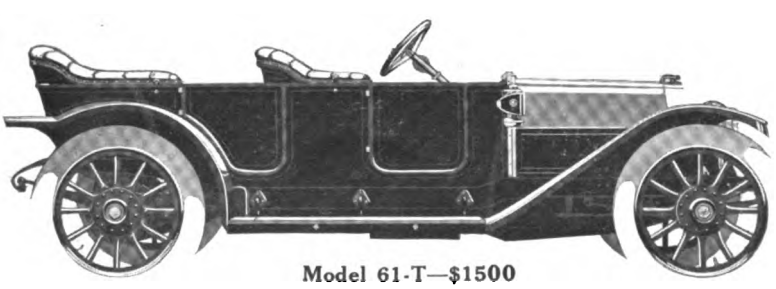
Overland



IF judged by the value received in the average forty-five horsepower five-passenger touring car our Model 61 will give you $1800 worth for $1500. It gives you everything that you get in the best of the other cars of this type and a little more than you can get in the average.

¶ Take the specifications of our Model 61---line them up against any set of $1800 specifications and you will find them practically the same. And not only are the base specifications almost identical but the appearance, comfort, finish and general construction are equal.

¶ If the $1500 Overland gets you about as much as you get in any other $1800 forty-five horsepower five-passenger touring car why should you pay the difference?

¶ Send for our interesting catalogue. Ask for book K44.

The Willys-Overland Co., Toledo, Ohio.

Model 61-T—$1500

Wheel base, 115 inches; body, 5-passenger fore-door touring; motor, 4 3-8x4 1-2; horsepower, 45; Bosch magneto; tires, 34 x 4 inch Q. D.; finish, Brewster green, ivory stripe, all bright parts nickel-plated; 3 black and nickel oil lamps; 2 black and nickel gas lamps. Price, $1500.

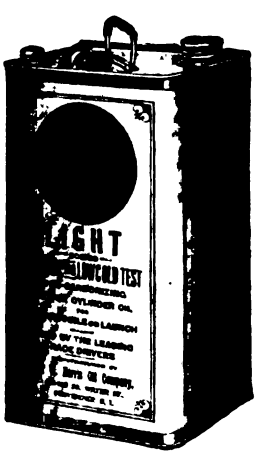
HARRIS

TRADE MARK—REG. U.S. PAT. OFF.

OILS

Actually Save You Money



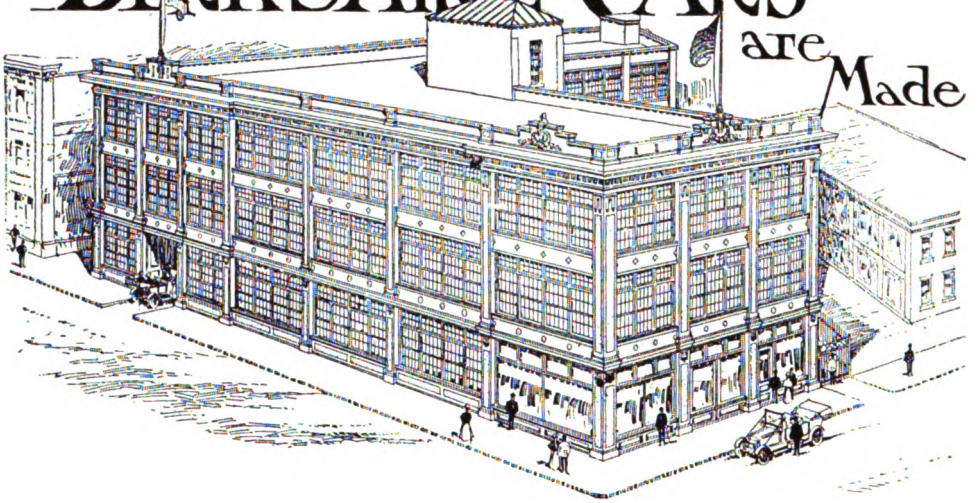
THE SAVING is in the increased mileage they give. There is more lubrication in every drop of HARRIS OILS than there is in ordinary lubricants.

THE SAVING is in the reduced cost for upkeep. Remember that the soot-deposit ingredients are eliminated to the greatest posssible extent. This naturally reduces chances of carbonization. There is less cost for repairs and overhauling.

THE SAVING is in the absence of lubricating troubles. Your engine runs smoother—no knocking or pounding, no constant grinding of valves.

It costs but little—a trifle to prove the efficiency of HARRIS OILS. One or two cans tell the story more graphically than thousands of advertisements.

If you, too, believe HARRIS OILS will save you money and give you a better motor—why not try them?



If your dealer does not sell Harris Oils, send 80 cents (for 1 gal. can) or $3.75 (for 5 gal. can) and we will ship same prepaid.

Not Built for Show

The Stewart Speedometer is *not* built for *show;* it's built to show how *fast* you *go.* It's never *fast* and never *slow;* it never misses a second to the hour nor an inch to the mile.

If we spent a million dollars on each Stewart Speedometer we couldn't make a more *workmanlike* instrument. The added expenditure would all go for fol-de-rols and frou-frous. We could diamond-stud the *dial*—we could gold-plate the *hands* and emblazon the *case* with sapphires, but for all the *extra* you'd pay you'd only get *display.*

The Stewart Speedometer is the most *accurate*—the most *reliable*—the most *durable* speed measure that can be made. If you give *more* for any other speedometer you get *less.* A higher price means *"front,"* not *value.*

Not an *aristocrat*—it *works.*

Magnetic principle—jewel bearings—wearing parts hardened and polished; open dial, large figures, easily read; absolutely accurate; 100,000-mile season odometer, 100-mile trip register, can be reset to any tenth of a mile. Guaranteed for five years. Strongest flexible shaft, drop forged swivel joint, noiseless gears.

1913 PEERLESS CARS

Are Equipped With

GRAY & DAVIS

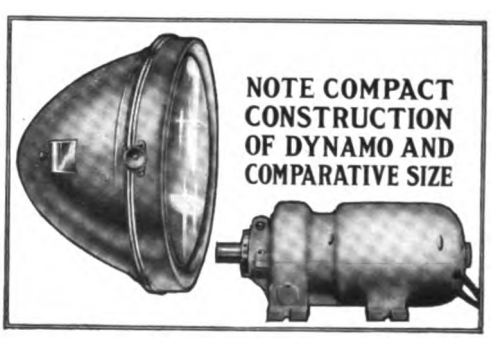
Lighting Dynamo System and Electric Lamps

Last year's PEERLESS Cars also carried GRAY & DAVIS Dynamo and Electric Lamps. The PEERLESS engineers selected this equipment in preference to any other because every known road and laboratory test had proven it to be absolutely efficient and reliable—the best electric system in the world.

After a year's service on all PEERLESS Cars, under every conceivable condition, these engineers have again selected GRAY & DAVIS Dynamo and Electric Lamps for 1913 equipment which

proves beyond question

that this system stands today—pre-eminent among lighting systems of Europe and America.



You also want the proven best—the GRAY & DAVIS Dynamo. Do not accept a transformed train-lighting system or a mere "battery charger" for your car. Demand and insist upon GRAY & DAVIS equipment.

What the Peerless Company says:

"A factor in the unapproached completeness of Peerless Motor Cars is the Dynamo Electric Lighting System. It is installed on every car as a part of the standard equipment."

VOL. XXXIII, No. 6 APRIL 25, 1912 Price $1.00 the Year

TYPES OF ROTARY VALVE MOTORS.

Constructional Features of Three Designs Now Offered to American Public, Illustrating Wide Variance in Method of Attaining Similar Results.

ABOUT a year ago the Reynolds Motor Company of Detroit made its preliminary announcement of a four-cylinder, four-cycle, rotary valve motor, designed for automobiles and motor boats. Several of these engines have seen satisfactory service since that time in marine work, and it is understood that others have been given extended tests in various makes of cars and with splendid results. The latest product of the company is a six-cylinder power plant, embodying all the features of the original, but with some slight detail modifications. A description of this will prove of decided interest, in connection with the discussion of non-poppet valve motors begun in the last issue of The Automobile Journal.

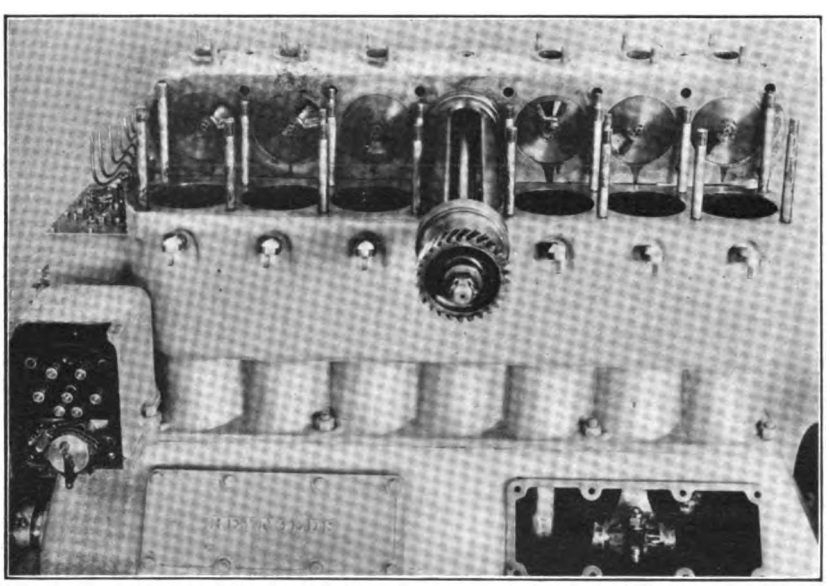

Fig. 1—Six-Cylinder Reynolds Rotary Valve Motor Partly Dismantled, Showing Valve Location and Master Gearing.

Fig. 1 presents the six-cylinder unit partially assembled, but with the cover plate and master gearing removed to illustrate the principal difference between its construction and that of the four-cylinder design, which is indicated in Fig. 3. In this latter it will be noted that the master gear is located in a separate housing at the end of the train which operates the individual valves in the respective cylinder heads. In the six, this master gear is located in a separate compartment in the centre, between each set of three cylinders. This is the principal distinction between the two models, but it will be necessary to describe the features of the Reynolds rotary valve in more detail before considering the effect of this change upon the working of the motor. The valve itself is seen in Fig. 3, between the two main views of the cylinder head assembly. The view at the right is that presented by looking into the cylinders, and in the one nearest to the master

Digitized by Google

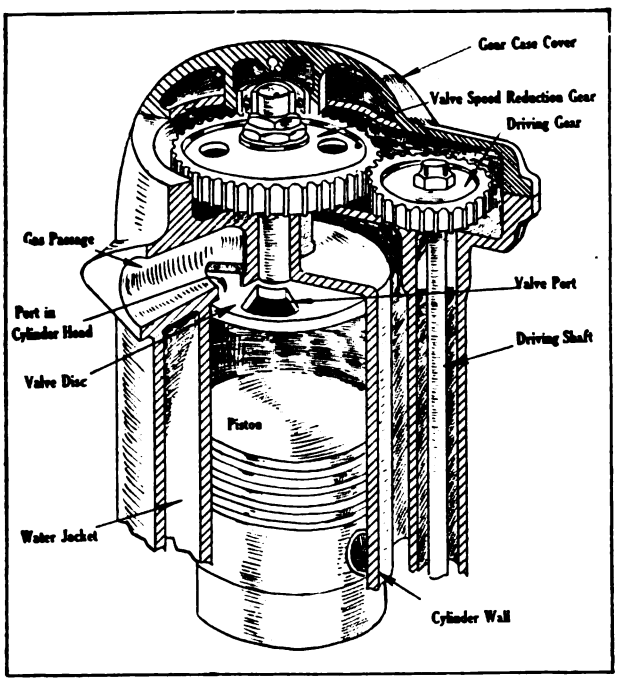

Fig. 2—Sectional View of Cylinder in Reynolds Motor, Indicating Position of Valve and Intake Port.

driving gear, the valve has been removed to show the construction of the cylinder head. It will be noted that there are two ports in the cylinder head, and only one in the valve. The exhaust is so constructed that it remains open about 14 per cent. longer than the inlet, providing for complete scavenging of the cylinder during the exhaust stroke of the piston.

Reynolds Valve Disc.

In the Reynolds motor the pistons are the only reciprocating parts. The valve discs are in effect sliding members, except that they rotate on top of the cylinder head, their ports registering with inlet and exhaust openings in these members. After careful experimentation, the maker has constructed the discs of a special bronze composition, and it is claimed that extended use has demonstrated that the amount of wear is so slight as to be possible of detection only with a micrometer.

These valves are .0625 inch less in diameter than the bore of the cylinder, so that in an engine of 3.5-inch bore, for instance, the valves are 3.4375 inches diameter, .5 inch thick and with a stem .75 inch diameter. The stems are formed integral with the discs. Operation is at one-half speed, and the timing and order of firing may be arranged to suit the various individual needs.

Broached in the bronze disc is a triangular hole or port, opening approximately one square inch. Formed in the cylinder head are two ports, also triangular in shape. The action of the valves is through a train of spiral steel gears, .875 inch face, and carried in a recess on top of the cylinders. This construction is brought out more clearly at the left of Fig. 3.

Operating Gears.

To the .75-inch stem of each of the four or six valves is keyed one of these spiral gears, so that all valve stem gears are in mesh. Primary action is from a steel spiral gear keyed to the crankshaft, this meshing with a bronze gear keyed to the hub of another steel spiral gear on the .75-inch transverse shaft. This latter steel gear meshes with a bronze spirally cut member at the base of the .75-inch vertical shaft, fitted at the bottom with a thrust bearing. This shaft is carried in an integral housing at the end of the cylinder casting in the four-cylinder models, as outlined at Fig. 3, but in a central dummy cylinder in the six, as noted in Figs. 1 and 5.

At the upper end of this vertical shaft is a spiral gear which meshes with the first of the four gears in the four-cylinder unit, imparting a continuous rotary movement to the valve discs. In the six, the top of the vertical shaft caries a helical gear, which actuates three gears each way, thus serving to rotate the six valves on their seats. This central placing of the driving gear is held to balance the drive and minimize back lash. The design has been so worked out that the Reynolds six can be delivered to run permanently in either direction as desired.

The valve stems being bronze, virtually supply their own bearing surfaces, working on the cast iron of the cylinder heads. All valve gears are secured through lock nuts, and with these in place enough space exists to support imported ball bearings on the valve stems, these recessing in the aluminum cover plate when it is bolted in position. Adjustment of

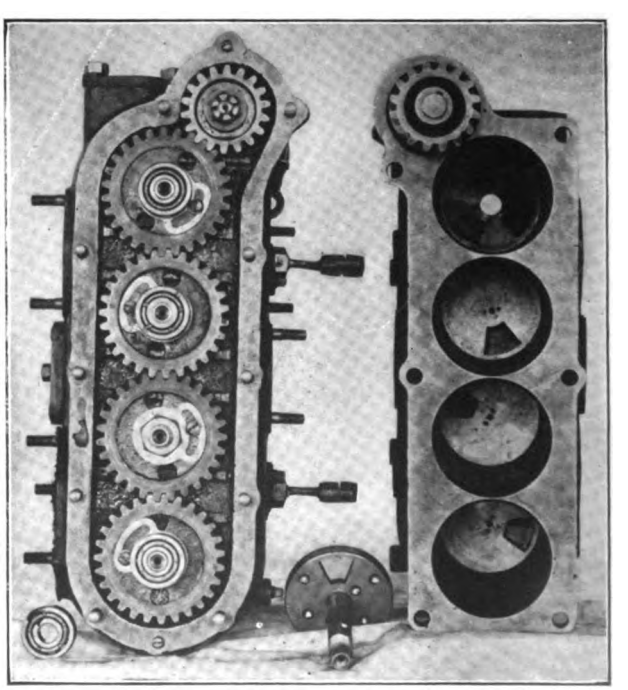

Fig. 3—Train of Gears, Valves in Place in Cylinder Heads, and Other Components in Reynolds Four-Cylinder Model.

Digitized by Google

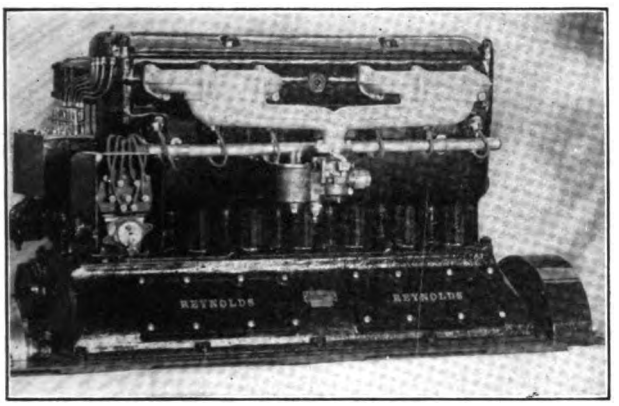

Fig. 4—Reynolds Six-Cylinder Model Completely Assembled, Presenting Neat and Compact Appearance.

the stems is such that a smooth rotation is provided without undue wear. Since the valve never leaves its seat, there is held to be slight accumulation of carbon, and this is cared for by countersunk holes in the top face of the valve, which also serve as oil receptacles. Careful study of Fig. 1 will reveal the oil leads to the various gears, from which lubricant finds its way to the valve discs.

The Four Cycles.

Fig. 2 will serve to illustrate the cycle of operation, this being a cut-out section through one of the cylinders, with the valve disc exposed. It will be seen that the triangular port in the disc is registering with the inlet port of the cylinder head, and the piston is on its way down on the suction stroke. By the time the piston has reached the bottom of its stroke a full charge of gas has been drawn into the cylinder. The opening in the disc has then passed by the inlet port in the cylinder head and there is no opening at the top of the cylinder during the compression and power strokes. When the piston reaches the bottom of its travel on this latter, the opening in the valve begins to register with the exhaust port in the cylinder head, not shown in the drawing, and scavenging commences.

The cylinders of the Reynolds motor are cast en bloc, with water jackets integral, and there is a gradual taper from the top to the base of the jackets, which adds materially to the smooth and finished appearance of the whole. With the four, the bore is 3.5 inches and the stroke 4.5. With the six, the bore is 4.5 inches and the stroke six.

Materials Employed.

Pistons, like the cylinders are cast of a very fine grade of gray iron and are carefully finished. These are fitted with four .25-inch compression rings, cast separately, turned on the outer faces, ground on the edges and untouched on the inner faces. This means that the scale on the inner faces is not removed, it being the opinion of the designers that to do so effects a loss in the natural elasticity of the rings. The bottom ring groove shoulder is beveled at 45 degrees for the purpose of scraping the oil descending the cylinder walls and forcing it through holes drilled in the piston and thence to the bottom of the crankcase.

Among the other features incorporated in the design of the six-cylinder model is the provision for accessibility. The gearcase cover is removable from the head to permit of simple adjustment of the valves. The head is removable from the cylinder casting, as shown herewith. The cylinders may be removed from the base, and the upper half of the base may be separated from the lower half, leaving the crankshaft, pistons and rods undisturbed, if desired. More than this, removable plates are provided on both sides of the crankcase, and these are of such generous size that a bearing can be replaced easily, should this become necessary, without taking down any part of the motor. It may be mentioned here, that the bearings employed are of the finest grade of bronze, with genuine babbitt

lining, assuring long life and great durability.

Silent Valve Motor.

The Silent Valve Company of America, Connersville, Ind., has brought out the Silent Valve motor, designed by E. L. Russel, while engaged as a district manager for the Bell Telephone Company at Dallas, Tex., in 1899. He worked on the principles involved for some 10 years before he was rewarded with anything in the nature of success, but for the past two years the motor has been taking on its present form, until the company offers what it believes is a thoroughly tested automobile engine of the rotary valve type.

The motor is shown in accompanying illustrations, as offered to the public in the four-cylinder form, with bore of 4.5 inches and stroke of 5.5. Fig. 10 shows a view of the motor from the bottom, with the valve actuating gears, and it will be noted that each valve serves for a pair of cylinders. Fig. 8 presents the valve and actuating mechanism assembled and completely dismantled. The valve is geared one-quarter crankshaft speed, and its periphery is so constructed as to provide suitable inlet and exhaust ports to carry each of the cylinders through four cycles. This is accomplished once each half-revolution of the valve, as this is provided with two inlet and two exhaust ports.

It will be seen that the valve is made conical or tapered, the purpose being to provide means for adjusting it to and from the seat as may be required in order to compensate for variation in the size of the valve and seat due to heat or wear. The incoming gas enters through the valve cover to the centre, thence through the inlet port of the valve, which registers with the cylinder port. Following the compression and expansion of the charge the burnt gas finds its way out through the exhaust port or the passage which extends through the centre of the valve and which, when registering with the cylinder port, also registers with the exhaust side of the valve seat. Fig. 11 gives two sectional views of the valve itself, and still further brings out its construction.

In order to accomplish its functions automatically the valve is provided with a peculiar and special actuating means, which may be described as follows: The lower end of the valve is constructed so that in combination with a suitably arranged pin and rollers, it serves the function of a nut by means of which it is drawn down positively onto the valve seat, since the rollers are made to engage a double spiral grooved collar or yoke member, which is assembled on the upper end of the valve shaft.

This spiral grooved collar is fitted with two lugs and two pins located in their centres. These lugs are engaged by two compression springs, which also en-

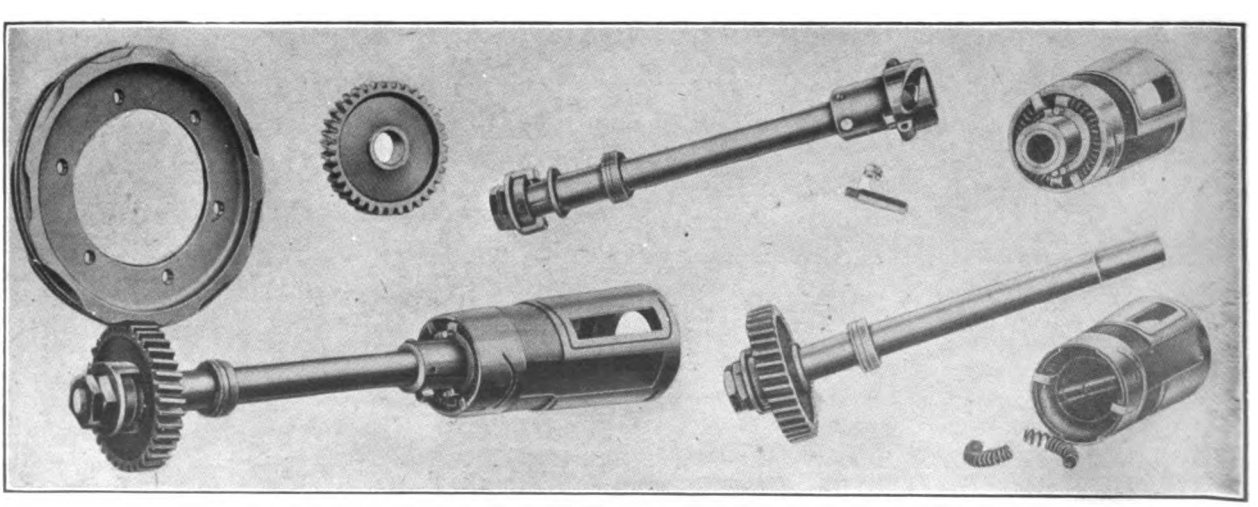

Fig. 8—Valve in Silent Valve Motor Completely Assembled with Actuating Mechanism and the Various Components Detached for Better Examination of Its Construction.

Digitized by Google

gage two posts or bosses forming a part of the construction on the lower end of the valve. It is apparent that the valve is drawn into its seat by means of the spiral grooved collar and the torque exerted by the springs around the axis of the valve, and further that the valve cannot move axially on its seat without rotating the valve shaft, as it is literally screwed onto this shaft. Consequently it cannot be forced from the seat through pressure from the cylinder exerted over the projected area of the ports.

Operation of Mechanism.

The operation of the valve actuating mechanism in driving forward is as follows: The valve as described is too tight on the seat to allow free rotation. However, on turning the engine over, the valve shaft travels ahead of the valve a fraction of a degree, consequently the spiral grooved collar lifts the valve by means of upward thrust of the collar against the rollers. After the engine is started, the valve naturally increases in diameter from expansion due to the heat of the engine, thereby momentarily causing it to

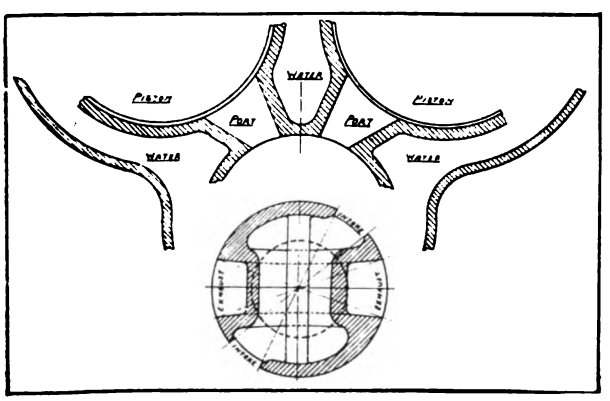

Fig. 9—Outlining Position of Valve with Reference to Pair of Cylinders in Silent Valve Motor.

run tighter on the seat. As soon, however, as the torque or turning effort of the valve increases the slightest amount, the spiral grooved collar travels in advance of the valve a fraction of a degree, thereby raising the valve to a higher running level and easing it on its seat.

When the load of the engine is reduced and the temperature of the valve becomes less intense, the latter returns to the lower running level, since it contracts and becomes smaller in diameter. The action of the valve is thus described as automatic under all conditions of temperature and it runs within a fraction of a thousandth of an inch of the seat at all times, or as close as the thickness of the lubricant will permit. The wear of the valve and the valve seat is automatically compensated for through the same means, which adjusts the valve for variation of temperature.

What is termed a reverse drive cam is assembled with the spiral grooved collar and the valve drive yoke, this serving the function of lifting the valve slightly during the backward rotation of the engine.

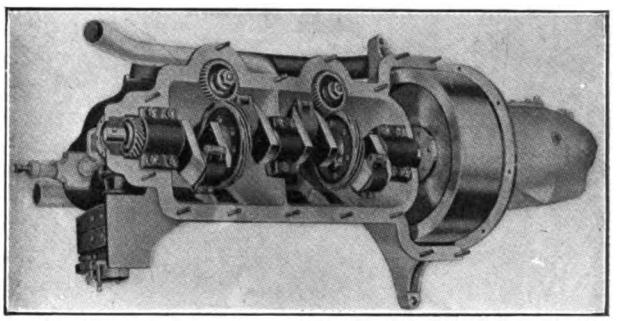

Fig. 10—Looking Up into Silent Valve Cylinders, Presenting Valve Actuating Mechanism.

Otherwise, the valve would be jammed on the seat owing to the screw action of the collar. This reverse drive cam and the valve drive yoke move positively with the valve shaft, as they are rigidly fastened to the shaft by means of a taper pin. The spiral grooved collar, however, only moves positively with the valve shaft during the forward rotation of the engine, as it is driven by means of lugs or wings on the sides of the valve driver, which engages studs or pins located in the lower side of the collar. It will thus be seen that the forward drive yoke remains inactive when the engine rocks back and that at such time the reverse drive cam becomes operative in performing the function for which it was designed.

Interior of Valve.

Having reference to Fig. 8: The driving mechanism is contained within the cylindrical base. The exhaust passage goes straight through the valve. The inlet opening is through the top, is separated from the exhaust port by suitable walls and opens into the inlet valve ports. Oil grooves are provided on the sides as indicated and these communicate with a small hole in the top, which registers with the oil supply pipe once each revolution. There is a decided suction in the inlet port which draws the oil from the upper groove and distributes it over the

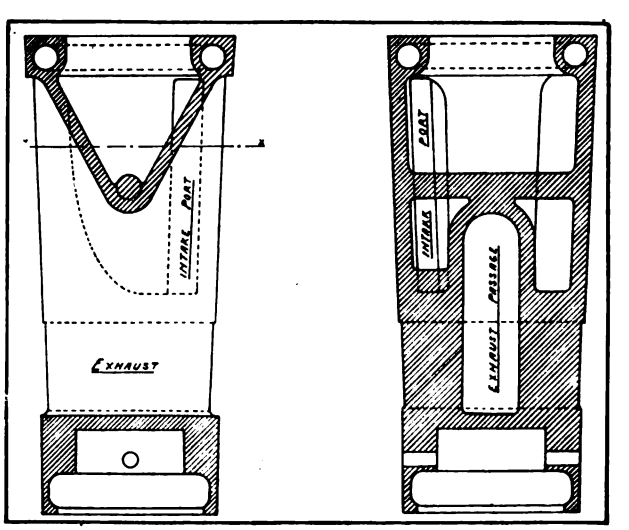

Fig. 11—Section through Silent Valve Cylinder and Valve as Seen on Intake Stroke.

Digitized by Google

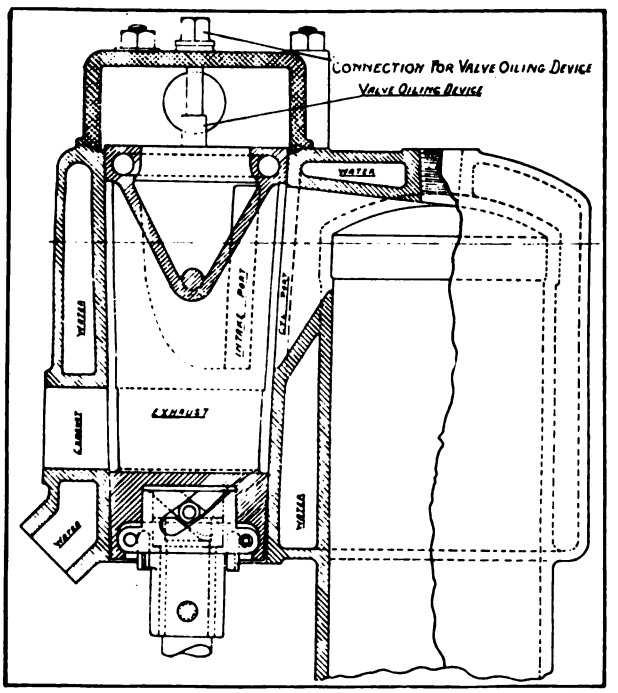

Fig. 12—Two Views of Silent Valve, Showing Construction of Inlet and Exhaust Ports.

whole length of the valve seat and its face.

Fig. 12 shows a section through the cylinder and valve, with the latter in position on the inlet stroke. The charge may now enter over the top of the valve and through the inlet port. By reference to the right of Fig. 11 it will be seen that when the valve has turned so that its exhaust port registers with the port in the cylinder, the burnt gases will pass directly through to the exhaust manifold and the open air. Fig. 9 presents the valve and its position between the two cylinders, although in this case the former has been pushed away to show the construction at this point. By careful study of this and the other drawings the whole design will be understood readily.

The Darracq-Henroid Motor.

A rotary valve motor, which had its origin in France and which made its first appearance in America during the Importers' Salon at New York in January, is the Darracq-Henroid, utilized in the 1912 Darracq cars, and represented in this country by Ducasse & Co., 735 Seventh avenue, New York City. This design employs a cylindrical sleeve, which is hollow to obtain a greater degree of lightness and rigidity, on the periphery of which are cut four notches, each serving to connect one cylinder alternately with inlet and exhaust ports. The round portion of the sleeve covers the port in the engine cylinder during the compression and expansion strokes, and as a result the sleeve itself travels at half crankshaft speed.

In order to set the valve cylinder in motion a gear wheel is located at the end. Another gear wheel is keyed on the end of the crankshaft, and the two are connected by a vertical shaft bearing a worm gear at either extremity. The relation between these gear wheels and worms is so calculated as to obtain one revolution of the sleeve for two of the crankshaft, and the correct valve timing is thus attained.

Fig. 13 herewith presents the motor assembled, and Fig. 14 the bloc casting and the cylindrical sleeve or distributor as it is termed. This distributor is located along the side and at the top of the engine cylinders, as is brought out more clearly in the sketch, Fig. 15, which shows the cycle of operations.

How It Operates.

The drawing at the right indicates the intake stroke, when the revolving distributor has reached a point where the slot registers with the port in the side of the engine cylinder. The piston has moved downward from the beginning of the stroke and will continue in this direction until it reaches the point indicated next, which depicts the beginning of the compression stroke. The third shows the position of the members at the time of firing, while the last presents that of the piston and distributor at the time of exhaust.

During the first part of the intake and until the downward movement of the piston discloses the orifice of the feeding port no gas will be admitted to the cylinder, and this will last during a period equal to about one-sixth of the total piston travel. The designer claims that with the very large section which the distributor affords to the exhaust gases, the cylinder is emptied with such unusual abruptness that nearly the whole of the residue gases, as the consequence of the laws of expansion of gas, is exhausted and the moment the inlet begins the top of the cylinders would contain a burnt gas at a very weak pressure inferior to that of the atmosphere, and this would cause the feeding to take place much more quickly and thoroughly as soon as the feeding orifice is disclosed. This brings up a question upon which there is a decided difference of opinion among engineers, and involves the problem of the exact volume

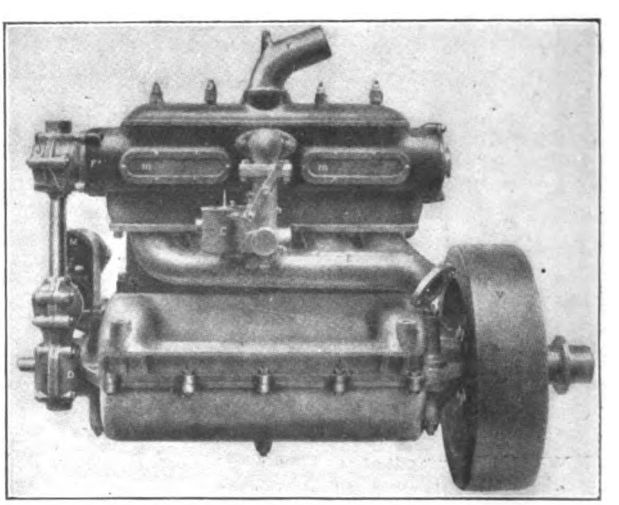

Fig. 13—Darracq-Henroid Four-Cylinder Rotary Valve Motor, Completely Assembled.

Digitized by Google

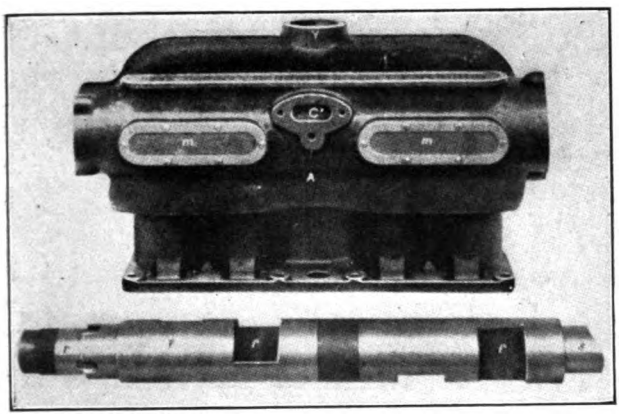

Fig. 14—Darracq Cylinder and Distributor Casting, and Rotary Valve Sleeve Below.

of burnt gases which must be retained in order to improve the suction stroke subsequent to the explosion.

Matter of Lubrication.

At no point along its periphery does the distributing sleeve come in contact with the surface of the casing in which it revolves. The designer claims that as it is carried at either end on large ball bearings it will defy wear forever. But if there were no means of filling this intervening space the engine could not become gas tight.

The space between the sleeve and the casing is only about a twentieth part of a millimeter, the exact measurement having been determined by a series of experiments covering many months. It is claimed that were it any larger, the oil coating, with which this space is sealed, would be swept away. As the matter now stands this sleeve is completely covered with a thin coating of lubricant, which forms an oil joint exactly sufficient to support the necessary pressures. The distributor is placed in such position that at the moment the compression reaches its maximum point, the top of the piston has covered the orifice of the port leading to this oil coating, and the latter has no more part to play during that portion of the cycle.

(To Be Continued.)

CONNECTICUT CAR FIRST IN JERSEY.

A Connecticut car, bearing the registration number 3444, was the first machine to take advantage of the new reciprocity provision of the New Jersey automobile law. April 2, the owner of this car was standing in front of the state house in Trenton, when Governor Wilson signed the so-called Stickel bill, which went into effect immediately. He at once took off his special New Jersey license plate and proceeded down the street, being stopped at nearly every corner to explain to the policeman on the beat that New Jersey had officially decided to be neighborly once more.

NEW SIX-CYLINDER CAR.

W. H. Cameron, formerly designer and engineer for the Overland Motor Car Company of Toledo, now the Willys-Overland Company, is said to have interested W. E. Flanders of Detroit in the production of a new six-cylinder car, which it is understood will be placed in the market in the near future from the plant of the Universal Motor Truck Company of Detroit.

SECOND ANNUAL MOTOR TRUCK PARADE.

Result of Remarkable Demonstration Indicates That Business Concerns in New York City Are Using 100 Per Cent. More Commercial Vehicles Than Last Year.

WHAT is considered by those familiar with the rapid development of the mechanical transport to be the largest and most impressive demonstration of the practicability of power wagons, took place in New York, Saturday, April 13, when something over 400 machines participated in the second annual parade held under the auspices of the Motor Truck Club of that city. It is interesting to note that the majority of entrants were owners, representing leading business concerns, converts to the more progressive type of transportation, many of whom took part because of their own enthusiasm. The display also served to impress those not familiar with the modern vehicle that the day of experimentation is past and that the motor car, whether propelled by gasoline or electricity is rapidly replacing the horse drawn equipment.

Formation of New York's Second Annual Parade of Commercial Vehicles at Battery Park Ready for the Start.

Although the weather was more propitious than last year when the machines were operated in a rain storm, the overcast sky with occasional light showers had its effect upon the crowds, but not upon the entrants. By actual count at the reviewing point on Broadway and 100th street there were something like 420 cars, and it is probable that there were nearer 500, as many joined which were not entered, these falling into line from time to time. Some idea of the extent of the parade may be obtained from the fact that cars were 50 minutes passing a certain point. That there is a decided increase in the use of motor trucks was shown by comparison with the first demonstration in which about 200 machines took part a year ago.

The formation was at Battery park from which point the route led to Bowling Green and thence to 125th street, a distance of approximately eight miles, which was covered in 2:30:00. The parade wound its way through the financial and business sections, including those districts where it would attract the attention of business men who would be most likely to become interested in the purchase of motor trucks. This was in decided contrast to the event of last year when the cars made a circuit of the upper section of the city. The one-way route also had its special features as many owners took advantage of this to load their machines with different kinds of merchandise, which was delivered uptown or at places in vicinity of the finish.

In spite of the difficult task of forming the three divisions the start was but 30 minutes late and this was due largely to the confusion of distributing banners and flags, although traffic obstructions played their part. As a rule, there was little decoration save the club flags and uniform signs attached to the cars for easy identification. Many of the salesrooms of "Automobile Row" were decorated with flags and emblems of the Motor Truck Club, and as the vehicles filed past they were given a hearty reception. Perfect order was maintained at the start, and the machines formed a continuous procession in three divisions,

Digitized by Google

but because of the heavy traffic the parade was much scattered when the financial district was reached, gaps showing in the formation.

All types of mechanical transports were in line, these ranging from the light delivery car to the 10-ton truck. Every entrant was permitted to load his machine with whatsoever he willed, and the majority took advantage of the privilege. As a result, the different industries were represented, these ranging from the florist to the transportation of coal. The wide variety in body design was also demonstrated, including special dumpers, furniture vans, brewery trucks, etc.

The first division, which was under the supervision of Grand Marshal E. W. Curtis, Jr., was composed of 124 trucks of 17 different makes, these being ar-

ranged in alphabetical order. T. A. Aspel was marshal of the second division, in which there were 116 machines, representing 13 different manufacturers, while C. W. Fletcher was in charge of the third section, in which there were 104 cars of 23 different makes.

Two manufacturers vied with each other in the matter of number of vehicles in line, these being the General Vehicle Company, Long Island City, N. Y., with G. V. electrics, and the Autocar Company, Ardmore, Penn., with Autocar gasoline cars, each being represented by over 40. The International Motor Company, New York City, was second with 25 Macks, 13 Saurers and nine Hewitts. These figures are taken from the list of entrants, and undoubtedly would need revision if an exact count of all the cars in line were available.

Other concerns which were favored by large representation were: The General Motors Truck Company, Detroit, Mich., G. M. C.; United States Motor Company, New York City, Sampson; Peerless Motor Car Company, Cleveland, O., Peerless; Couple-Gear Freight-Wheel Company, Grand Rapids, Mich., Couple-Gear electrics; Mais Motor Truck Company, Indianapolis, Ind., Mais; White Company, Cleveland, O., White; W. H. McIntyre Company, Auburn, Ind., McIntyre; Reo Motor Car Company, Lansing, Mich., Reo; Speedwell Motor Car Company, Dayton, O., Speedwell; Pierce-Arrow Motor Car Company, Buffalo, N. Y., Pierce-Arrow, and Victor Motor Truck Company, Buffalo, N. Y., Victor.

Special mention should be accorded to the two Martin tractors, made by the Knox Automobile Company, Springfield, Mass., which attracted considerable attention because of their peculiar appearance. Three G. V. electric crane trucks, of which the cranes were the most conspicuous feature, also were the subject of much favorable comment through the entire journey.

Besides the chiefs of divisions, Grand Marshal Curtis was assisted by the following aides: G. M. Curran, International Motor Company; D. D. Robinson, Baker electrics; R. R. Clayton, Studebaker Corporation; H. C. Brown, Sampson; F. B. Kutz, Pierce-Arrow; E. A. Bedell, B. F. Goodrich Company; N. Mallouf, Peerless; P. J. Dougherty, Detroit electric; F. W. Dix, Pope-Hartford; C. W. Wurster, Commer; E. O. Hoopgartner, Swinehart Tire & Rubber Company; J. M. Young, Chase; Melvin J. Adams, Alco; J. L. Breese, Jr., Commer; G. E. Anderson, Goodrich tires; A. L. Baringer, Sampson; G. L. Moore, Swinehart tires, and William H. Langford, Remington.

The accompanying table presents the list of official entries, although many other machines were included in the parade, as previously mentioned.

TESTING MARMON CARS.

While a Marmon car won the 500-mile internation sweepstakes race on the Indianapolis motor speedway, Memorial Day, 1911, the maker, the Nordyke & Marmon Company of Indianapolis, will have no entry in this year's event. However, stock 32 horsepower Marmons are now indulging in frequent brushes with the special racing cars in training for that contest. Of course the testers have orders from the factory not to compete with these machines, but the temptation is too strong, in most cases, and it is understood that in several instances the stock cars have been able to hold their own with credit.

Inasmuch as these cars are in no sense specially built speed creations, but regular stock models on their first complete running tests, the drivers feel particularly elated when they are able to pass the racers on the brick track. The Nordyke & Marmon Company has found that the two or three-day periods on the speedway track are of better service in giving a stringent test to the chassis, than twice that time spent in road work.

BIG MILEAGE WITH ALCO.

An interesting statement as to the mileage obtained from a touring car is noted in a recent letter to the American Locomotive Company, New York City, maker of Alco cars. The owner is Henry Vissering, president of a large railway supplies and equipment company in Chicago. He purchased his 40 horsepower car in 1907, and states that he has driven it 135,000 miles since that time.

During 1908, he drove this machine more than 10,000 miles in Europe, crossing the Alps and visiting various points of interest. He says that he has made it a practise to give it a thorough overhaul once a year and in that way keep it up to its maximum efficiency. In the matter of tires, he adds that two of the rear shoes each gave him nearly 10,000 miles of service.

JOINS EVERITT FORCES.

Announcement is made by the Metzger Motor Car Company, Detroit, maker of the Everitt line, that T. A. Peck has been appointed as manager of its technical department. Mr. Peck has been connected with the automobile industry practically since its inception, having left the machine shops of the Brown & Sharpe Manufacturing Company, Providence, R. I., many years ago. In addition to being an all around mechanic he is an expert gear cutter and is recognized as an authority on all technical matters, having contributed generally to the motoring magazines.

Bridgeport Club Elects Officers—The following officers have been elected for the ensuing year by the Automobile Club of Bridgeport, Conn.: President, Frank T. Staples; vice president, Ralph M. Sperry; secretary, Herbert M. Lyon; treasurer, L. B. Powe; board of governors, George F. Bushnell, G. S. Hadley, John E. Boyle, F. A. Strong, F. D. Baker and A. K. L. Watson.

LINSCOTT GOT HIS REOS.

Probably one of the most ingenious schemes ever carried through for securing the use of railroad freight cars, during a shortage recently, was put into execution by J. M. Linscott of the Linscott Motor Company, Boston, agent for Reo cars in that city and vicinity. During the Boston show, and for several days thereafter, Mr. Linscott was busy signing up orders for Reos, made by the Reo Motor Car Company, Lansing, Mich. The difficulty came in securing freight cars in which to ship the machines from the factory.

After spending a small fortune in telephone and telegraph charges, he located 25 40-foot box cars, only to learn that these would not be shipped to Lansing unless they were loaded. "Oh, that is easy," replied Mr. Linscott. "You get the box cars ready and I'll see to loading them."

Shortly, the 25 cars were lined up in the Boston freight yards, and almost immediately thereafter they were loaded with empty barrels purchased by the Linscott Motor Company. These were sent to R. M. Owen & Co., general distributor, at Lansing, charges prepaid, with positive instructions that when the barrels were unloaded the cars were to be filled promptly with Reo the Fifths and shipped back to Boston. It may be added that the scheme worked out exactly as planned.

SPLITDORF SERVICE STATIONS.

The manufacturers of automobile equipment and accessories are following the example of the car makers in establishing service stations throughout the country, where users of their product may receive the assistance of skilled workmen in obtaining new installations, repairs or replacements, and where a large stock of goods and spare parts is maintained. Charles F. Splitdorf, New York City, maker of Splitdorf magnetos and other ignition equipment, has adopted this method and such service stations have been located in New York, Chicago, San Francisco, Detroit, Boston, Los Angeles and Kansas City. It is announced that others will follow, among them being those located in connection with the foreign branches in London, Paris, Turin, Brussels and Johannesburg.

MOTOR MAGAZINE OF CANADA.

One of the most interesting motoring publications in Canada is the Motoring Magazine of Toronto. A recent change in management is noted with the April issue, in that it is to be published in the future by H. Gagnier, Ltd., whose many publications are of that standard of excellence which guarantees that this journal is setting out on a new career of broader scope and usefulness than it has enjoyed hitherto. The April number appears in new dress and the contents are such as to indicate that the new management is to present features of even more timely interest than has been true in the past.

LYNN DEALERS ACTIVE.

The members of the Lynn Automobile Dealers' Association, Lynn, Mass., have decided that in the future they will not accept second hand cars as part payment on new machines. Cut price rates on automobile sundries are also looked upon as a special weakness in the local field, and while no definite action has been taken, this matter is under advisement.

WITH PAIGE-DETROIT CARS.

The many friends of O. R. Hardwell, both in and out of the industry, will be glad to learn of his appointment as advertising and publicity manager for the Paige-Detroit Motor Car Company, Detroit. He assumed his new duties April 1, and under his direction the exploitation of Paige-Detroit cars will be pressed with increased vigor throughout the coming season.

Mr. Hardwell was born in Toronto, Can., and was for five years a newspaper reporter in Montreal and Canada before taking up advertising work. He spent one year as advertising manager of the Canada Cycle & Motor Company under the direction of E. R. Thomas, and another year in Detroit as publicity writer. From Detroit he went to Chicago, where he spent three years with two of the largest national advertisers in the country. About 18 months ago he joined the force of the Charles H. Fuller agency in Chicago, and six months later returned to Detroit to take charge of several automobile accounts with this agency in that city.

O. R. Hardwell, Advertising Manager Paige-Detroit Car Co.

In selecting Mr. Hardwell, Henry Krohn, sales manager of the Paige-Detroit company, had in mind his thorough knowledge of the advertising media of the country, as well as his ability to prepare successful advertising copy. It will be seen that his experience has been wide and his understanding of the needs of the industry is such as to place him in the front rank. There is little doubt that under his management the combined department will be one of the most efficient in the country.

NATIONAL CONTEST AND RACING NEWS.

Entries for Santa Monica Races---Reorganization of the Contest Board---Memorial Day Events at Salem, N. H.---Indianapolis 500-Mile Race---Other Notes.

The importance of the road races at Santa Monica, Cal., May 4, is better understood when it is remembered that at both of the previous meets held over this course, new records have been made. Because of this fact, it is generally conceded that the Santa Monica course is the fastest in America, if not in the world. However, the contests have been held in the fall, heretofore, and it remains to be seen what effect it will have upon the speed of the contending cars by changing the date to one of late spring or early summer. Of course, climatic conditions are by no means the same in southern California as in other sections of the country, and the motoring world expects that the event of May 4, will reveal even greater speed than has been seen anywhere heretofore.

One of the Stutz Cars, a California Favorite in the Santa Monica Road Races of May 4.

Teddy Tetzlaff in a Lozier created a new American road record in the fall of 1910, covering the distance at a speed of 73.22 miles an hour. At that time Felice Nazzaro held the world's record at 74.3, having driven a Fiat car over the Targa Florio course in Italy in 1908. This mark was exceeded twice in the Santa Monica races of Oct. 14, 1911. Charles Merz drove a National car at the rate of 74.42 and Harvey Herrick now holds the world's record with another National at 74.62. This is the mark which the winner of next week's race is expected to exceed.

Several well known drivers are looked upon as probable entries for the event. The list closes at midnight, April 25, and there may be some changes from that which was announced a few days ago by Manager A. M. Young of Los Angeles. This includes the following: David L. Bruce-Brown, Fiat; Ralph De Palma, Mercer; Bert Dingley, Simplex; Teddy Tetzlaff, Fiat; Caleb Bragg, Fiat, Erwin Bergdoll, Mercer; Barney Oldfield, Fiat; Charles Merz, National; Louis Disbrow, Case; Joseph Nikrent, Case; David Lewis, Stutz; Earl Cooper, Stutz; Earl Devore, Buick, Frank Siefert, Midland—besides, two E-M-F's, two Fords, two Cinos, a Maxwell, K-R-I-T, Regal, Reo, Pathfinder and Flanders for which no drivers have been named as yet.

There will be three races, all run at the same time, the major event being the free-for-all for 202 miles, the award in which is the Ferris cup. The event for cars of 301-450 cubic inches piston displacement will be for 151.5 miles, the prize being the Shettler cup. The Chanslor & Lyon trophy will go to the winner in the 101-mile contest for cars of 161-230 cubic inches. There also will be cash awards.

It appears that the recent commutation of Barney Oldfield's disqualification to expire April 30, was made by the contest board of the American Automobile Association upon the earnest solicitation of Manager Young. It had been supposed that his suspension was lifted in order that he might take part in the 500-mile race at the Indianapolis speedway May 30. Manager Young brought the matter to the attention of E. G. Kuster, the southern California representative on the contest board, who wired the headquarters in New York while the board was in session, and the favorable action was taken immediately. His suspension would have expired by limitation July 1.

SECOND ANNUAL FOUR-STATES TOUR.

The Indiana Automobile Manufacturers' Association has completed arrangements for its second annual Four-States tour, which will cover 1264 miles and last 15 days. Following the plan inaugurated last year abundant opportunity will be had to make this event an advertising campaign. The tour is limited to cars produced in the State of Indiana, and the tentative itinerary follows:

July 9, Indianapolis, Noblesville, Kokomo, Wabash, Huntington and Fort Wayne, Ind.; 10, Van Wert and Lima, O.; 11, Fostoria, Fremont and Tiffin, O.; 12, Bucyrus, Mansfield and Wooster, O.; 13, Massillon and Akron, O.; 14, Sunday in Akron; 15, Canton, O., and Wheeling, W. Va.; 16, Cambridge, W. Va.; and Zanesville, O.; 17, Newark and Columbus, O.; 18, Lancaster, Circleville and Chillicothe, O.; 19, Portsmouth and Ironton, O.; Catlettsburg, Ky., and Huntington, W.

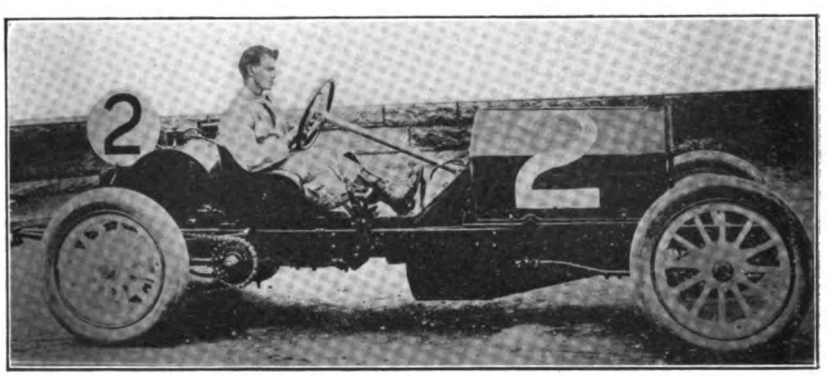
Digitized by Google

Va.; 20, Kenova, W. Va.; Catlettsburg, Ky.; Ironton and Portsmouth, O.; 21, Peebles, O., and Maysville, Ky.; 22, Paris, Winchester and Lexington, Ky.; 23, Frankfort, Shelbyville and Louisville, Ky.; 24, Jeffersonville, Seymour, Columbus and Indianapolis, Ind.

SCHIMPF REMAINS AS CHAIRMAN.

William Schimpf, formerly president of the Long Island Automobile Club, Brooklyn, N. Y., who took the office of chairman of the contest board of the American Automobile Association upon the death of Samuel M. Butler, has acceded to the request of President R. P. Hooper and officials of the Manufacturers' Contest Association and will remain at the head of that committee during the 1912 season. He is an amateur and having served on the board for the past year is thoroughly conversant with his duties.

Recent conferences between American Automobile Association and Manufacturers' Contest Association officials have resulted in a renewal of the contest relations of these two organizations, with some slight but essential changes in the agreement. The contest board is composed of 12 members and is supplemented by an advisory committee and representatives from each state as follows:



Contest board—William Schimpf, chairman; H. W. Knights, Boston; Frank G. Webb, New York City; P. D. Folwell, Philadelphia; Joseph H. Wood, Newark, N. J.; Charles I. Ryan, Atlanta, Ga.; David Beecroft, Chicago; Frank M. Joyce, Minneapolis, Minn.; R. W. Carr, San Antonio, Tex.; Ralph W. Smith, Denver, Col.; P. J. Walker, San Francisco.

Advisory committee—S. A. Miles, National Association of Automobile Manufacturers; Jesse Froehlich, importers; H. A. Bonnell, Automobile Board of Trade.

State representatives—Alabama, A. M. Kennedy, Montgomery; Arizona, G. P. Bullard, Phoenix; northern California, P. J. Walker, San Francisco; southern California, Edward G. Kuster, Los Angeles; Colorado, Ralph W. Smith, Denver; Connecticut, C. H. Gillette, Hartford; Delaware, Henry M. Taylor, Wilmington; Florida, H. B. Race, Jacksonville; Georgia, C. I. Ryan, Atlanta; Idaho, R. W. Spangler, Twin Falls; Illinois, D. Beecroft, Chicago; Indiana, C. W. Sedwick, Indianapolis; Iowa, C. A. Kneedler, Sioux City; Louisiana, P. M. Milner and T. C. Campbell, New Orleans; Maine, D. W. Hoegg, Jr., Portland; Maryland, Dr. H. M. Rowe, Baltimore; Massachusetts, H. W. Knights, Boston; Minnesota, Dr. C. E. Britton, Minneapolis; Mississippi, Robert B. Bridge, Natchez; Missouri, W. P. M. Stevens, Kansas City; Nebraska, W. D. Hosford, Omaha; New Hampshire, C. M. Floyd, Manchester; New Jersey, Joseph H. Wood, Newark; New York, Frank G. Webb, Brooklyn; North Carolina, James R. Gray, Jr., Winston-Salem; North Dakota, W. J. Price, Fargo; Ohio, Nelson B. Ruggles, Columbus; Oregon, H. L. Keats, Portland; Pennsylvania, P. D. Folwell, Philadelphia; Rhode Island, Charles E. Doe, Providence; South Carolina, A. McP. Hamby, Columbia; South Dakota, H. C. MacCoshen, Watertown; Texas, R. W. Carr, San Antonio; Vermont, W. W. Brown, Springfield; Virginia, Dr. H. W. Bassett, Richmond; Washington, F. M. Fretwell, Seattle; West Virginia, T. A. Westmyer, Wheeling; Wisconsin, George A. West, Milwaukee.

BOSCH MAGNETO PRIZES.

In addition to the prizes awarded by the management of the road race at Santa Monica, Cal., May 4, and the 500-mile race on the Indianapolis speedway, May 30, the Bosch Magneto Company, New York City, maker of Bosch magnetos and spark plugs, has followed its usual custom in announcing special rewards for the drivers of cars fitted with its ignition devices. In the California event these prizes are to be divided as follows: Free-for-all, $200 to winner of first place, $100 for second and $50 for third; 301-450 cubic inches, $100 for first, $75 for second and $50 for third; 161-230 inches, $100 for first, $75 for second and $50 for third. In the 500-mile race the winner will receive $500; the holder of second place $300, and the third place man $200.

Bert Dingley in S implex with Which He Will Appear in Santa Monica Road Races Next Month.

QUAKER CITY ROADABILITY RUN.

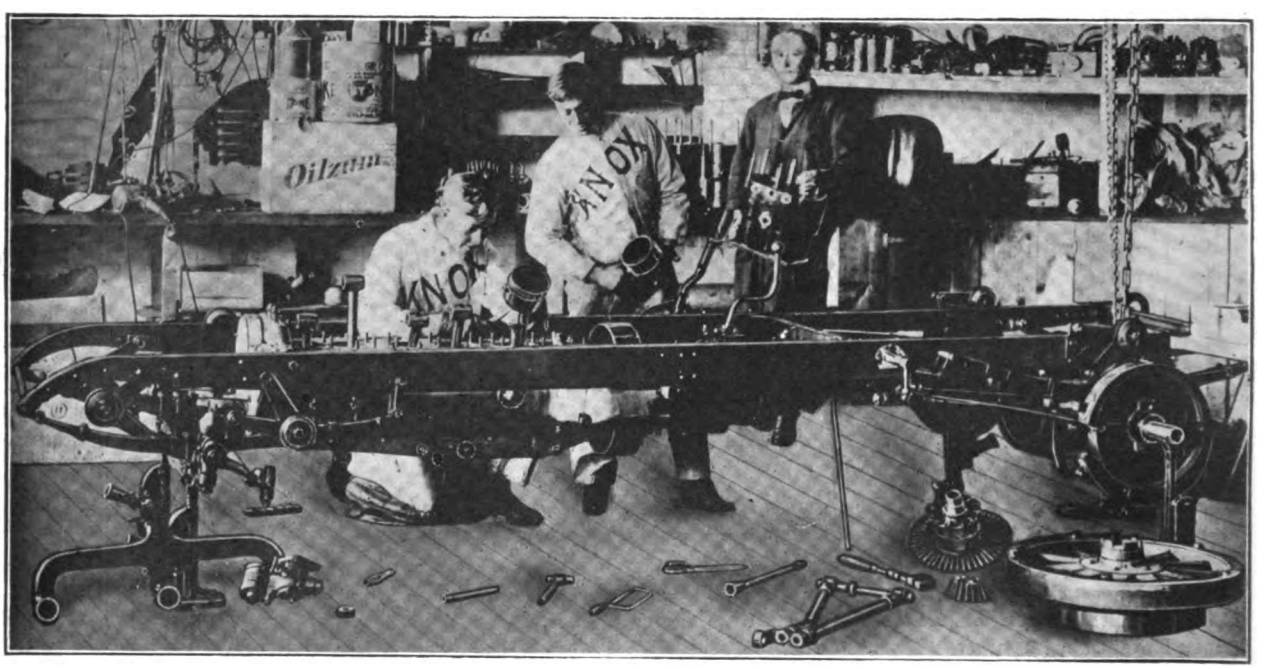
The annual roadability run of the Quaker City Motor Club, Philadelphia, Penn., will be held April 27, the destination being Atlantic City, N. J. This will not only mark the official opening of the Philadelphia motoring season, but it also will prove the first club run held in the Mosquito state since the lifting of the ban against non-resident motorists. There will be a change in the features which have marked previous events of this character, in that a fuel economy test will be inaugurated. The main contest will consist of an effort to arrive in Atlantic City the nearest

Digitized by Google

to a secret time schedule agreed upon by the committee. The fuel economy feature will be based upon the consumption of a standard gasoline, furnished by the committee, the consumption in ounces to be divided by the gross weight of the car.

ROCKINGHAM PARK RACES.

There will be 10 events on the card at the Memorial Day race meet at Rockingham Park, Salem, N. H., three of these being reserved for amateurs. Entry blanks are now in the hands of Harry H. Knepper, 47 Massachusetts avenue, and James F. Kerr, 67 Milk street, Boston. The list of events and prizes follows:



Five miles, class C, 161-230 inches, non-stock, $75, $20, $15; five miles, class C, 231-300 inches, non-stock, $75, $35, $15; five miles, class C, 301-450 inches, non-stock, $75, $35, $15; five miles, class C, 451-600 inches, non-stock, $75, $35, $15; 10 miles, free-for-all handicap, amateurs, non-stock, $75, $35, $15; 50 miles, two races at the same time, class E, 161-300, 301-600 inches, non-stock, $75, $35, $15, and $125, $50, $25; 10 miles, free-for-all handicap, class D, non-stock, $75, $35, $15; mile time trials, $50, $25, $15; five miles, class C, 161-300 inches, amateurs, non-stock, $50, $20, $10; five miles, class C, 301-600 inches, amateurs, non-stock, $75, $35, $15.

ALL IOWA ENDURANCE TRIALS.

A tentative route for the all Iowa endurance run of the Iowa State Automobile Association, which will be held some time in June, has been decided upon, and plans are under way for the selection of a path-finding car. The route will start from Des Moines, following the river-to-river road to Council Bluffs, thence across the river to Omaha, where the tourists will be entertained by members of the Omaha Automobile Club. Upon returning to the Iowa side, the tour will proceed to Sioux City, from which city the northern cross-state road will be followed to Dubuque and Keokuk, thence back to Des Moines over the old Waubonsie trail.

INDIANAPOLIS' 500-MILE RACE.

All rumors concerning the possibility of calling off the second 500-mile race on the Indianapolis motor speedway, scheduled for May 30, are set at rest by the following announcement from C. E. Shuart, representing the speedway management: "We beg to call your attention to the fact that our entries for the next 500-mile race close at midnight, May 1, and positively no entries will be received after that time." The race will take place as scheduled, unless the weather forbids, in which event it will be held Saturday, June 1, as stated in the entry blanks issued by the management.

Ralph Mulford Busily Engaged in Preparing His Privately Owned Knox Car for the 500-Mile Indianapolis Speedway Race of Memorial Day.

It is stated that the management has the promise of at least 25 cars, and it is expected that this list will be swelled to 30 before the closing date. The following are already entered:

Stutz, Gilbert Anderson; Stutz, Leonard Zengle; National, Donald Herr; National, Howard Wilcox or Charles Merz; Mercedes, Spencer Wishart; Mercedes, Ralph De Palma; Case, Harvey Herrick; Case, Louis

Digitized by Google

Disbrow; Fiat, Teddy Tetzlaff; Lexington, Harry Knight; Cutting, Robert Burman; Simplex, Bert Dingley; Knox, Ralph Mulford; White, W. Barndollar; Firestone-Columbus, Lee Frayer; Continental, John Jenkins; Buick, William Liesaw.

WOLVERINE CLUB REMY GUEST.

More than 150 tourists, members of the Wolverine Automobile Club of Detroit, will be the guests of the Remy Electric Company, Anderson, Ind., maker of Remy ignition and lighting equipment, during the tour of that organization to witness the 500-mile race at Indianapolis, May 30. The club will leave Detroit at 8 in the morning of May 28, and the first day's run will take the contestants to Fort Wayne, Ind., where they will be the guests that night of S. F. Bowser & Co., maker of Bowser gasoline storage systems and tanks.

They will be met in Fort Wayne by F. E. Moskovics, sales manager of the Remy company, who will pilot them to Anderson, the noon control, May 29. After a stop of two hours, during which they will inspect the Remy plant, and be served with a lunch under a mammoth tent, they will leave for Indianapolis where they will be the guests of the Hoosier Motor Club.

OLD ORCHARD BEACH MEET.

The Old Orchard Automobile Association, which was organized last fall to promote this year's beach races at Old Orchard, Me., has elected Frank Mowry chairman of its contest board. He is at work upon the entry blanks and expects to have them ready for mailing within a few days. The event will take place July 4-6, and already more than 25 cars have been promised.

BOSCH IN TOUR DE FRANCE.

Of the 40 cars finishing with a perfect score in the automobile tour de France, under the auspices of L'Auto of Paris last month, 33 were equipped with Bosch magnetos, made by the Bosch Magneto Company, the American offices of which are located in New York City. This is a percentage of 82.5, which is all the more interesting when it is known that of the 62 cars which started, only 66.1 per cent. were Bosch equipped.

NEW ORGANIZATION IN MAINE.

Following a banquet in the interest of good roads at Rockland, Me., early in the month, the Knox County Automobile & Good Roads Association was organized and will be affiliated with the Maine State Automobile Association. The following officers have been elected: President, A. S. Littlefield; vice president, L. M. Littlehale; secretary and treasurer, H. N. McDougall.

COMING EVENTS.

April.

April 27—Speedway meet, Los Angeles, Cal.
April 27—Roadability run, Philadelphia, Penn.
April 29-May 4—Show, Burlington, Vt.

May.

May 4—Hill climb, Atlanta, Ga.
May 4—Road race, Santa Monica, Cal.
May 12—Track events, Salt Lake City, Utah.
May 14-17—Commercial vehicle test, Chicago, Ill.
May 17-18—Track events, Denver, Col.
May 25—Road race, Barcelona, Spain.
May 30—500-mile race, Indianapolis, Ind.
May 30—Track events, Salem, N. H.

June.

June 6—Reliability run, Washington, D. C.
June 8—Track events, Narberth, Penn.
June 20—Algonquin hill climb, Chicago, Ill.
June 20-22—Reliability run, Portland, Me.
June 25-26—Grand Prix, Dieppe, France.

July.

July 3-5—Track events, Belle Fourche, S. D.
July 4—Track events, Petersburg, Ind.
July 4-5—Track events, Taylor, Tex.
July 4-6—Beach events, Old Orchard, Me.
July 5-6—Road race, Tacoma, Wash.
July 15—Reliability run, Wisconsin.

August.

Aug. 8-10—Beach races, Galveston, Tex.
Aug. 23-24—Stock car races, Elgin, Ill.

September.

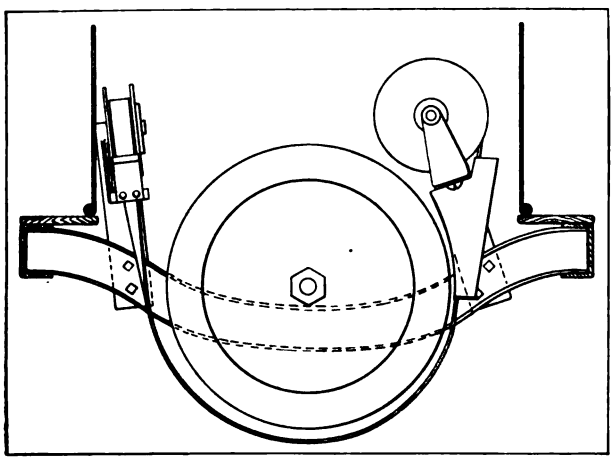
Sept. 2—Speedway meet, Indianapolis, Ind.
Sept. 9—International aviation race, Chicago, Ill.

October.

Oct. 5—Fairmount Park race, Philadelphia, Penn.
Oct. 7-11—Reliability run, Chicago, Ill.
Oct. 12—Track events, Salem, N. H.

November.

Nov. 6—Track meet, Shreveport, La.



AUTOMOBILES IN PUBLIC SCHOOLS.

If the present plans of Mayor Fitzgerald of Boston materialize, the high school pupils in that city will have opportunity to study the construction and operation of automobiles. The school committee has informed him it will be glad to hear from him further regarding the suggestion, and it is understood that the board is now considering the advisability of arranging for classes in South Boston, Roxbury and in one of the schools in the city proper.

Digitized by Google

RECENT DEVELOPMENTS IN SELF-STARTERS.

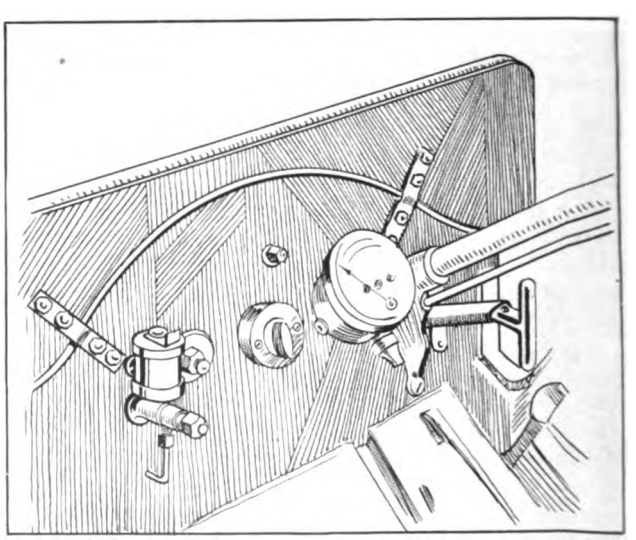
OF THE making of self-starters, like the making of books, there appears to be no end. Since this series of articles was begun in the issue of The Automobile Journal for Dec. 25 something over 40 differ-

Sectional Drawing to Illustrate Construction of Panwood, Jr.

ent devices have been described and illustrated. A careful perusal of the Patent Office Gazette will reveal the fact that new inventions of this character are appearing on an average of at least six or eight a month. In view of these facts, it is not at all surprising that motorists are becoming decidedly interested in the subject of self-starters.

It will be remembered that included in the list of devices described heretofore was a Panwood acetylene starter, produced by the Panwood Manufacturing Company, Grand Rapids, Mich. Announcement is now made of the Panwood, Jr., illustrated herewith, which is being marketed by this concern for use on the Hupmobile, Paige-Detroit, K-R-I-T, and several makes of two-cylinder cars, it being designed as a simple and efficient device to start motors which are equipped with magnetos only.

The Panwood, Jr., consists of two distinct parts, the pull or engine rotator and the primer. By this it will be seen that the device is to be placed in the so-called mechanical class, although it goes a step further than most of these. It is understood that the company has been experimenting with the principles involved for the past two years.



The starter proper is operated on the principle of giving the engine a complete half-turn, and it is expected that this will be sufficient to provide a start every time. However, as the leather strap which imparts the turning movement to the motor is returned automatically to its original position, as many trials may be made as desired. The primer is an auxiliary for use in case it is deemed necessary to supply the motor with a slightly richer mixture.

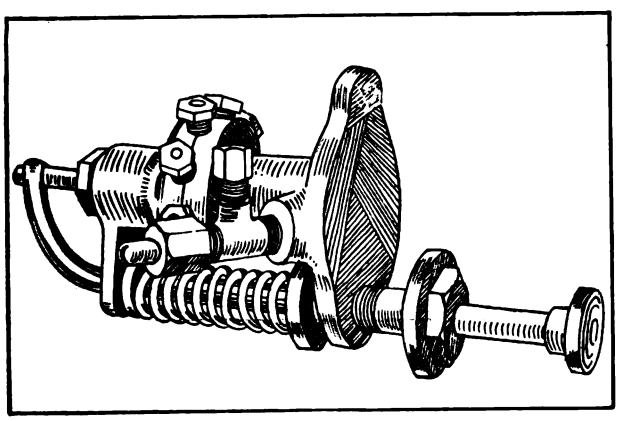
The pull device consists of a leather strap about 1.25 inches wide, which is held by a coil spring as shown in the sectional drawing, at the left hand side of the flywheel. The strap is passed under the flywheel and thence to the dash over a second pulley on the opposite side, which also contains a spring designed to assist in returning to its original position. Nothing shows on the dash but a small brass handle usually located under the steering column.

This statement has reference simply to the starter proper. Of course, the priming member, which is a small glass receptacle, also is located on the dash. From this a pipe leads to the engine manifold. The primer is operated by a valve which is opened by the pressure of the foot, and provision is made for the removal of this push button so that the device cannot be tampered with when the machine is left unattended.

Another new acetylene starter is the Meteor, made by the Meteor Auto Tank Company, 1666 Broadway, New York City, and designed for use in connection with the well known Meteor gas tank, although its use is not restricted to tanks of that make. It combines some of the features seen in other productions, in that it delivers the acetylene mixture to a specially designed priming cup in each cylinder and the intake manifold as well. However, unlike some of the devices which deliver the mixture to the intake manifold, the Meteor is designed to charge the cylinders only when the start is to be made, and not on the dying revolutions of the motor.

The construction is set forth in an accompanying drawing, which shows the various parts and their rela-

Dash Fitted with Panwood, Jr., Indicating Starting Handle and Priming Device.



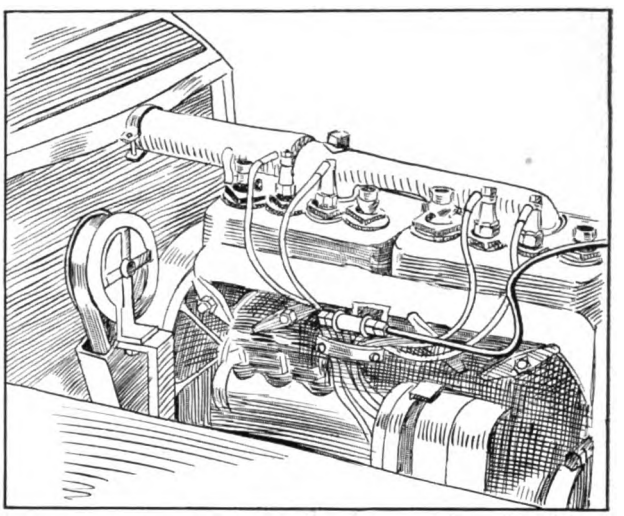
tion to each other. It will be noted that a two-way valve is attached to the gas tank, one of the leads controlling the supply of gas to the lights and the other going directly to the distributing valve located

Digitized by Google

on the dash. This distributor is shown in front, side and rear views at the top of the drawing, pipes leading from this to the individual priming cups, one of which is shown detached, and to the inlet manifold. It may be stated that the original priming cup on the engine is replaced by a simple check valve in which the starter priming cup is inserted. Suitable means are provided, as may be seen from the regulating valve in the centre of the rear view of the distributor, for increasing or diminishing the quantity of acetylene supplied in the mixture.

When ready to start, the handle on the distributor, which is the only exposed portion of the device, the remainder of the distributor being located on the dash under the hood, is turned according to directions, and the required amount of gas is automatically injected into the cylinder or cylinders about to fire. At the same time, a suitable mixture is fed to the inlet manifold. A spark is then created in the usual manner and the engine is started.

The Auto Starter Company of Milwaukee, Wis.,



Plunger and Distributor on E. Z. Aceteylene Self-Starter.

has introduced the E. Z. acetylene device, the plunger and distributor of which is shown herewith. This does not differ materially from others which have been described, except in the formation of the distributor. A special two-way valve is attached to the regulation gas tank, one lead of which controls the flow to the lights and the other to the distributor located on the dash.

This latter consists of a spring seated valve operated by a foot button plunger. The various outlets for the leads to the several cylinders of the motor are to be noted in the drawing, the lead from the gas tank being at the extreme end of the line of openings. Just above the spring will be seen the air inlet, by means of which the proper proportioning of air and acetylene is performed in the distributor, before the charge is injected into the cylinders through a special priming cup and valve, replacing the regular priming device on these members.

When it is desired to start the motor, the plunger is pushed in to the limit of its throw, and immediately allowed to come back to its original position,

Location of Panwood, Jr., Primary Pulley with Leather Strap Running under Flywheel, and Priming Connection with Intake Manifold.

through the action of the spring. This allows a measured amount of acetylene and gas to flow into each cylinder. Starting is then accomplished by throwing the switch to the battery position and causing a spark to be shot across the gap of the spark plug in the cylinder about to fire.

RECORD MARCH PRODUCTION.

According to the Studebaker Corporation, there were manufactured in its E-M-F factories at Detroit during March an almost equal number of E-M-F and Flanders machines to a total valuation of $4,276,000, which is claimed to set a new record in automobile production. Across the Detroit river, at Walkerville, Ont., the Canadian branch increased this figure by an output valued at $325,000, making a grand total of $4,601,000 for the month.

MECHANICAL NOTES FOR OWNERS

Methods of Simplifying the Care and Maintenance of the Car, Discussion of Pertinent Facts and Notes on Operation.

ADJUSTING VIBRATING COILS.

The motorist who thoroughly understands the vibrating spark coil is the exception rather than the rule. Many are able to adjust these members to obtain the desired results but few are capable of removing the exposed components such as the bridge, vibrator spring, etc., and reassembling the parts correctly. The general use of magnetos has led the present day automobilist to consider the coil incorporated in the system as an auxiliary member, and as a result it does not receive the attention it requires.

With low-tension magnetos the current is built

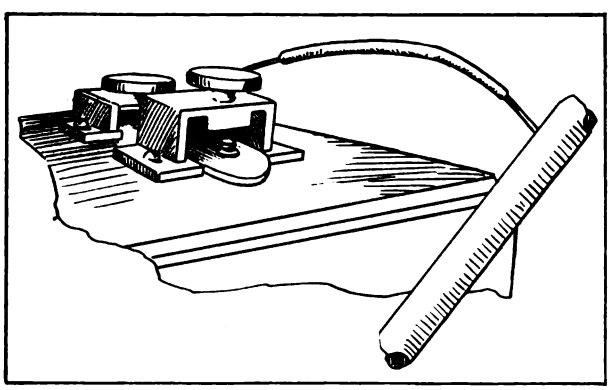

Fig. 1—Simple and Efficient Method of Adjusting Units of Spark Coils.

up or strengthened by the coil and when the latter is of the vibrating type and employed for starting the motor with current furnished by a storage battery or dry cells, it is essential that the platinum points be clean and adjusted properly. Many instances of hard starting are due to these conditions although a weak battery should be considered. Experienced motorists who operated cars before the magneto became generally used, became quite proficient in the care of vibrating coils and secured the maximum efficiency from these members, and effected a decided saving of current.

At Fig. 1 is outlined a conventional unit of a vibrating coil and it will be noted that the components consist of two bridge like members each carrying a knurled screw. Both are secured to the coil plate by small screws permitting removal for inspection and cleaning. The smaller bridge holds the vibrator spring which is fitted with a platinum point and the latter is in contact with a similar piece of metal integral with the adjusting screw in the larger bridge. Directly under the vibrator is the iron core which attracts and releases when current is passing through the coil.

It is obvious that if the vibrator is some distance from the core more current will be required to attract it, also if the contacting platinum points be pitted or burned the resistance in the circuit is increased greatly. If the contact screw be moved down to produce the necessary spark at the gaps of the spark plugs, additional current will be required.

These components should be examined, cleaned and adjusted from time to time and this work is performed easily. The larger bridge member may be displaced by taking out the screws holding it to the base which will disclose the core. If the cover does not fit accurately, or in such manner as not to exclude dampness, it will usually be found rusty. It should be cleaned and covered with a little grease, taking care not to use too much of the lubricant.

If the vibrator spring has lost its elasticity, a new one may be fitted and adjusted according to the type of coil; that is, the space between it and the core regulated as by the instruction book of the maker. The platinum points if worn to the edge of the other metal may be renewed by some jeweller dealing in platinum, or new screws may be purchased. A file is a poor tool for removing pits as too much of the metal is apt to be wasted. By utilizing a piece of fine emery paper as outlined recently in The Automobile Journal the contacts may be smoothed up without disassembling the parts.

In adjusting the coil it is not necessary to turn the motor over until the vibrator buzzes. The tuning up may be accomplished easily as shown in the sketch by attaching one end of a piece of wire to the steer-

Digitized by Google

ing column and placing the other on the adjusting screw. Each unit may be treated in a similar manner. This kink will be found handy when testing out spark plugs in connection with a four-cylinder spark coil or those of dual units.

HANDY WRENCH KINK.

In attempting to remove a nut or bolt which has been set up snugly and which will not yield to treatment with an ordinary monkey wrench, the inexperienced workman is apt to employ a cold chisel or a large Stillson wrench. This results in damage to the part and is poor practise. At Fig. 2 A is presented a method which has been tried with success by the writer who has started nuts which refused to budge with ordinary tools.

The small monkey wrench is set up snugly upon the part, and gripped by a Stillson as shown in the drawing. It is obvious that the Stillson should be considerably larger in order to obtain the desired leverage. If the tool be of medium size and has an all metal handle, a piece of gas piping may be slipped over the handle. When pressure is applied the leverage exerted is immense and the most obstinate nut will yield to the treatment.

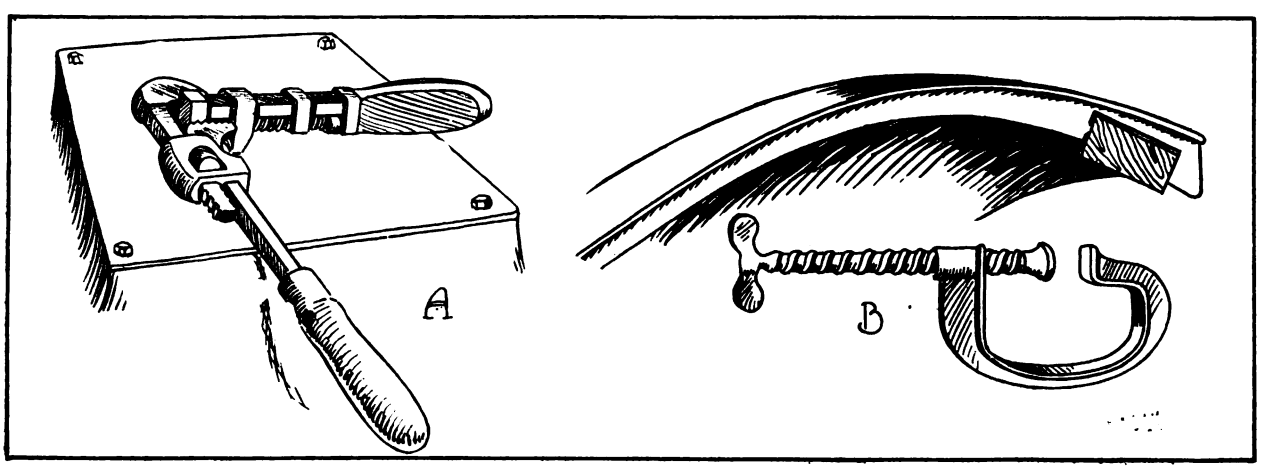

Fig. 2—Suggestions to the Owner to Facilitate Repairs: A, Depicting Combination of Stillson and Ordinary Wrench to Start Stubborn Nut; B, Outlining a Simple Method of Removing Indention in Fender.

STRAIGHTENING OUT BENT FENDERS.

When fenders become bent the usual practise is to remove them and take them to a tinsmith for repairs. This involves considerable trouble and delay. The average fender may be straightened out by taking a block of wood or a strip of metal and placing it on the damaged part as outlined at Fig. 2 B. A clamp is then attached and when screwed up the kink in the metal will be eliminated. While some of the paint will crack, the fender will present a much better appearance than if it were straightened by hammering.

HOW TO SELECT FILES.

The proper use of a file would appear simple but the early efforts of the novice prove otherwise. In his first attempts he is apt to use the first file that comes to hand, sawing backward and forward with equally heavy pressure, but he will soon discover that a tool cuts on the forward stroke only, and that if he relieves the pressure on the return movement he will husband his strength, and the teeth of the file also. In time he will buy 12-inch files and be particular as to the use to which they are put. It is poor practise to employ a new file for work on solder. These members when new and fine should be reserved for brass and similar metals. To file well is quite an accomplishment, as the novice will probably note after surveying his attempts to obtain a smooth and even surface.

In purchasing a file it should be balanced on one finger midway of its length, and struck lightly with some hard body. If the tool be a good one it will ring almost like a tuning fork. The file should next be held nearly level with the eye, the light falling obliquely up its teeth, which should present a perfectly regular and even appearance viewed from either end. The color should be a dull, silvery gray, free from spots or mottling, except at the end or tang, where it is tempered. Files should be kept in a rack by themselves, and should not be thrown in a drawer among other tools, and if a file or two be carried on the car, they should be wrapped separately in paper or cloth to prevent injury to their teeth.

INSTALLING DRY CELLS.

It is a common occurrence for motorists to find fault with dry cells when experiencing ignition troubles, especially in starting. The difficulty is due usually to careless installation of the batteries and this will apply equally well to the storage type. The prevalent use of metal battery containers, and especially where

Digitized by Google

these are not lined, will breed trouble for the operator if he tumbles the cells in and does not take precautions to prevent their jumbling about. If the cover of the box is not fitted with wood the cells should be packed in tightly with newspapers or waste and covered with this or other non-conducting material.

Dry cells should not be placed in a box in which a storage battery has been used previously until the interior has been scrubbed thoroughly to remove all traces of acid, otherwise the zinc of the cells will be attacked and destroyed quickly. Instances are known where a number of dry cells have been destroyed within a few days by the acid left in the battery box in which a storage battery was used formerly.

When individual dry cells are employed care should be exercised in washing the car, so that the batteries

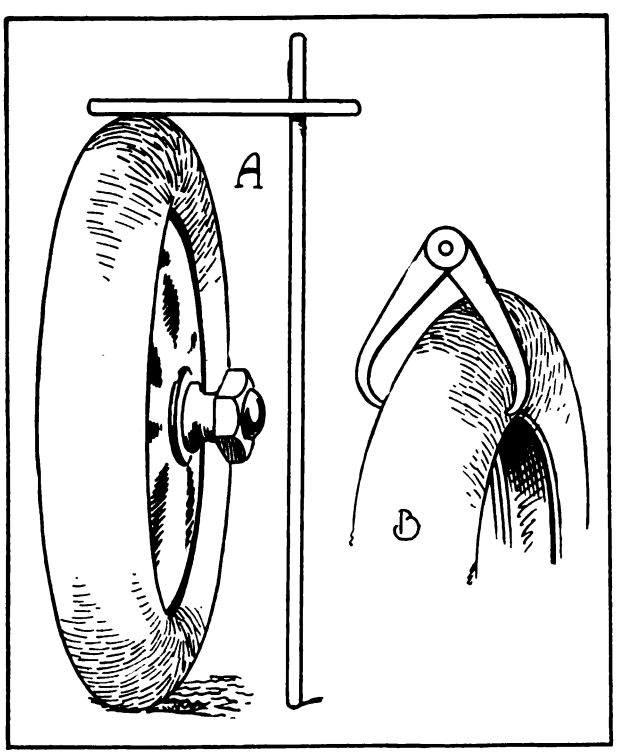

Fig. 3—Indicating How Tires May Be Measured: A, Determining Circumference; B, Utilizing Calipers to Secure Diameter.

and the interior of the box are not wet. This is apt to cause a leakage of the current, which will soon render them useless. The same will apply to containers which do not exclude the rain.

HOW TO MEASURE TIRES.

It is surprising to note the number of operators who purchase second hand tires to tide them over the latter part of the riding season and some make it a practise to take advantage of bargain sales. As the name of maker and sometimes the size is buffed off or removed, the purchaser has no accurate means of knowing whether he is obtaining full measure for his money. A simple method of measuring tires is outlined at Fig. 3. The circumference of the shoe may be ascertained readily by using two strips of wood, as shown in the drawing. The diameter is obtained by employing a pair of calipers, and the method of securing the measurement and proper location of the instrument are also depicted.

ATTACHING LICENSE PLATES.

In these days when the police are enforcing the automobile laws, especially those relating to the license tags, it is an excellent idea for the novice to give some thought and attention as to how to affix the plates. The use of straps and wires is not recommended as the material will chafe and the numbers become lost, which may mean a visit to the police court where explanations are not heeded.

Some make it a practise to fasten the tags to the front of the radiator by means of wires passed through this member. This is a poor plan, for should the wire or rods become loose, the vibration will cause them to chafe a hole in the fins of the cooler and a leaky member is the result.

There are several devices upon the market for carrying the license plates, one being so constructed that it is affixed to the radiator filler tube and when two numbers are required the other appliance is made to fit over the tail light bracket.

The front number may be secured to the axle by making two clamp like strips of metal and fitting these with threaded bolts and nuts. The fasteners should be made smaller so that in drawing the plate against the axle the former will be held securely and will not vibrate. Another method is to bolt the plate to the strip of metal extending below the radiator which covers up the lower part of the crankcase.

Many owners object to placing the rear number upon the body as it necessitates drilling holes. The sign may be located on the fender by means of angle irons or the rear cross frame drilled to take similar holders. If the tags are suspended by straps or wires from the tierod they should be so secured that the plate will not slide as it might become jammed against the starting handle and prevent proper operation of the steering mechanism.

NEW CARTERCAR CATALOGUE.

The publication of automobile catalogues from year to year is becoming an art in itself. The latest issue, presenting the merits of 1912 Cartercars, made by the Cartercar Company, Pontiac, Mich., is particularly interesting because it sets forth in a thoroughly effective manner the wonderful progress that has been made in the product of that concern since the first Cartercar left the factory in 1901. The illustrations are quite in keeping with the machines themselves and the text matter sets forth the advantages of these cars in an able manner. A copy will be mailed upon request made to the company.

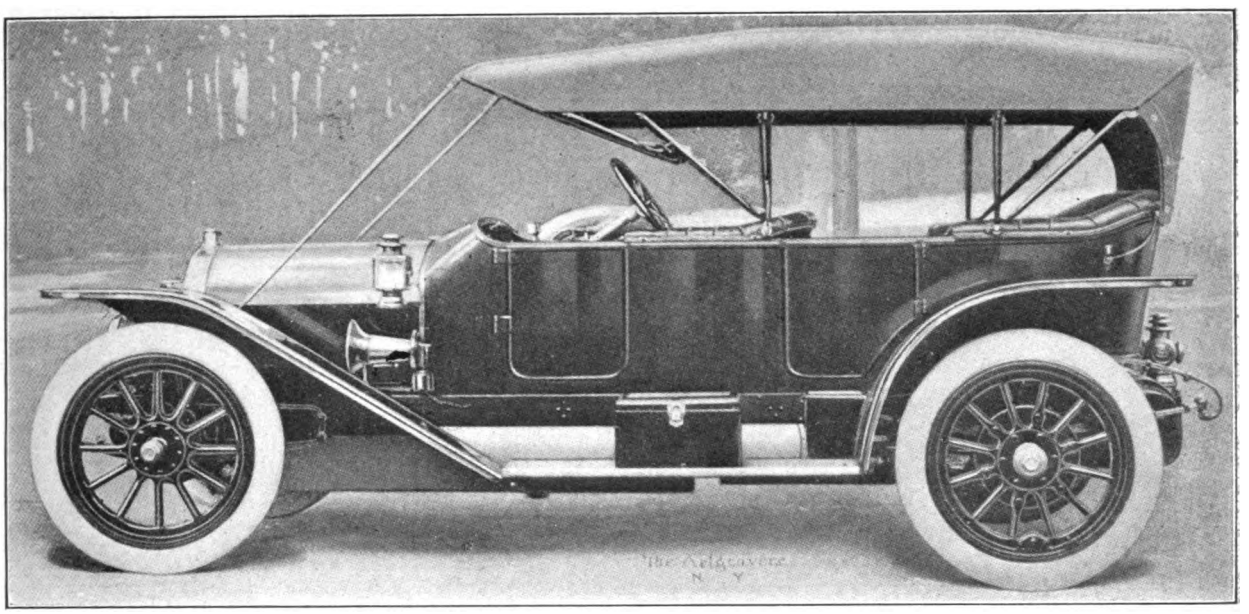
MERCER LIGHT CARS, TYPE 35.



MERCER pleasure automobiles, built by the Mercer Automobile Company, Trenton, N. J., are classed by the maker as light cars, this applying both to weight and passenger capacity. The claim is made for these machines that as they have been developed from the experience of successful racing, and from sound and advanced engineering, they are not only thoroughly mechanical, but are constructed of material that will endure under all conditions of service. The design has been simplified and each part has been created with careful regard to its service, so that each chassis is a construction that justifies the claim for quality and power.

The Mercer cars are built in the shops of the company and no parts are made by others. Every work is carried on under a system of inspection that insures the maintenance of the qualities of components and the standard of workmanship. The designs are standardized and each part is interchangeable. The machines have been tested under the continued excess service of racing and the success achieved has been conclusive demonstration that the constructions have endurance and power far greater than would be required in normal use.

The largest capacity of the cars is five passengers. The weight being relatively light the proportion of useful power applied to propulsion is correspondingly large, insuring high speed and minimizing tire wear. The elimination of complications and the extreme accessibility make for ease and certainty of maintenance and care.

All Mercer cars produced are rated as Type 35, and of these those known as series A and B are the heavier chassis equipped with either four or five-passenger touring bodies. Series C and D are the lighter chassis equipped with either raceabout or runabout bodies. In the chassis there are no material differences other than that the wheelbase of series A and B is 118 inches, and that of series C and D 108 inches, while the cylinder bore of the motors is 4.375 and 4.5 inches, respectively, and the transmission has four forward speeds and reverse for series A and B, and three forward speeds and reverse for series C and D. There is, of course, variance in the length of the chassis frame members.

Relative to the production of the cars it may be stated that the Mercer shops are equipped with all machine tools and facilities for exceedingly careful and accurate work, and every process for producing has been adopted after experiment and trial has conclusively demonstrated its value.

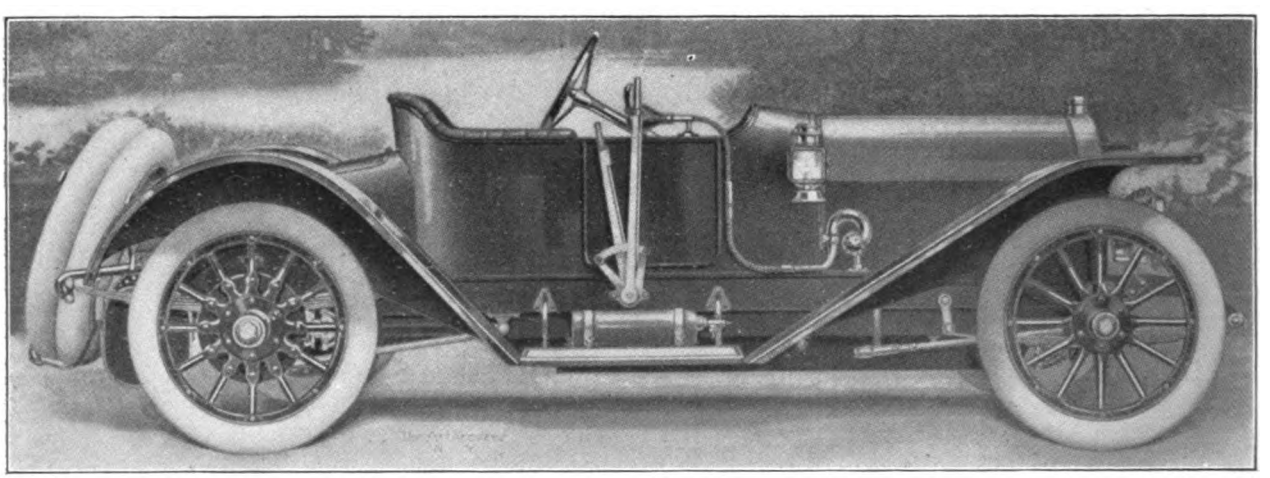
Mercer Four or Five-Passenger Touring Car, Type 35, Series A and B, Known as the Newport Model.

For the purpose of description the A and B chassis will be a sufficient subject, it being the larger. The Mercer motor is remarkably efficient. It is a T head type, four-cycle, four-cylinder engine, with bore of 4.5 inches and stroke of five inches. The rating is 32.4 horsepower by the S. A. E. formula, but before an engine is permitted to leave the testing department it must develop 58 horsepower by actual dynamometer pull at 1700 revolutions a minute, which means practically 80 per cent. in excess of the accepted standard. The smaller engine is rated at 30.6 horsepower by the same formula.

The cylinders are cast in pairs with the water jackets integral. The castings are designed to have a large opening in the outer water jacket wall above

Digitized by Google

the combustion chamber. The core work is unusually even and this insures large water chambers and uniformity of metal, with equalization of radiation and certainty of cooling. The openings in the cylinder units permit a thorough cleaning of the chambers and the circulation of the water is positive. After casting the units are carefuly annealed and after boring and reaming they are ground to a thousandth of an inch. That there may be no possibility of distortion through the heat generated while grinding the temperature is reduced by a circulation of water through the cylinders during the period the work is progressing. The intention is to produce castings that will, when finished, have equalized expansion and contraction.



The pistons are cast of the same material as the cylinders, a high grade of gray iron, having unusual length and being extremely light. These are designed with very large bosses to carry the wristpins. The pistons are turned and ground to a limit gauge and are then channeled for four rings, all carried above the wristpins. There is a liberal area between the upper and lower bearing surfaces of the pistons for the retention of lubricant and there is an oil groove below the wristpins to fully distribute the oil. Instead of the rings being turned eccentric to insure an even bearing on the walls of the cylinders they are made with uniform thickness and are peined on a special machine which insures an even strength and elasticity and equalized bearing. By this construction a lighter piston is produced, as the rings take up all the space in the pistons usually allowed for the eccentric rings.

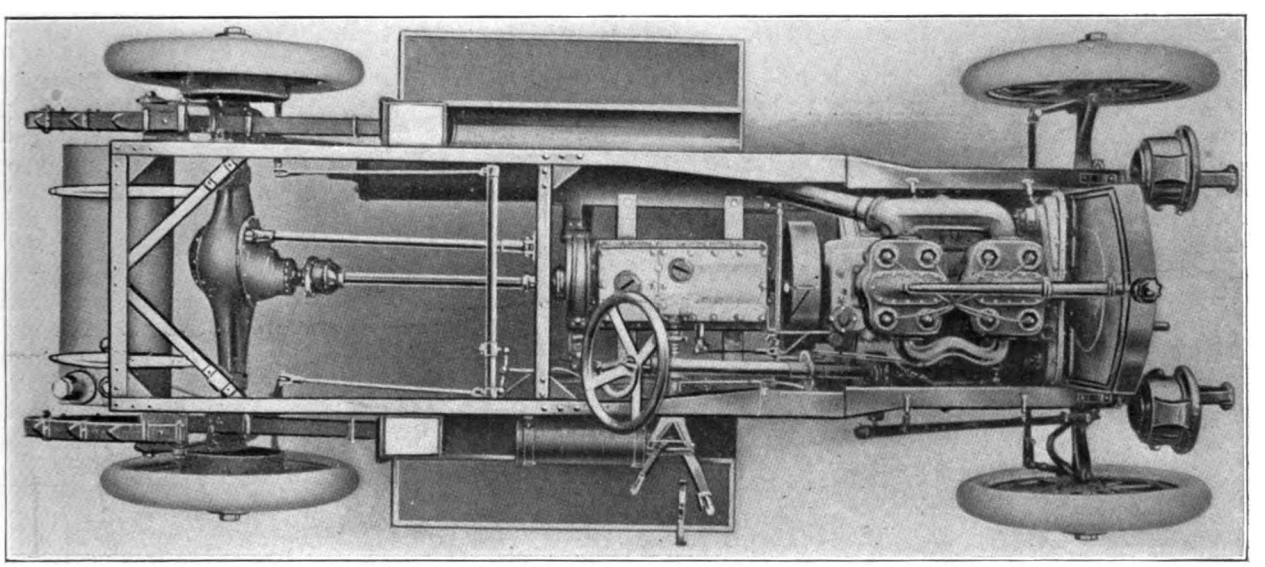
The crankcase is a barrel type in two sections, cast of aluminum alloy, the upper part carrying the main and camshaft bearings, and the lower constituting the oil reservoir. The case is divided transversely with a central web that supports the centre main and camshaft bearings. The design is such that the camshafts may be removed from the forward end of the case, the bearings being in the forward end web, and the timing gears housed by a removable aluminum cover. The cylinder units are firmly bolted to the solid top of the crankcase. At the front and rear of the case are heavy arms on which the motor is supported in the sub-frame.

The crankshaft is a heat treated nickel steel drop forging that is accurately ground to size, being two inches in diameter at the bearings. The bearings are 2.875 inches forward, 3.0625 at the centre and four inches at the rear, a total length of 9.9375 inches. The bearings are a special type and the journals of cast bronze bearing metal are lined with Parsons' white brass, the brass being knurled into the seats, this causing a high degree of endurance under crushing stresses which might destroy the ordinary die cast bearing. These bearings are used throughout the motor and have been found to eliminate the ordinary influences for deterioration and make for long endurance.

The connecting rods are drop forged steel I sections 12.5 inches between centres, and these are fitted to the crankshaft with heavy bushings, which are retained by four bolts and are fitted with shims for adjustment. The small ends of the rods are split and are clamped to the wristpins by large bolts. The wristpins are hollow, of hardened alloy steel ground to size, and these oscillate in the piston bosses. The length of the connecting rod is such that there is a minimum side thrust upon the cylinder walls and with the long piston there is practically elimination of vibration. The large bushings and wristpins, with complete lubrication, preclude adjustments even after thousands of miles of driving. It is stated by the maker with a pardonable pride that a connecting rod of a Mercer engine has never been broken, which is pointed to as an indication of excellence of design and quality of material and workmanship. It also is stated that a Mercer motor will not knock under a heavy load.

The camshafts are of low carbon steel, 1.25 inches diameter, with the cams integral, carefully heat treat-

Mercer Runabout, Type 35, Series D, with High Sides and Deep Upholstery.

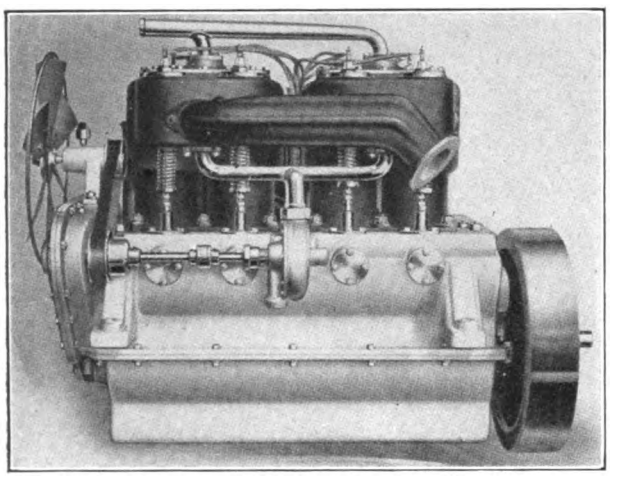


Digitized by Google

ed, with the cam faces oil tempered and ground to size. These shafts are mounted at opposite sides of the motor and are housed by the engine case. Each shaft is carried on three main bearings of the same composite type used throughout the motor and designed for great endurance. Each camshaft is driven by a manganese bronze spur with face width of 1.25 inches meshing with the gear on the crankshaft.

The valve action of the motor is not conventional in that endeavor is made to minimize all wear of the pushrods and to secure exceedingly fine adjustment of the valves for clearance. In the engine base, directly below the line of pushrod movement, are circular openings that are closed by plates. These plates carry short sleeves or bushings that are slotted vertically, the sides of the sleeves being drilled for a short shaft on which is mounted an arm. At the end the arm widens on the under side so that a flange is formed and above this the end is tapered with a circular flat face the same diameter as the pushrod. The arm is carried in the sleeve on heavy bushings. It is free to move in a vertical plane, the weight always causing it to drop to the lowest point. The plate and the arm are bolted into the case with the end of the arm resting upon the cam. As the shaft revolves the arm always contacts with the cam, this eliminating all side thrust upon the pushrods and materially reducing the noise of operation. The pushrods are operated in sleeves bolted to the engine case and the rods are fitted with case hardened adjusting nuts and screws to secure precise relations. The valves are 2.25 inches diameter with a lift of .4375 inch, and are of composite construction, with a nickel steel and low carbon steel stem welded and riveted together in a die. This insures against breakage that might result with other construction. The valve ports are large and thorough exhaustion of the burned gas and the aspiration of a complete charge of fuel is insured. The valve stems are operated in a bushing inserted into the cylinder. With this form of construction it is possible to make adjustment or replacement of every wearing part and to maintain the efficiency of the motor at all times.

The system for lubricating the motor has been tested under the excessive requirements of racing and it has been demonstrated to be in every way satisfactory and efficient. It is a combination of force feed and splash, has the merit of extreme simplicity and certainty of operation. In the base of the engine case is a reservoir into which the oil flows. In this reservoir at the right side of the motor is the gear driven rotary pump in which there is but one moving part. This pump draws filtered oil from the reservoir and forces it through a system of tubes to a sight glass on the dash and thence to three main bearings of the engine, flooding them. The overflow of oil is carried on to the crank throws of engine shaft by centrifugal force and then is gathered by small aluminum collectors and directed through the channels of the hollow crankpins to the connecting rod bearings. Beneath each crank throw is an oil pit formed by a cross web in each half of the crankcase and the oil from each drains to the level of a drain hole and flows eventually into the reservoir. The splash from these oil pits affords lubrication to the camshafts and bearings, the cams, valve lifts, pushrods and guides, the timing gears, the cylinders, pistons and wristpin bearings. The quantity of oil in the reservoir is indicated by a tube gauge carried on a cork float, a scale showing the available lubricant at a glance.



The motor is cooled by the circulation of water through the motor and a cellular radiator supported on the main frame by two ball and socket joints at the rear of the front axle. The openings at the head of the cylinder units are closed by large plates fastened by studs, these plates carrying the water out-

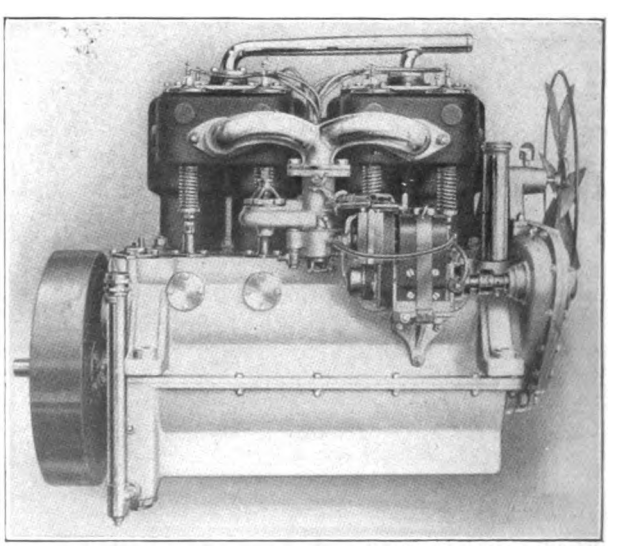
Chassis of the Mercer Type 35, Series A and B Touring Cars, Newport Models.

Digitized by Google

let manifolds. The outlets are large and there is no obstruction to the circulation. The water is drawn from the base of the radiator and is forced

Exhaust Side of Mercer Motor.

into the cylinder units at the base of the jackets, passing around the exhaust valves and thoroughly cooling them. The pump is driven by an outside shaft by the left or exhaust camshaft gear, and this same shaft carries a pulley from which a flat belt drives the large six-bladed fan, which is mounted on a bracket ahead of the forward cylinder unit. The fan shaft is carried on annular ball bearings and the belt is adjustable to insure correct tension.



The ignition is extremely efficient, it being the Bosch synchronized two point system there being two sparks made simultaneously in each cylinder on two plugs located over the inlet and exhaust valves. The energy is generated in a high-tension magneto and it is distributed by a double distributor. It is claimed for this system that it increases the engine efficiency from 10 to 25 per cent., according to the motor speed, that it lowers fuel consumption, minimizes fouling of spark plugs, and insures continuity of engine service. In addition to this system batteries are used for starting with the touring chassis.

The fuel is vaporized by a carburetor of the float feed automatic type with auxiliary air intake. The fuel is carried from the carburetor by a large manifold with direct and unobstructed inlets. The efficiency of the device used has been effectively proven in all classes of competition.

The clutch and the transmission are incorporated in a single case that is divided by a heavy cross web. The clutch shaft is mounted in heavy annular ball bearings and the clutch is an assembly of 44 steel discs that are operated in oil and engage without harshness. A stuffing box prevents the leakage of lubricant from the clutch compartment into the transmission.

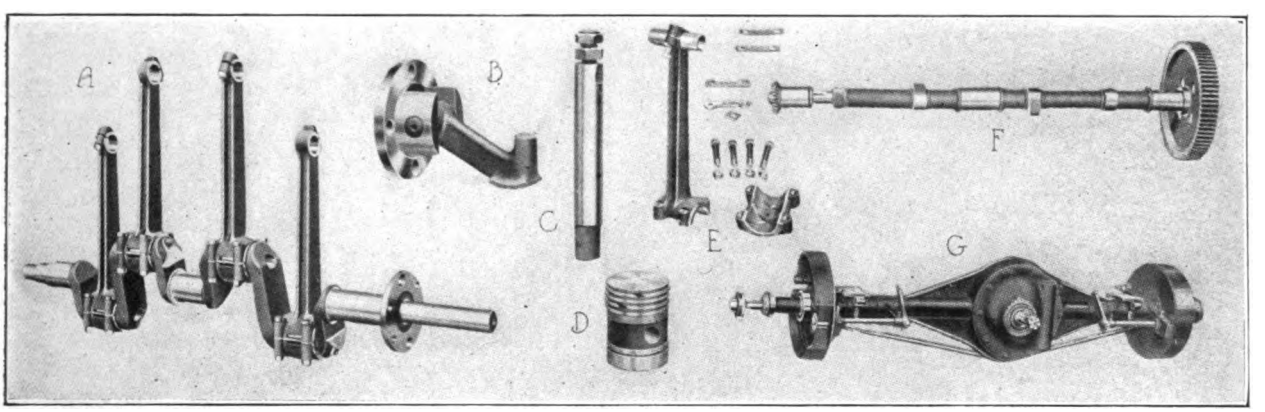
The gearset of the touring car chassis is a selective type of sliding gears with four forward speeds and reverse, the third, or direct drive, having a ratio of 3.5 to one. The fourth is higher and has a ratio of 2.70 to one and should never be used until the car has attained a speed of 35 miles an hour or more. At all speeds the gears are very quiet, and on direct drive are practically noiseless. The gear shift quadrant is a straight slot in which the lever is pivoted, instead of the conventional H slot. The gears and shafts are cut from heat treated nickel steel and are practically unbreakable. The main shaft is 1.5 inches diameter and instead of being squared it is cut with four integral splines that fit with four keyways cut in the sliding gears. This construction greatly facilitates gear shifting as there is no possibility of the gears jamming on the shaft and the large diameter of the shaft is insurance against its springing. The gears, to be positively quiet, are chucked on their pitch lines and ground out internally. The shafts are mounted in annular ball bearings. The clutch lever is mounted with two annular ball bearings and may be operated without noise. With the smaller chassis the gearset has three forward speeds and a reverse with a ratio of 2.5 to one direct driven.

The drive is by shaft with two universal joints to a full floating rear axle. The axle housing is of pressed steel and welded longitudinally to have great strength. In this the differential gears are mounted in annular ball bearings. The axle shafts are of alloy steel with four splines cut integral at each end, differing from the squared end in customary practise. They are heat treated to insure greater strength. The pinion shaft and the pinion are forged integral from alloy steel, and are carefully heat treated. The pinion shaft is mounted on two annular ball bearings. The axle relation is preserved by two radius rods and the torsion stresses are taken up by a triangular torsion bar mounted between heavy helical springs ex-

Inlet Side of Mercer Motor.

tending from a chassis cross member to the rear axle housing. Chassis frame is of pressed steel channel section, cambered forward to afford a shorter turning

Digitized by Google



radius and raised 3.5 inches at the rear to permit the low body suspension. All rivet holes are drilled to obtain the greatest strength.

The frame is suspended on three-quarters elliptic vanadium alloy springs at the rear, these being shackled at both ends. With the larger chassis the rear springs are 49 inches length and 2.25 inches width, and the forward springs are 39 inches length and 2.25 width. In the smaller chassis the springs are semi-elliptic throughout and are three inches shorter. All springs are fitted with bronze eye bushings and grease cups for lubrication. The forward axle is an I section nickel steel forging. The wheels are wood, artillery type, 34 inches diameter on the large chassis and 32 inches diameter on the smaller. The wheels are mounted on ball bearings throughout and forward steering spindles similarly fitted. The steering gear is of the semi-irreversible worm and sector type, the worm and sector being of high grade steel, carefully hardened and adjustable for wear. The worm is supported between two adjustable ball thrust bearings and the sector shafts are mounted in two hardened and ground eccentric bushings which will permit the sector to be meshed deep should it wear. All wearing parts are provided with means of lubrication.

The control is by a clutch pedal at the left and the service brake pedal at the right, with ignition and throttle levers mounted on the steering wheel, and by a gear shifting and an emergency brake hand lever at the right side of the car. The steering wheel is a one-piece aluminum casting with a hard rubber rim. The service brake is on the driving shaft directly back of the transmission case, it being of the contracting type with the cast iron shoes lined with asbestos fabric. It is operated by a right and left worm, easily adjustable for wear. The emergency brake operates with expanding shoes within drums on the hubs of the rear wheels. These shoes are faced with asbestos fabric. All chassis are fitted with foot accelerators.

The gasoline tanks are 18 gallons capacity and are of sheet metal, double riveted, with splash plates and large filling cap. They are carried at the extreme rear and are easily accessible. The fuel is forced to the carburetor by pressure from the exhaust, automatically maintained. A magnetic gauge indicates the quantity of fuel in the tank and an indicating gauge on the dash shows at all times the pressure in the tank. All the gasoline and air line piping is annealed copper tube and every joint is carefully sweated with silver solder to insure strength. All the fittings throughout are of heat treated drop forged steel and the bolts and nuts used are manufactured in the factory. With the raceabout the gasoline capacity is 25 gallons and there is a tank that will hold five gallons of extra lubricant. The tire equipment is 34 by four and 32 by four-inch tires with demountable rims. The larger chassis are guaranteed to make 65 miles an hour and the raceabout is guaranteed to make a mile in 51 seconds.

In the touring cars the bodies are noticeable for the construction of the seats which are 22 inches in width and the seat platforms are but an inch above the floor, the cushions being nine inches depth and affording a luxury in riding that is not often experienced. The backs of the seats are made with the lower sections of heavy coiled springs. The upholstery is of fine hand-buffed leather and a high grade of curled hair. There is an abundance of leg room in all models.

Components of the Mercer Chassis: A, Crankshaft and Connecting Rods; B, Lifting Arm in Valve Mechanism; C, Adjustable Valve Pushrod; D, Piston Fitted with Four Rings; E, Connecting Rod and Wristpin, with Cap, Bearing, Shims and Bolts; F, Camshaft and Timing Gear; G, Full Floating Rear Axle Assembly.

The touring bodies are exactly the same save that one is wider at the rear seat to accommodate a fifth passenger. They are fitted with fore doors and the bodies have deep cowls that well shield the occupants. The runabout is an enclosed vestibule type with deep seat and high sides. The touring models are referred to as Newports and are finished in four different colors for the four-passenger cars and two colors with the five-passenger machines, while the runabouts are each finished with three colors. This gives an unusually large range of choice for the purchaser. The equipment for the cars is unusually complete and is high class throughout.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

Caldwell's Gas Tubing will appeal to motorists who have experienced trouble with acetylene lamps due to leaky piping. The ordinary rubber tubing is short lived as the weather affects the material and it becomes hard and cracks easily, thus causing a loss of gas. Sometimes the apertures are minute and the escape of acetylene is not noticeable. This loss is augmented when the burners are clogged as the pressure is increased at the tank to obtain the desired flame. While water does not affect rubber, the oxygen in the air in time hardens the compound which loses its life or elasticity. The Caldwell tubing consists of a heavy and high grade material, which is covered with braid by a special process, this being closely woven yet not diminishing the flexible qualities of the piping. This covering protects the rubber from the air, thereby keeping it soft and considerably lengthening its life. It is pointed out by the maker that the material will endure as long as the braid is intact and that the latter is very durable. Being sturdily constructed it is not affected by the vibration of the automobile and the dark colors of the braiding harmonize with that of the machine and add to its appearance. The tubing is produced by the Caldwell Manufacturing Company, 1756 Cranston street, Providence, R. I., and is inexpensive.

★

The Sackmann Tool Stamp is the product of the Sackmann Manufacturing Company, Akron, O., and is designed to mark tools with initials or letters, thus preventing mistakes as to ownership. Standard tools, like wrenches, pliers, etc., are hard to identify and are often borrowed and others returned by mistake. Numeral stamps are handy for marking the components when overhauling the power plant, thus facilitating the reassembly of the parts. The device is inexpensive and is made to order, although certain stock stamps are carried.

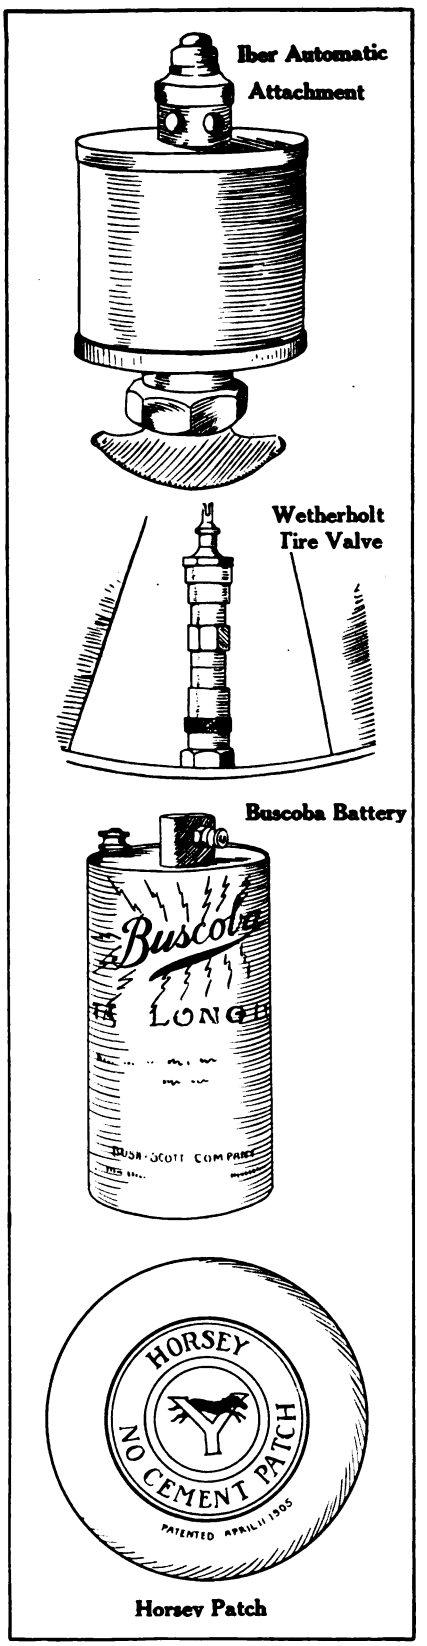
★

Tinol is a new soldering outfit produced by Hess & Son, Philadelphia, and consists of an alcohol torch, soldering copper, can of paste and a spool of solder wire. The latter is tubular and filled with a special Tinol flux and the entire outfit comes in a neat leather case. It is very compact and with it repairs may be made upon the road as it is claimed by the maker that no careful cleaning of the part is necessary, owing to the special flux employed. It is stated that electrical joints may be soldered by wrapping the part with a piece of waste wet with gasoline and burning off the fluid, after the damaged place has been coated with Tinol paste. The latter is also employed for mending piping leaks, and it is held that an amateur may repair leaky radiators successfully. The outfit is not expensive and should prove a valuable acquisition to the tool kit of the motor car as well as the private garage.

★

The Butylight headlights are self-contained; that is, they burn denatured alcohol under pressure and it is stated that a very high degree of brilliancy is obtained. This is brought about by the use of a mantle which is said to be impervious to vibration or road shocks. The fuel is utilized in a somewhat similar manner to the gasoline in a torch and the flame may be regulated as desired. It is pointed out by the maker that owing to the pressure in the container the last drop of alcohol will be converted into a useful product. The lamp is equipped with a pressure gauge and a valve, and it is claimed that it will operate efficiently at five pounds. Pressure is brought about by the use of an ordinary tire pump. The lamp is similar in appearance to acetylene members and fitted with a reflector which is cleaned easily. It is stated that a pair of lamps

Digitized by Google



may be operated at a cost of one cent an hour. Benjamin N. Levy and William T. Fox, 32 Union square, East, New York City, are agents.

★

The Iber Automatic Attachment, made by the Motor Attachment Company, Poughkeepsie, N. Y., is a device which operates in conjunction with the carburetor and it is stated by the maker that it will regulate or balance the suction of the pistons when these draw different amounts of mixture from the vaporizer. It is also claimed that a perfect vaporization is brought about, that the intake manifold is always filled with the proper mixture, and that the device automatically operates quickly at low speeds and slowly at high, thereby equalizing the suction on the carburetor. The instrument requires no adjusting whatsoever and may be fitted to any type of standard carburetor. It is held that it will save 25 per cent. of the fuel, increase power and make starting easy. It is applicable to any type of internal combustion engine.

★

The Wetherholt Tire Valve, produced by W. C. Wetherholt, Columbus, O., is designed to control automatically the pressure of tires and to prevent over inflation. The importance of proper inflation is well known and is usually determined by the use of a separate pressure gauge, the operation involving the testing of the tire after it is pumped. The Wetherholt device is so constructed that in case the tire has been pumped up over the required pressure, or expansion has taken place through friction, the valve will open and release the excess air, preventing the bursting of the shoe. Each valve is set according to the proper pressure of the size of shoe with which it is employed, and tested accurately before leaving the factory. The maker points out that it is a well known fact that in hot weather the pressure increases with friction and that air in a shoe inflated when cool will expand in service. All parts of the Wetherholt valve are interchangeable.

Horsey Patch

★

The Buscoba Dry Cell is marketed by the Bush-Scott Company, Detroit, and is made to meet the demands of those desiring a high grade special dry battery, applicable for internal combustion engines and all electrical purposes. It is of the usual form, being round, and is equipped with screw terminals. The maker claims extra long life and recuperative powers. The cell is covered with a yellow wrapper to distinguish it from other makes.

★

The Horsey No-Cement Patch, as the name implies, does not require the use of cements or acids in its application, the process involving but the usual cleaning of the tube, moistening the patch with gasoline and then affixing. The patch is manufactured of an elastic, open steam cured, red rubber and is made thick in the centre and tapering to its edges. To the cured part a layer of uncured material is permanently attached by a special process. It is claimed by the maker that a permanent repair may be effected because of its non-blooming qualities. It is produced by the Horsey Manufacturing Company, Cleveland, O.

★

The Ferguson Gas Burner attachment, manufactured by J. Ferguson, 9 West 63rd street, New York City, is a device for converting oil lamps so that acetylene may be utilized. It consists of a burner carrying member, integral with which is a spring like clip and a metal tube. The first named is slipped over the oil burner and does not interfere with its operation. The device is fitted by drilling a .25-inch hole in the side of the lamp and passing the pipe through the opening, allowing about one inch to project on the outside for the purpose of attaching the lead from the gas tank or generator. It is claimed by the maker that the burner consumes but .125 cubic foot of gas an hour

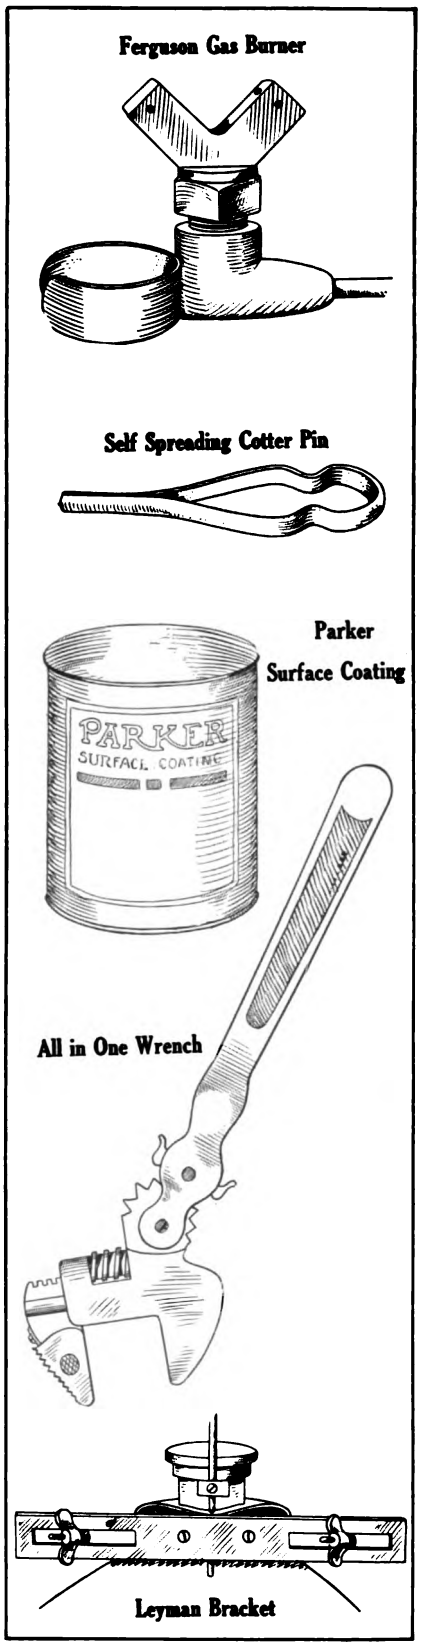
Digitized by Google

and that an ordinary tank will supply three burners for 300 hours. The attachment is fitted easily and is not expensive.

★

A Self-Spreading Cotter Pin has been brought out by Barthel, Daly & Miller, New York City, and a feature of the device is that ends open automatically, and may be driven into the bolt, nut or other place as one would a nail. This saves time, inasmuch as the ends of the pin do not have to be opened as is the case with the usual members.

★



Parker's Surface Coating is a paint held to be acid and alkali proof, being produced in several colors which the maker, the Parker Refining Company, Cleveland, O., states will not fade. The cement coating is made especially for brick, stone or concrete buildings and it is pointed out that these materials are porous and absorb and hold considerable dampness. It fills and seals these pores, keeping the cement or concrete dry, clean and sanitary. It is especially adapted for garage floors and when applied produces an elastic, tough surface, making for easy cleaning and eliminating dampness.

★

The All-in-One Wrench, marketed by the Universal Wrench Company, Indianapolis, Ind., is a combination tool about nine inches long, constructed of high grade steel and nicely finished. It is fitted with an adjustable jaw which may be employed for removing nuts, etc., and this may be reversed when the service of a pipe wrench is desired. The jaws may be adjusted to eight different angles by means of a ratchet device, which also permits the use of the tool in places inaccessible with ordinary wrenches. It is claimed by the maker that it is sturdily constructed and will withstand all ordinary stresses.

★

The Leyman Bracket, produced by the Leyman Company, Cincinnati, O., is a combination license plate and pennant holder. It is designed to fit over the radiator and is secured by a binding screw which allows of adjustment to any height. The license tag is held securely and away from the radiator, and it is claimed that the plate will not rattle or vibrate. Provision is made for the attachment of pennants, the staff being held by a set screw. The bracket is made of solid brass, highly finished; is fastened by means of wing nuts, and will fit any radiator having a filler member.

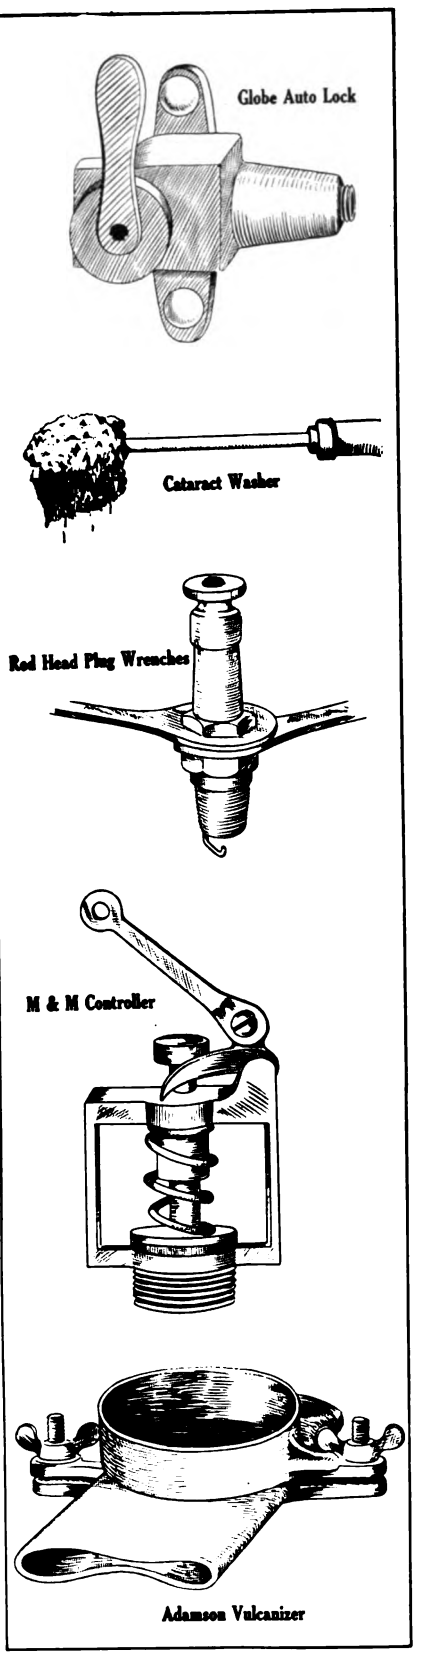
★

The Globe Auto Lock will appeal to motorists, inasmuch as use or theft of the automobile is prevented. It is a simple, compact attachment in the form of a valve and provision is made for inserting in the fuel line. It may be fitted to the outside of the car body, under the front seat or any other convenient place, and when the lever is moved it shuts off the supply of fuel positively and locks the device. The loss of gasoline by flooding or leaking of the carburetor is avoided and in the event of the vaporizer catching fire the main supply is quickly shut off. When the valve is locked, the machine can only be operated for a very short distance, this depending upon the amount of fuel in the carburetor. The device is manufactured by the Globe Auto Lock Company, Canisteo, N. Y.

★

The Cataract Washer, manufactured by the Cataract Auto-Vehicle Washer Company, Topeka, Kan., is designed for washing vehicles, and it is claimed by the maker that it will outlast five sponges. It consists of a metal handle for attaching to the water line and the other end of the tool is threaded to take the washing member. The latter is of best quality mop yarn and is wound about the corrugated brass head, being held securely. The water flows through the handle and finds its way through the perforations and then through the yarn.

Digitized by Google

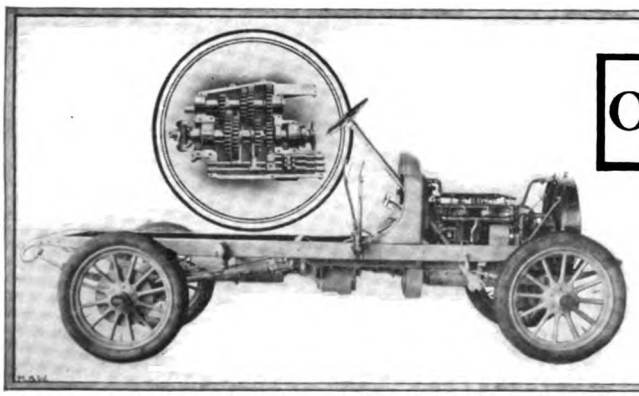


The washer is made in two styles, one having a long handle which keeps the hands out of the water and is designed for winter use. The other form permits the hand to grasp the mop for operation as with a sponge. It is stated by the maker that as the water is flowing during the washing all dirt and grit are removed easily without injuring the finish of the car. The Hagstrom Bros. Manufacturing Company, Lindsborg, Kan., is exclusive selling agent.

★

Red Head Spark Plug Wrenches are produced by the Emil Grossman Company, New York City, maker of the Red Head plugs. The wrenches come in sets of two and by their use danger of breaking the porcelain is avoided. In disassembling a plug with an ordinary wrench the insulating member is easily cracked, especially when removing or tightening the bushing. With the Red Head wrenches, one is utilized to hold the shell and another fits the bushing. These devices are furnished with a set of four plugs or may be secured for a small sum and are adaptable to standard types of spark plugs.

★



The M & M Controller and Economizer is manufactured by the Moller Bros. Controller & Economizer Company, Betz building, Philadelphia. It is designed to be inserted in the intake manifold of an internal combustion engine, the operation involving the drilling and tapping of a hole. It comprises a frame carrying a valve member which is held securely on its seat by a spring. The valve stem is fitted with a head which is in contact with a cam member pivotally mounted on the lifting lever which is actuated by a pedal convenient to the operator. When the valve is lifted the suction created by the piston of the engine draws in fresh air instead of mixture, and it is claimed by the maker that no gasoline whatsoever is drawn from the carburetor. One of the features emphasized in the device is that it may be utilized to retard the progress of the car by utilizing the compression stroke of the motor, and that as the ignition is cut off the cylinders draw in fresh charges of atmosphere thereby cooling the engine, as well as eliminating any possibility of back firing in the vaporizer. The M & M controller is equipped with a switch like device which automatically interrupts the primary circuit when the lever is lifted and by this arrangement it is claimed that rough roads may be traversed more easily, and that fuel may be saved as well. The device is compact, being about two by 3.5 inches, is inexpensive and is installed easily.

★

The Adamson Auto-Vulcanizer, made by the Adamson Manufacturing Company, East Palestine, O., is a portable repair kit weighing about three pounds with which it is claimed that a patch may be vulcanized perfectly in 15 minutes on the road or in the garage. The device is operated easily, the work consisting of clamping the tube with its repair gum in the holder and filling the latter with one ounce of gasoline. When the fuel is ignited the instrument automatically completes its work. The principle employed is that the temperature is governed automatically in relation to that of the gasoline during combustion. When the temperature of the fuel attains a certain degree, the volume of gas given off by it forces the zone of combustion above the heat conducting members. This allows the vulcanizer to cool slightly when the flame again lowers, and becomes effective. When the gasoline is first ignited the temperature of the device rises gradually to a certain vaporizing point of the fluid and remains constant. No cement or acid is utilized in the process. The kit comes complete and comprises the vulcanizer, gum, scissors, etc., is very compact and will appeal to motorists who undertake their own repairs as well as those who do considerable touring.

Digitized by Google

Overhauling the Chassis and Preparing the Car for the Road

C. P. Shattuck

HAVING completed the overhaul of the power plant, it should be left upon the motor stand if the components of the chassis are to be disassembled as in this work it is desirable to dispense with as much weight as possible. If the machine has been in service but a short time it may not require any attention other than cleaning out the old lubricant in the transmission, rear system and grease cups and replacing with new, although a general inspection of the working parts of the chassis is recommended. Any necessary adjustments should be made, and nuts and bolts that may be loose should be tightened. In the examination the steering gear and its connections with the road wheels should not be overlooked as it is important that these members be secure and free from undue play.

If the car is several years' old or has seen considerable hard service, it is advisable to dismantle the chassis and inspect carefully all of its components, as well as to note if the frame and cross members be intact, particularly if the vehicle has been in a slight accident, such as skidding against a curb, etc. While the task may appear to involve considerable labor, the owner will be amply repaid for his trouble by having the automobile in first class condition for subsequent use, when otherwise much time might be lost in making repairs during the riding season.

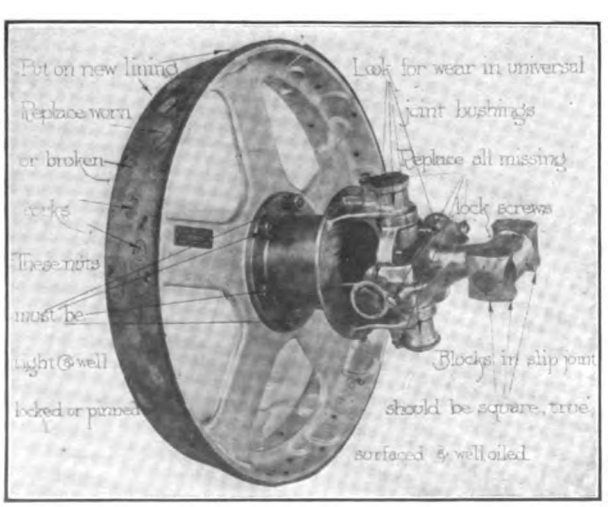


Fig. 1—Cone Clutch, with Suggestions as to Probable Repairs Needed.

If the garage be equipped with the proper tools as outlined in a recent issue of The Automobile Journal the work will be facilitated, although a successful overhaul may be accomplished with an ordinary set of tools, relying upon the machine shop for the more difficult work, such as on the transmission for example. Regarding this member as well as the rear axle, the amateur will do well to master its details of construction from the instruction book of the maker before dismantling, as with the rear axle housing in halves the differential is liable to drop out when the sections are separated, causing damage to the gears. It is a good plan for the novice to proceed slowly, studying the location of each component and its relation to the others, and noting carefully the means incorporated for adjusting and locking the parts securely. Before beginning the work a number of boxes should be procured for the small parts, and system should be the keynote throughout.

Stripping the Chassis.

All wiring, tubing and small parts should be removed from the chassis and the fuel pipes examined for chafed places. If the metal be worn slightly a few drops of solder applied properly will save purchasing a new pipe. It is a good idea to remove the fuel tank and clean this member thoroughly, as well as to inspect all connections. The filter in the line should be taken apart and all foreign elements displaced. If the tank be not fitted with a filter and water exists, it may be taken out by wrapping a piece of moist chamois on the end of a stick and inserting it in the container. The chamois will soak up the greater part, if not all of the water.

It is assumed that the front fenders have been taken off during the motor overhaul. The rear members also should be disconnected and if in need of repairs sent to a tinsmith. Their supports should be looked over carefully and if the nuts and bolts are very rusty these should be replaced with new ones. The next step is to dismantle the clutch before removing the transmission case. With cone clutches of the external type it is essential that the spring be rendered inoperative by compressing and tying it up or allowing it to expand fully. Compression may be

Digitized by Google

accomplished by the pedal or a crowbar, and wire or a stout cord utilized for tying. With the internal type, when the spring is compressed, the clutch ring or female member can be removed and the spring gradually released. Those who have never had a clutch down should treat the spring cautiously, especially if it be a strong one.

In the event of a special clutch, such as a multiple disc, flat plate or internal expanding, a study of its construction will determine how best to proceed. Although the planetary type is not as prevalent as other forms, a word as to how to disconnect it will not be amiss. If fitted to the four-cylinder motor it is secured to the flywheel by bolts and nuts. On some types of two-cylinder cars it is attached to wear is due to lack of lubrication. Fitting a new bushing, however, should be done by an expert or a machinist.

At Fig. 2 is presented a type of multiple disc clutch and transmission with its components outlined. Before attempting to remove this the cover must be taken off and the gear shifting mechanism disconnected. A little study of the construction will enable the operator to accomplish the work successfully. Before removing the transmission the old lubricant should be cleaned out and the components of the gearbox washed with gasoline or kerosene so that the parts may be inspected. This may be done before the gear shifting lever is disconnected and the changing of gears tried to note if excessive play exist.

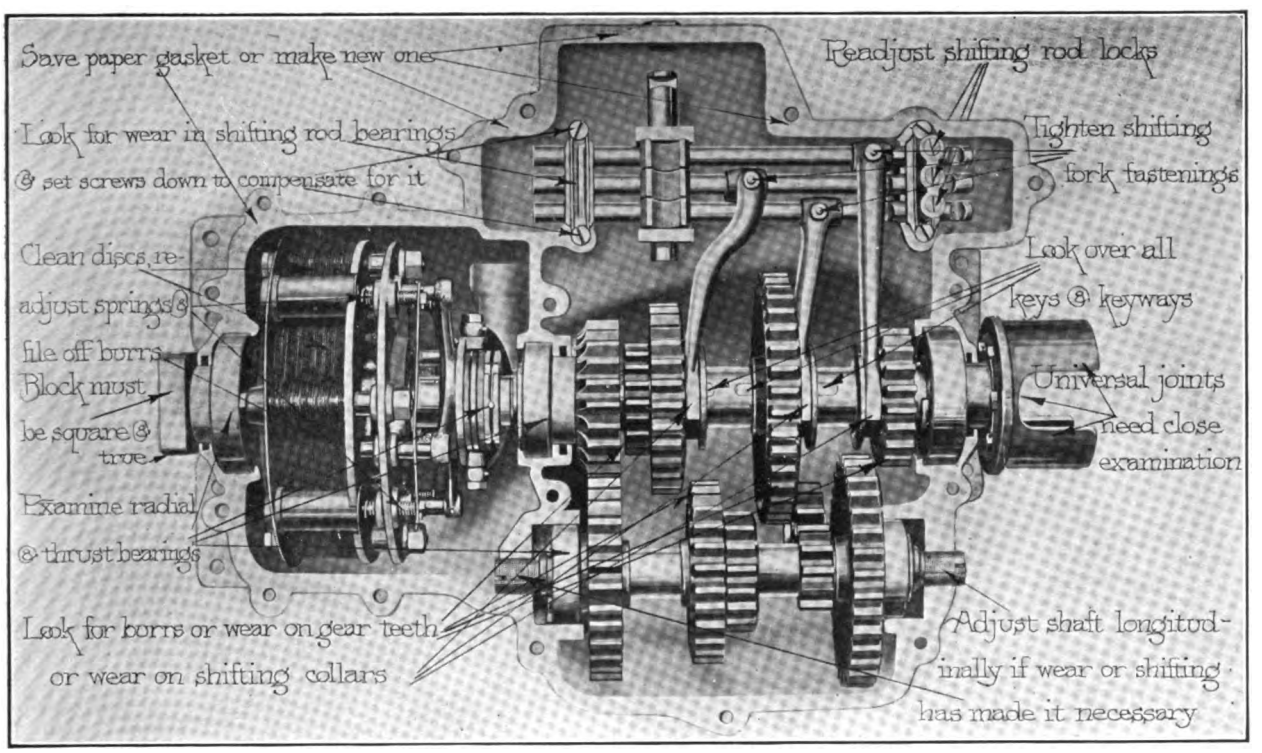

Fig. 2—Some Troubles Which May Exist in Disc Clutch Transmissions, Also Outlining Components Requiring Attention and Adjustment.

the engine shaft and will have to be removed with this member when dismantling the motor.

Clutch Troubles.

A type of cone clutch is depicted at Fig. 1 and some of the parts which wear and require attention are outlined. In fitting new leather, after cutting the material it should be soaked in water over night and in oil before applying. During the first 50 miles or so the leather should be oiled liberally. The clutch bushing should be examined for wear if difficulty has been experienced in changing gears. When this bushing is so worn as to allow the clutch to hang down on the spindle, the clutch will drag causing it to revolve. This bushing is overlooked as a rule because of its inaccessibility, and the excessive

The discs should be examined, and any burrs removed. The shifting rod bearings, keys and keyways and universal joints require attention and if these be worn badly the gearbox should be taken to the machine shop for repairs. While instructions could be given for this the amateur had best not undertake machine work of this nature.

The illustration outlines parts which may be worn or require adjustment and with the aid of the instruction book the owner should be able to readjust the components. Fig. 3 presents a clutch and gears removed from the box, and outlines excessive wear. It will be noted that the teeth of the gears are considerably worn and that burrs exist. The shifting collar is in bad condition as is the lever, the holes of the

Digitized by Google

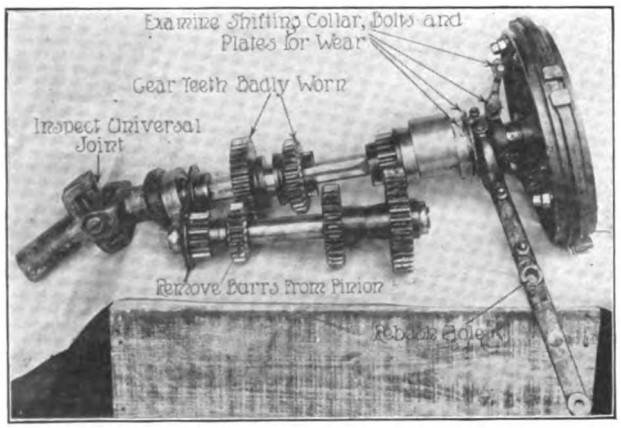

Fig. 3—Gears and Gear Shafts Removed from an Old Car to Show Excessive Wear.

latter being oblong. New parts should be secured or the collar repaired by adding plates and the holes fitted with a new bushing. The burrs may be removed by filing. If the universal joint be worn badly a new one should be fitted, but in case the part cannot be secured from the maker the old member will have to be taken to a machine shop, or a new joint must be made.

Removing the Gearbox.

In taking out the gearbox care should be exercised. This member is heavy, especially when a unit with the motor. Usually it is an easy matter to remove this, but if large and heavy, it will require at least two to lift it. Ordinarily it is secured by four bolts on the feet and when these have been taken out, as well as the universal joint and operating rod connections, little trouble will be experienced. If the lugs to the cross members are in the upper half of the housing, a little ingenuity will be required. A plan which may be tried with success comprises inflating the tires hard, placing a packing beneath the gearbox, then letting the air out of the shoes until the box has settled down on the support. The bolts may then be removed, and the top half of the case and the shafts taken out easily. The reverse process may be employed when assembling.

The operating mechanism of the levers may be worn and Fig. 4 illustrates components subject to wear and looseness. New pins may be required if much lost motion exists, and these should be of high grade material and hardened. New bushings also may be necessary. The nuts and bolts securing the quadrant should be examined for looseness and set up snugly.

Steering System Important.

Too much stress cannot be laid upon the necessity of examining carefully the components of the steering system. It is easily disassembled and should be when considerable lost motion is present, particularly with an old car. The work may involve taking it completely apart which may require the removal of the dash to disconnect the upper end of the post. The amount of wear or play may be ascertained by rotating the wheel and noting the lost motion. If the system is to be disassembled the reach rod and steering lever should be disconnected.

At Fig. 7 is depicted a conventional type of steering system with its components outlined, as well as suggestions for locating wear, etc. The gear carrying member may be removed by taking out the bolts holding it to frame or sub-frame. The screws of the wheel should be tested for tightness, keys and keyways looked over carefully, and thrust bearings adjusted. The reach rod, or the member connecting the steering lever with the spindle, is provided with ball and socket joints. These are secured by a nut and cotter pin and after taking these parts out the old lubricant should be removed and new inserted. The adjustment should be made so that the part moves freely yet without play. New cotter pins should be fitted in assembling and the ends turned over. If the leather coverings are worn new ones should be made or purchased.

How to Jack Up Wheels.

Before overhauling the steering system it is an excellent plan to jack up the front wheels. Wooden supports may be made and in raising the axle the lifting device should not be placed under the spring or spring clips. The brakes should be set, or rear wheels blocked so that the chassis will not roll and cause the axle to slide off the supports. Care should be exercised in placing the supports so that there is no possibility of their slipping. Having made sure of this feature a strip of wood should be inserted between the spindle and axle and the wheels tested for play. If any exist it should be removed.

The bearings are usually of the adjustable type, and with ball bearings it is an easy matter to reduce

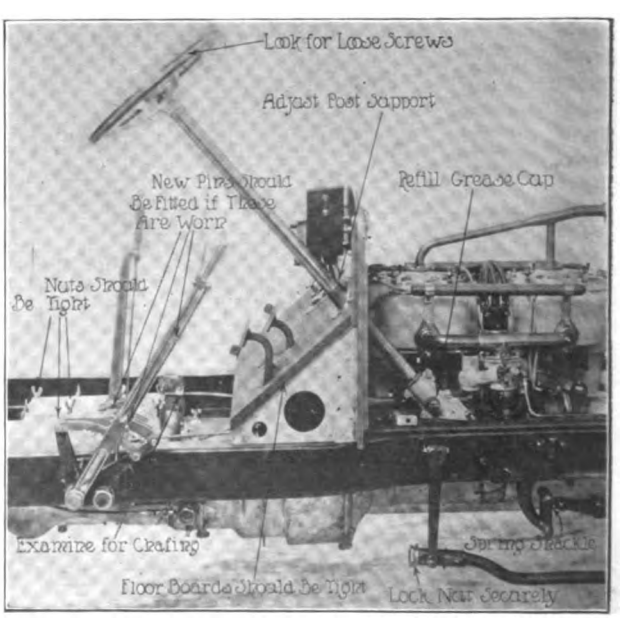

Fig 4—Outlining the Gear Shifting Lever and Quadrant, Steering Post and Wheel and Parts Requiring Attention.

Digitized by Google

lost motion. It is a good plan to remove the wheel, take out the bearing retainer and clean out all old lubricant. The balls should be examined very carefully and if excoriations exist new ones procured—a full set, as it is not a good plan to use new balls with old ones. Worn races and cones should be replaced with new.

Removing Races.

Sometimes it is a difficult matter to drive out the the races and remove the cones from the spindle arm. The cone may be started by inserting a cold chisel between it and the spindle and tapping with a hammer.

If unable to drive the races out with a rod or cold chisel, it may be necessary to apply heat to draw the temper and then break them up. Usually, however, they will yield to driving methods. Should the race be crushed; that is, if the balls have worn through it and indented its seat, the heat method may have to be utilized or the hub removed. Some makers drill holes in the hub member so that the work is made easy. The hubs are taken out readily by removing the nuts and bolts. The latter should be set up securely in reassembling.

If the bearings require adjustment only, they should first be packed with grease. The adjusting member is then turned until the bearings appear to stick or lock, when the nut is slacked off about half a turn and secured. The wheel should next be revolved and it should rotate easily. The locking nut should be set up snugly and a new cotter pin fitted. In driving in new races a block of wood should be utilized and care taken not to break the part, as they are hardened and break very easily. Do not attempt to drive with a hammer unless it is of lead or copper. The race should be driven evenly and should fit snugly. If the felts are worn they should be replaced with new ones.

Tierod, Spindles, Etc.

The greater part of lost motion in the steering system may be in the spindles and tierod connections. If the operator has neglected to lubricate these members or they have been exposed to the dust without boots or covers, they are likely to be considerably worn. Having adjusted the bearings of the front wheels it is an easy matter to test for worn spindles and pins and this may be accomplished by holding the wheel securely and rocking it, noting at the same time the amount of play. If the bearings be plain members, the cotter pin and retaining nut on the bottom of the spindle pin is removed, the pin screwed out and examined. The spindle is usually fitted with bushings which may be driven out and new members fitted. If the pin be worn badly, however, new bushings will only partially take up the play and it is advisable to secure new pins and bushings as well. Before replacing the new parts the oil grooves and holes should be tested to note if any obstruction exist as dirt or sawdust may have found its way in when being packed at the factory for shipment. The pins should be well oiled before fitting, the retaining nut set up snugly and a new cotter pin used.

Coming to the tierod, it may be discovered that much of the play is due to this member. With the

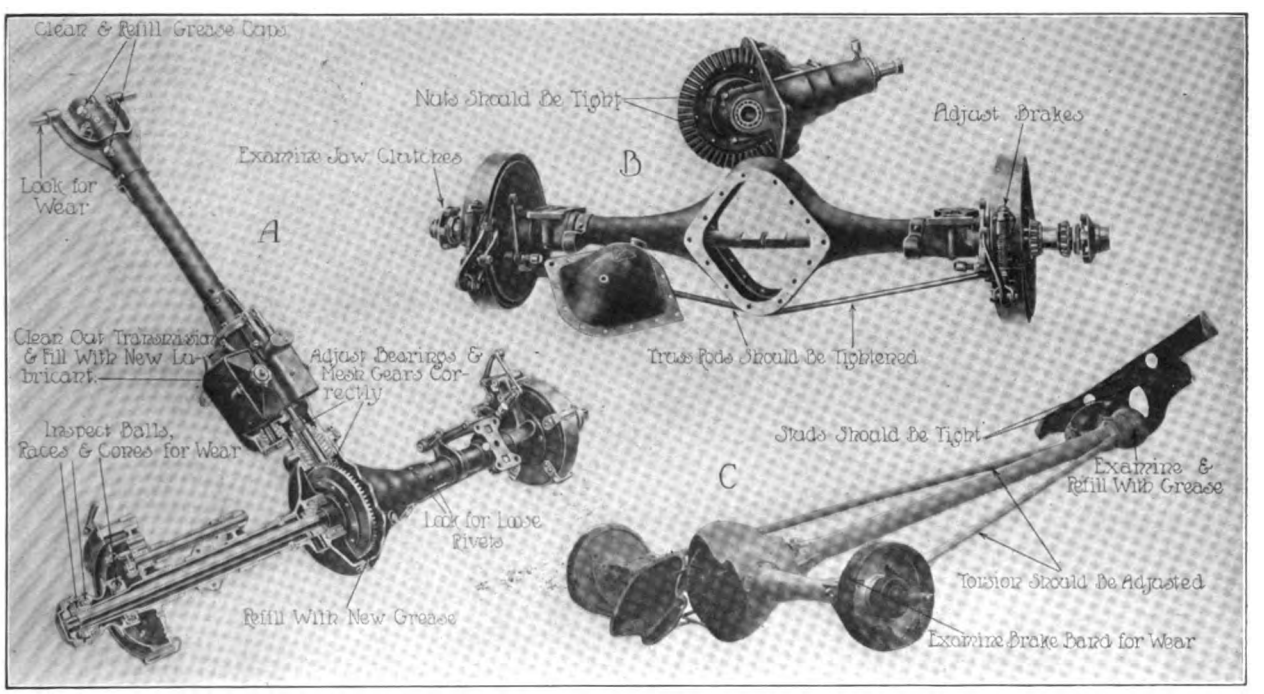

Fig. 5—The Overhaul of the Rear Axle Is an Important Detail: A, Illustrating Design of Transmission and Axle as a Unit; B, Full Floating Type Which Is Disassembled Easily; C, Another Form Having a Ball and Socket Member Carrying Universal Joint.

Digitized by Google

wheels held securely the rod may be moved to and fro and the amount of lost motion noted. If the bushings and pins are worn new ones should be secured, or the spindles and the rod taken to the machine shop for repairs. The grease cups should be cleaned out thoroughly and new lubricant inserted in the reassembly of the parts.

Cleaning the Springs.

If the springs are to be removed for cleaning or repairs or new shackle bolts fitted, the front of the car will have to be supported. This may be accomplished by placing a piece of joist under the frame and jacking it up. The spring clips are then removed and examined and if cracked or the threads stripped new ones secured. Unless of special design they

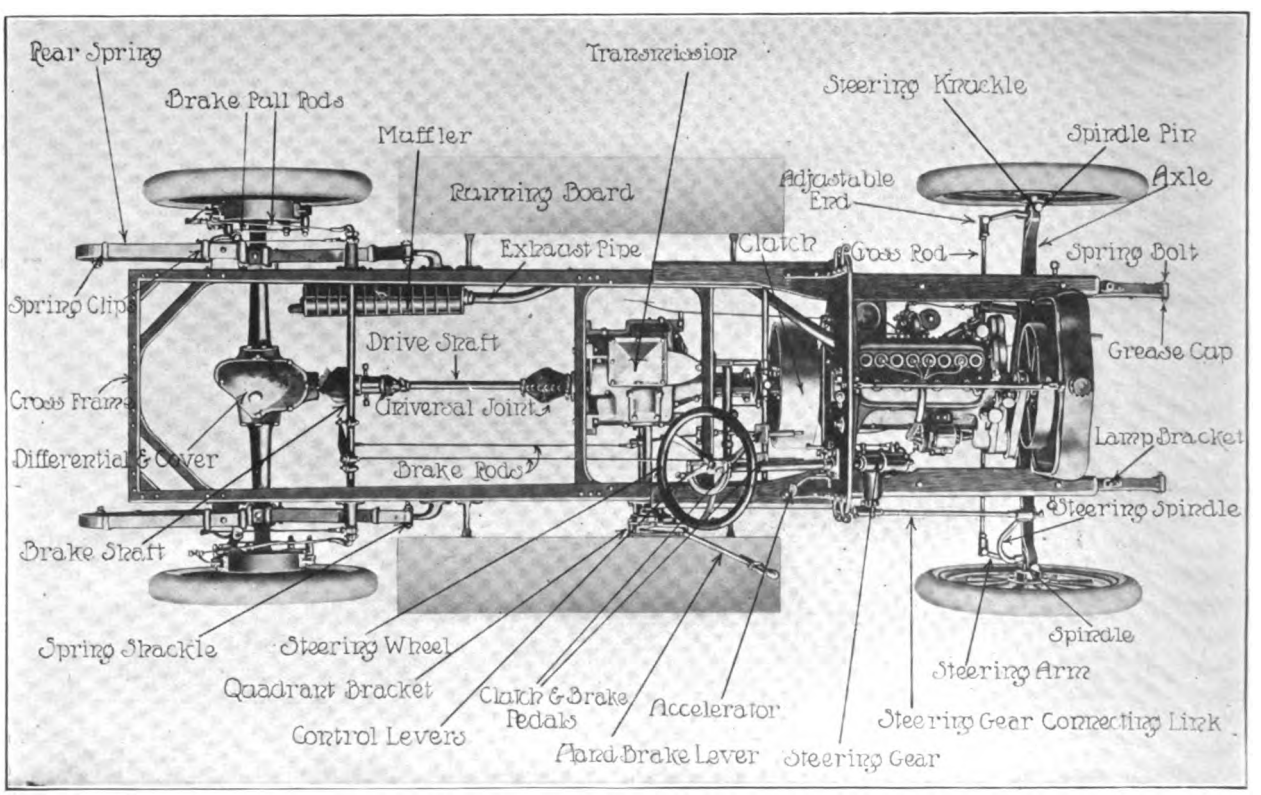

Fig. 6—Depicting the Components of a Chassis and Their Location to Facilitate the Work of Overhauling.

may be obtained at any carriage supply house. It is an excellent idea to take the old member when making the purchase to insure obtaining the correct size.

The spring pads should be looked over and it may be possible that one is broken. This will necessitate sending the axle to a welding concern. If the leather or canvas pads are damaged new ones should be made. In disassembling a spring it should be placed in a vise and the jaws of the latter compressed firmly. The retaining spring bolt is then removed and the vise opened slowly. In taking the leaves apart they should be marked so that they will not become mixed as each is bent to a special shape. The leaves should be marked with a prick punch, one dot on the outside edge of each leaf of the right hand spring, and two dots on the outside edge of the left spring. The springs should be cleaned thoroughly and lubricated with a paste of graphite and oil and plenty of the former should be used. In reassembling the leaves the vise is utilized as before. In replacing the springs upon the axle the spring clip nuts must be good and tight. The grease cups and grooves should be cleaned out and new lubricant inserted.

It will be found that springs that have been properly treated with lubricant will afford easier riding qualities than before. In overhauling the springs it may be found that the spring eyes are considerably worn and the bolts as well. New steel bushings may be made and forced in and in fitting new bolts provision should be made for the passage of lubricant. There is considerable wear to these members if they are not constructed of the proper material, and if grease cups are not provided it is an easy matter to drill and tap for the fitting of these members, taking care to make provision for the passage of the grease to the bearing parts.

Overhauling Rear System.

The labor involved in overhauling the rear system will depend upon its design and condition. It is difficult to disassemble some types, especially old styles of cars which are fitted with ball bearings of the same design as those employed in the front axle. The writer recalls particularly a car built in the early

Digitized by Google

part of the '90's on which the use of the blow torch, drill and cold chisel were necessary to remove the races. The modern rear axles, however, present lit-

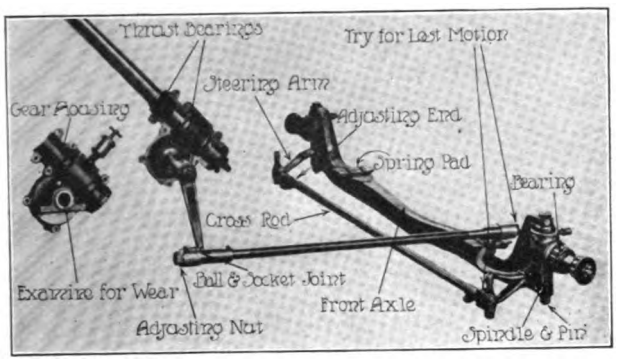

Fig. 7—Showing the Steering System and Components of the Front Axle Which Are Subject to Wear.

tle difficulty in taking apart and assembling if the amateur will study their construction before attempting the work.

Several conventional types are depicted at Fig. 5 and that at B is easily taken apart and adjusted, it being of the full floating design. The rear axle may have the transmission with it as outlined at A, or the construction may be as shown at C. That at A permits of the removal of the differential and driven axles without jacking up the wheels which will be necessary with the other types.

Care should be exercised in handling the components of the rear axle and they should be marked if in doubt as to their assembly. Assuming that an axle similar in design to that at B is to be overhauled, the frame should be jacked up until the wheels are almost clear of the floor; that is, if the springs are to be removed and treated as were the front members. The driving shaft is next disconnected and spring clips removed. Having made sure that the connections are all clear, the axle is rolled out, taking care that the exposed end of the differential member does not drop to the floor in the process. The old lubricant should be drained out of the differential housing and the cover removed. Before taking out the differential the driven axles should be slipped out, and this is accomplished easily.

Before disassembling the differential it should be washed with gasoline so that the adjustments of the crown and pinion gear may be noted and if not marked they should be, to insure correct meshing in the assembly. The ball bearings should be examined carefully for wear and if the crown or pinion gear is burred the rough places should be removed with a file. If the gear be hard, as it probably will be, emery or carborundum may be used with an old file. If the gears are worn new members should be fitted as the use of a new pinion with an old crown member is not recommended. After disassembling the rear axle an examination may be made of its components and a decision arrived at as to what parts, if any, will be necessary. If the amateur is in doubt some mechanical friend with a shop training can generally be found who will help with his advice, which will also have the merit of being disinterested.

Other Types of Axles.

Some machines have the transmission and rear axle as a unit as shown at A and the axle casing or housing in halves. The latter should be taken apart carefully, as the differential and crown gears may fall out suddenly with a gush of grease and oil. It is a good plan to steady the axle upright on one of its ends, and after the bolts holding the two halves together have been removed, the upper half can be lifted off, leaving the differential and crown gears lying in the lower half. A sharp lookout should be kept for ball races, thrust washers, or loose balls that may tumble out of the upper half as it is lifted away and which may be lost in the mass of grease and oil.

Axles similar to the design shown at C and connected with the transmission by a ball and socket arrangement are released by removing the nuts from the studs securing the retaining plate and by rolling the rear system out from beneath the chassis. In the examination of the components of the rear system the torsion rods should not be overlooked and any misalignment or extreme play should be remedied. Particular attention should be paid to the truss rods and these members should be snug but not too tight. They are usually equipped with turnbuckles which makes adjusting an easy matter.

Meshing the Gears.

After the necessary work on the axle has been completed it may be set up and new cotter pins used throughout, as well as new wire where the retaining nuts and bolts of the differential are thus retained. Some cars are so constructed that the meshing of the gears may be done with the axle assembled while

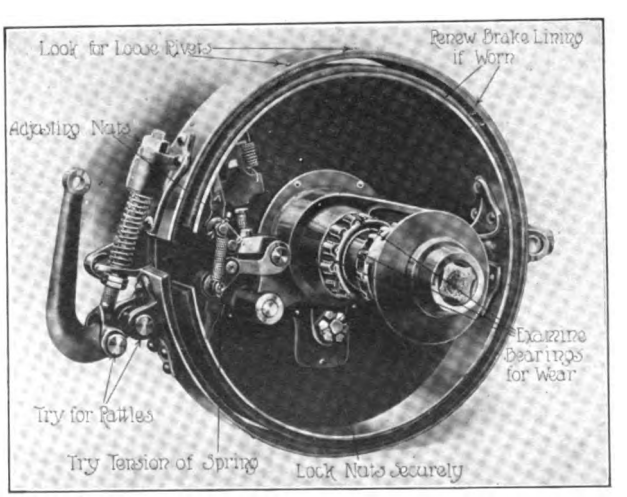

Fig. 8—A Conventional Type of Brakes, Illustrating Adjusting Members and Their Assembly.

others have to be set by "feel," or as one might say, by guess. The depth of the meshing on the teeth of the crown and pinion gear cannot be altered in any

Digitized by Google

scientific way by either longitudinal or lateral adjustment alone. Considered theoretically the adjustment should be by a combination of the two so ar-

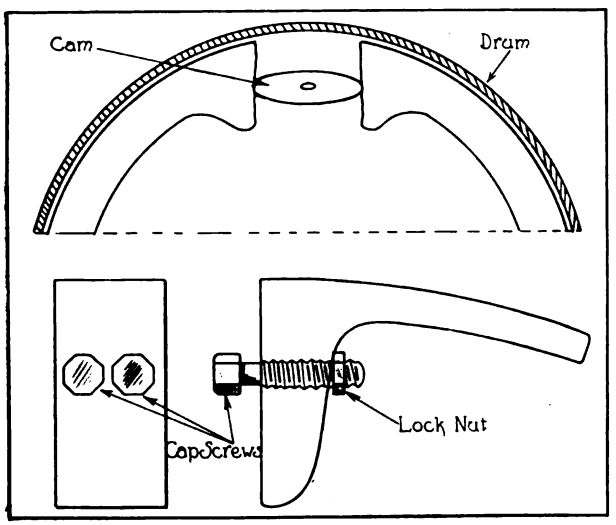

Fig. 9—Method of Repairing Expanding Brakes When Cams Are Badly Worn.

ranged that its direction is at right angles to the cone radius. Practically speaking, however, not much more can be done by the amateur than to adjust, then slacken a little beyond the point where the pinion turned by the hand with the wheels jacked up runs freely, with no binding or sticking. A certain amount of backlash will be perceptible in even a new axle. If the bevels hum unduly upon the road a slight modification of the adjustment should be tried, and if they were reasonably quiet before the overhaul they should be set up again as they were.

If the car be of the chain driven type the sprockets and chains should be cleaned and examined for wear and both replaced with new members if necessary. A new chain will not give satisfaction on an old sprocket or vice versa. Chains should be washed in gasoline and kerosene and boiled in a combination of mutton or beef tallow and graphite. This will penetrate the bearings and tend to keep out foreign elements.

Care of Brakes.

The brake linings should be looked over during the overhaul of the rear axle and if they be worn, replaced with new material. In riveting the new lining the holes should be countersunk so that the heads of the holding members will be well below the surface of the material. Some adjustments and repairs to brakes are suggested at Fig. 8. There are cars, however, which are fitted with the expanding type and the cams and blocks are so badly worn that further adjustment is impossible. At Fig. 9 is presented a plan of utilizing cap screws when the cam member is worn. The drum member is drilled and tapped and the screws fitted and held by a lock nut as depicted. If metal-to-metal drums are employed and worn they should be replaced with new ones. The springs actuating the parts should be tested and if they have lost their elasticity new ones should be fitted. Brakes are important, especially on a car with the sliding gear transmission and the amateur cannot be too careful in the overhaul of these members.

In the overhaul the muffler and exhaust pipe are frequently overlooked by the amateur who is apt to consider these components self-cleaning because of the pressure of the expanding gases. The novice will be surprised to note the amount of soot or carbon which collects here, obstructing the flow of the gases, also decreasing the power of the motor. The proper method is to disassemble the muffler to displace the accumulations, but the silencer may be cleaned by tapping it with a wooden mallet and emptying its contents. The pipe leading from the exhaust manifold to the muffler ought to be treated in a similar manner.

The frame and its cross members should be examined for cracks or breaks, and these welded. Parts held by rivets should be inspected, for these have been known to shear off or loosen. During the work of overhaul the tires and inner tubes should be looked over and sent to the tire man for needed repairs. The rims should be cleaned and while some advocate painting these members the writer utilizes a mixture of graphite and oil and polishes the rims thoroughly. This is water proof and prevents a shoe from freezing to the rim.

Lining Up the Wheels.

As adjustments have been made to the tierod, the wheels should be tested for alignment; in fact, it is an excellent plan even if parts have not been disturbed. A method is outlined at Fig. 10 and consists of stretching two pieces of string or cord across four chairs or boxes as indicated. The string is laid so that it is about .125 inch away from the tires and

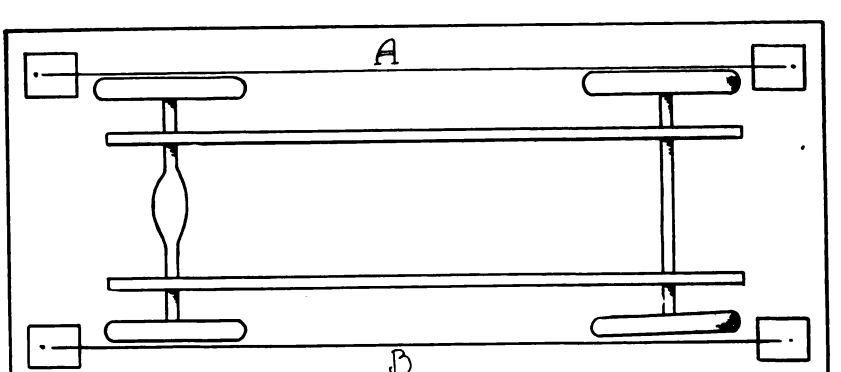

Fig 10—Illustrating How Alignment of Wheels May Be Tested with String Stretched on Chairs or Boxes.

it should be on a level with the floor at the height of the axles or above them. The two strings should be parallel, the same distance apart at one end of the car

Digitized by Google

as the other; that is, if the front and rear axle are the same width. They also should be parallel with the side members of the frame of the machine.

The distance between the twine and the felloes of the wheels is measured on both side of the car. If a difference exists the wheels are out of true or misalignment is present. If the wheels be true the string will be as depicted at A. In assembling the tie-rod misalignment may be present as shown at B. Here the right front wheel is toed in and this should be corrected. The front wheels should toe in a trifle, about .125 inch for both; that is, the distance between the front of the wheels should be .125 inch less than that of the rear. Misalignment of the rear wheels may be detected by the string method and if any exist should be corrected. A little study of the diagram will enable the amateur to check up the alignment.

Testing Out the Car.

Before replacing the body the car should be taken out on the road and tested. It is an easy matter to make a testing seat by utilizing a couple of iron supports, bolting these to the frame and fastening a a board to them. A chair minus the legs may be bolted to the board, although this is optional. If the fuel tank is fastened or secured in the body, an emergency tank be made by soldering a metal tube to the side of a can and connecting it with the carburetor by a metal tube or rubber pipe. The screw cap of the can should be perforated to provide a vent.

Before starting out care should be taken to try the brakes and note if there is plenty of lubricant in the crankcase and oiler. The latter should be adjusted to feed more oil than ordinarily. During the first few miles of the testing trip the car should be driven slowly and carefully, and any strange noise should be investigated before trying its speed and hill climbing abilities. If no trouble develops the car should be returned to the garage and all nuts gone over. It will be found that some may be taken up a trifle. Minor adjustments probably will be required and these may be made more easily than if the body were returned before testing.

In replacing the body the bolts and nuts should be examined and if the threads are poor new ones should be fitted. In connecting up the fuel line each connection should be inspected for possible leaks and it is a good plan to drain off a little gasoline at the carburetor to remove any foreign elements which may be present in the piping. Lack of space prevents the writer from going into details regarding minor adjustments but these should be accomplished by anyone who has had experience in operating a motor car. Regarding the replacement of the accessories, this may be done without any suggestions other than that the speedometer cable and connections should be looked over for wear and lost motion, and the grease cups or lubricators utilized in connection with this device emptied and refilled. Overhauling the motor car not only increases the knowledge of each component but is a great saving in repair bills, to say nothing of the confidence developed in driving.

ENGINEERS TO MEET IN DETROIT.

The Society of Automobile Engineers has decided to hold its regular midsummer meeting in Detroit, June 27-29. This is in keeping with the policy of the organization to divide its meetings between the East and West.

RESPONSIBLE FOR COLE SUCCESS.

The remarkable success of the Cole Motor Car Company, Indianapolis, Ind., makes it interesting to consider for a moment the personality of the man behind the institution. President J. J. Cole, whose photograph is presented herewith, has been identified with the manufacture of Cole cars since the inception of the company. Heretofore, he has delegated the selling end of the business to others, devoting his entire time and attention to the production of cars, and as a result the various Cole models have represented the best that J. J. Cole was able to put into them.

J. J. Cole, President Cole Motor Car Company.

He is a modest man, little given to discussing the part he has played in the development of a successful business. The secret of his plan appears to have been the concentration of effort. During the period necessary for building up a business of this magnitude, it was his idea that a separation of the manufacturing and selling ends would result in permitting each employee to give better attention and more time to his individual duties. The wisdom of this suggestion is found in the splendid foundation of the Cole selling organization, backed by a coterie of Cole distributors and agents, which is hard to equal.

Under the new arrangement, which will go into effect July 1, the Cole Motor Car Company is to take over the sales branch, heretofore conducted under the name of the Henderson Motor Sales Company, but it will retain its individuality as before. President Cole will continue to devote his time and attention to manufacture, while the sales end will be in charge of Charles P. Henderson, as sales manager.

THE AUTOMOBILE JOURNAL

VOL. XXXIII. APRIL 25, 1912. NO. 6.

Published the 10th and the 25th of Each Month.

William H. Black, Treasurer. D. O. Black, Jr., Secretary.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 W. 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurian, 4507 Clifton Avenue.
BOSTON—John W. Queen, 6 Beacon Street.

Subscriptions:
The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Ten cents the copy.

Advertising Rates:
Information given at request. All advertising copy to insure publication must reach this office 10 days preceding the date of issue.
Remittances should be made by Check, Draft, Postoffice, Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.
Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

TESTING REGISTRATION LAW.

It is not surprising that the motorists of Mississippi have decided to test the constitutionality of the recently enacted registration statute. That commonwealth has had no such law until the present, but the automobile owners have had abundant opportunity to see how the plan works in other sections of the country. It is understood that they do not object to the tax if it is so labelled, but they do object to a registration fee for highway improvement, unless the same action is taken with respect to horses, mules and ox teams.

This appears to be a point which has not been determined legally, simply because the motorists of other states have been content to submit to such laws through their interest in good roads. The time is rapidly approaching, however, when it will be necessary for somebody to take the initiative in carrying the point to a court qualified to settle the matter definitely.

There can be little doubt that horse drawn vehicles, and the entire public, reap the benefits from good roads. With the general use of motor trucks in commercial haulage, this position will become more and more apparent. If other states shall follow the example of Massachusetts, for instance, in attempting to restrict the use of mechanical transports, it will become absolutely necessary to have the courts define the status of such vehicles. Motorists everywhere will watch the outcome of the Mississippi case with interest.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

PUBLIC AUTOMOBILE SCHOOLS.

The suggestion of Mayor Fitzgerald of Boston, relative to the establishment of classes for instruction in automobile driving in the public schools, is worthy of serious consideration. The trend of the times is toward the teaching of subjects which will be of practical value to the child in after life, and it would seem that a thorough knowledge of the motor car and its components is of decided importance when viewed from this standpoint.

There can be no disputing the fact that the automobile is the modern method of transportation. This holds true particularly of the business world. Of course, it will be argued that the young men have an excellent opportunity before them for securing profitable employment as private chauffeurs, but they are quite as likely to realize upon their investment as operators of mechanical transports.

In addition, it has been demonstrated that the more an automobile owner knows about his machine, the less liable he is to disregard the rights of others, partly because he realizes that careless driving tends to increase the cost of motoring. It follows that if the next generation begins active life with a thorough working knowledge of the motor car, the dangerous operator will be eliminated, correspondingly.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

MONEY FOR GOOD ROADS.

The people in at least two states, New York and Maine, will have opportunity at the next general election to express their desires with respect to the use of large sums for the construction and maintenance of improved highways. This is a somewhat new departure and the outcome will be watched with interest.

The plan calls for issuing bonds, and appears to be based on the proper principle that the welfare of the whole people demands better means of trans-

Digitized by Google

port. Heretofore, motorists have been expected to meet the entire expense of good road construction and maintenance, the amount of work to be done depending upon the fund which could be accumulated by increasing the registration fees on automobiles.

Maine has discovered that it pays to induce tourists to visit that commonwealth, just as some of the countries of Continental Europe have learned this same fact. Evidently, there has come with this new knowledge a realization of the injustice of compelling one class of its residents to pay the entire cost of securing this added business prosperity. The whole electorate is to determine whether or not Maine shall continue to foster this tourist trade.

Much the same condition prevails in New York State although not in such a marked degree. And it may be added that this rule might apply in other commonwealths as well. Motorists should watch the outcome of this new plan in these two states, and unless the results are very different from what is expected, they should see that their own legislatures are urged to adopt the same provisions another year.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

SAFEGUARDING AEROPLANES.

The discovery of Louis Bleriot with reference to the need for greater strength in the upper guy wires of monoplanes is one of the most important yet made in the study of aerial navigation. It hardly is to be doubted that the same conditions apply, at least in a measure, to the biplane, and it is probable that safeguarding aeroplanes in the manner suggested will be a long step forward in the field of aviation.

Much as it is to be regretted, it seems that progress in any line of endeavor is destined to be at the expense of human life. Those who confine their comment upon this subject to the number of accidents which have resulted in this newest science, lose sight of the fact that there remain certain unsolved problems in other fields. It is only necessary to recall events of the past two weeks to demonstrate this position.

It can be regarded as established that the aeroplane has an important part to play in the future development of the world. The Wright brothers and other pioneers have contended from the first that it can be made as safe as any other form of conveyance. It only remains to find the weaknesses and remedy them as they shall be made apparent. Wonderful progress has been made within the past year and a half. The latest discovery is along the same lines as others which have been overcome in a manner similar to that suggested in this instance.

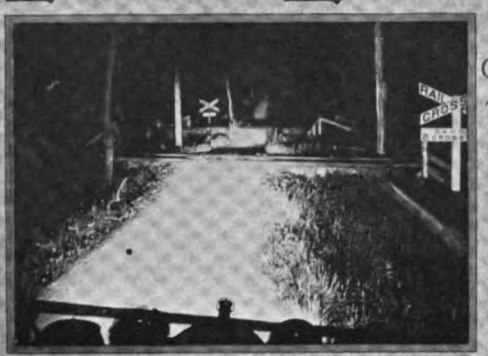
Experimentation must be made along the lines of practical endeavor. There is a hopeful sign in the absence of altitude records and other so-called circus stunts during the past few months. The success of the aeroplane appears to hinge upon its ability to perform feats of stability and endurance. Practically all of the constructors are now, and have been for some time, working along these lines.

Universal lighting means the safe use of public ways at night. It need not inflict unreasonable restrictions on anyone. Why not follow Massachusetts' example?

THE TOURING SEASON.

There is every indication that 1912 is to be the greatest touring season the automobile industry has known. Business organizations throughout the entire country, and particularly in the West, have been extremely busy during the past winter in formulating plans which shall offer special inducements to American motorists, that they be encouraged to spend their vacations at home. "See America First" has become a national watchword.

The need for more uniform motoring laws has been remedied in a measure, but there is yet much to be done. Several legislatures, where work of this nature can be done most effectually, did not meet this year, and while many of those who did convene failed to enact expected legislation, the condition is much more satisfactory than ever before.



Perhaps the most important result of all is the reciprocity provision in the New Jersey law. The victory in this one state is sufficient to offset the failure to secure more liberal statutes in others. And when the whole situation is summed up, there is cause for congratulation in the fact that no state, thus far, has seen fit to change its regulations to the detriment of motoring. Of course, Massachusetts is yet to be heard from in this regard.

A word might be said with respect to universal lighting, easily one of the most important subjects affecting highway safety. Motorists will do well to agitate this subject energetically during the coming year.

Advocate the use of lights on all vehicles using the public ways during the hours of darkness.

Electric Lighting of Motor Cars

Outlining Various Systems Employed and Methods of Operation.

By C. P. Shattuck

Part VI—The Rushmore Lighting System.

IT HAS been pointed out that the current output and voltage of dynamos of the ordinary type vary with the rotative speed of the armature, this fluctuation being due to the constantly changing speeds of the internal combustion engine propelling the automobile. Designers of electric lighting systems applicable to the motor car have overcome this difficulty by incorporating different devices to regulate the current flowing to the battery or lamps or both, and several of these types have been outlined in previous installments. When a mechanical generator is employed to

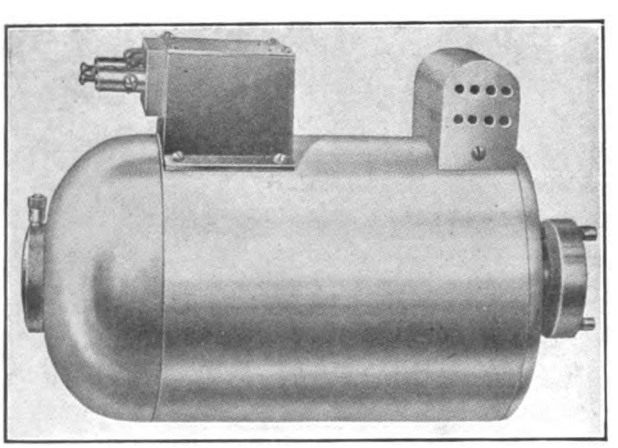

Fig. 40—Rushmore Dynamo, Having but One Moving Part, Which Supplies a Substantially Constant Current and Is Self-Regulating.

charge storage batteries and the latter utilized to supply current to the lamps, a substantially constant current is desired although the commercial battery of today permits of some variation.

Control of Current.

A device for controlling the charging current, which differs from those of ordinary construction, is noted in the electric lighting system manufactured by the Rushmore Dynamo Works, Plainfield, N. J., which produces a variable speed, constant current generator for motor cars and trains. It consists of the application of the high positive temperature resistance coefficient of iron and is the discovery and patent of S. W. Rushmore, who after much experimentation, found that iron possessed the desirable property of increasing greatly in electrical resistance from a certain critical temperature just below red heat. Below this point it is stated that the resistance is practically constant, and at or beyond, it increases and is augmented with each degree of temperature. While a thin coil of wire might be inserted in the circuit it was found that the surplus energy was wasted in heat at higher speeds and that a heavy machine would be required, since the shunt field winding would receive the full voltage normal to the speed at any moment.

Between the armature brushes of the generator and the storage battery to which it supplies current, is connected an iron wire resistor, the resistance of which increases rapidly when the current exceeds a certain value. An indication of this characteristic as claimed by the inventor is presented at Fig. 43, the curve showing that the voltage across the terminals of the resistor increases from 1.5 to 7.5 when the current increases from 12 to 16 amperes; that is to say, with an increase of 33 per cent. in the current the resistance increases 375 per cent., and the consumed voltage by 400 per cent. Thus even with constant field excitation, automatic increase in the resistance of the resistor would tend to limit the current delivered by the generator to the battery, although with extreme variation in generator speed, as with motor cars, the energy loss in the resistor would be excessive.

Function of Resistor.

The increase in voltage across the iron wire resistor is also used to produce a proportional decrease in the field excitation, so that the voltage of the generator tends to remain nearly constant, independent of the speed at which it is driven, and it is claimed that the energy loss in the resistor is but a small proportion of the total output. In shunt with the iron wire resistor is a field coil, the electromotive force of which is in a direction to oppose that of the

Digitized by Google

main field coil which is connected directly across the terminals of the battery.

The resistance of the field or "bucking" coil is considerably greater than that of the ballast resistor when the latter is cold, or slightly heated. When the ballast resistor becomes heated with current its increased resistance forces the bulk of the current delivered by the generator to pass through the "bucking" coil, thereby augmenting the counter excitation produced by the latter. As the strength of the magnetic field is due to the difference between the exciting effect of the main shunt field winding and the "bucking" coil, by suitably proportioning the latter and the ballast coil to the other elements, it is claimed the variation in the current may be as small as desired.

At Fig. 40 is depicted the dynamo, which is designed to produce a small battery voltage at speeds of the automobile engine as low as 200 revolutions a minute. At higher speeds the current, but not the voltage, increases rapidly until about 12 amperes is reached, this corresponding to a car speed of about 15 miles an hour. At higher ratios the current remains approximately constant and the maximum is 14 amperes.

Components of Dynamo.

The dynamo is made in two sizes and these are numbered 1 and 2, respectively. The former is recommended for ordinary purposes and operates at from two to 2.5 times the crankshaft speed of the gasoline engine. Its capacity is 12 amperes at 6.5 volts and the instrument is eight inches long, exclusive of coupling, 5.5 in diameter and weighs 24 pounds. The other model delivers 15 amperes at 6.5 volts, is 10 inches long, six in diameter and weighs 35 pounds. This generator is driven at or about motor speed.

The dynamo has but one moving part, that of the armature, and the entire field magnet circuit, which also constitutes the main frame, is a simple steel shell, which is produced by cutting off and reaming to size a section of standard cold drawn seamless tubing. An end view of this member is shown at Fig. 41 A and the location of the field coils and drawn steel pole pieces is also outlined. These components are illustrated at B and C, respectively. The pole pieces are sections sliced off a steel bar cold drawn to exact shape. The field coils are wound in metal forms and are held in place by the pole members which they surround. The brass end castings, which carry the brush holders and ball bearings are shown at F and the simplicity of the parts and method regulating the tension of the brushes upon the commutator will be noted.

Automatic Cut-Out.

An automatic cut-out of the conventional type is provided, this member serving to connect the dynamo to the battery when the proper speed is reached, also to disconnect it when the voltage of the generator falls below that of the battery. This device is depicted at Fig. 42 A, and prevents the battery from discharging through the dynamo when the voltage of the latter is less than that of the former. The regulator is mounted upon the top of the dynamo in a little iron box, making for compactness and simplicity. The only device to be mounted upon the dash consists of the switch shown at B so that when current is not desired from the generator the field circuit is opened. It is a simple four-pole charging switch which is arranged to open both the main supply and dynamo field circuits, so that the generator runs "dead" and it is claimed that it consumes no power when not in service.

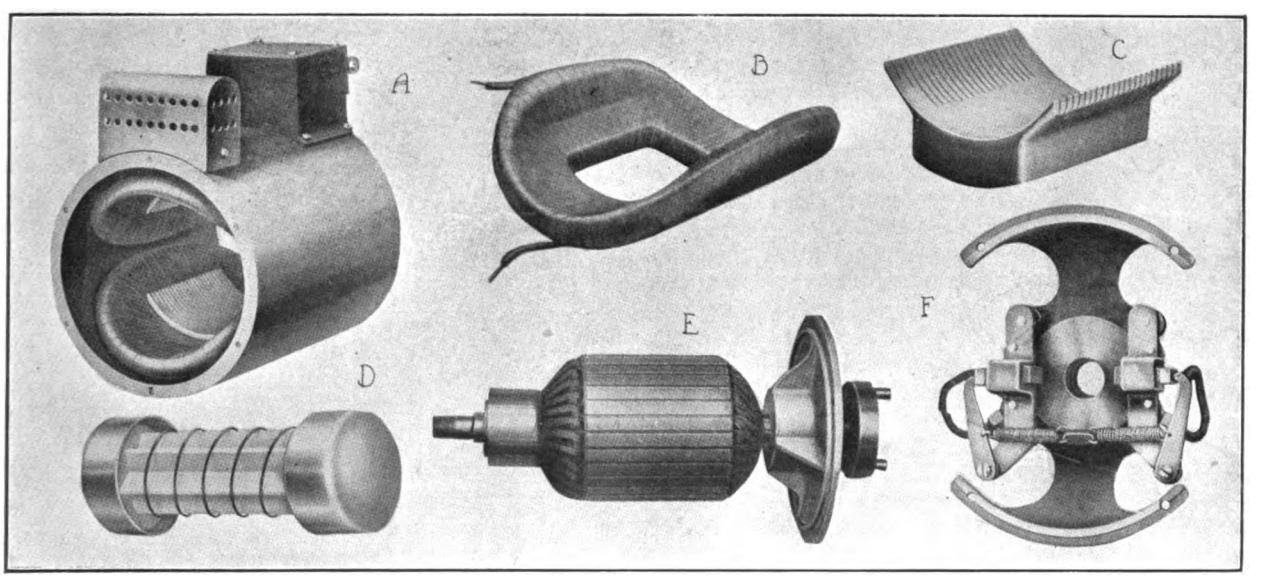

Fig. 41—Components of the Rushmore Dynamo: A, End View Showing Field Coil and Pole Piece, B and C; D, Ballast Coil; E, Armature; F, End Bearing and Brush Holders.

Operation of Ballast Coil.

Although the Rushmore dynamos are rated at

Digitized by Google

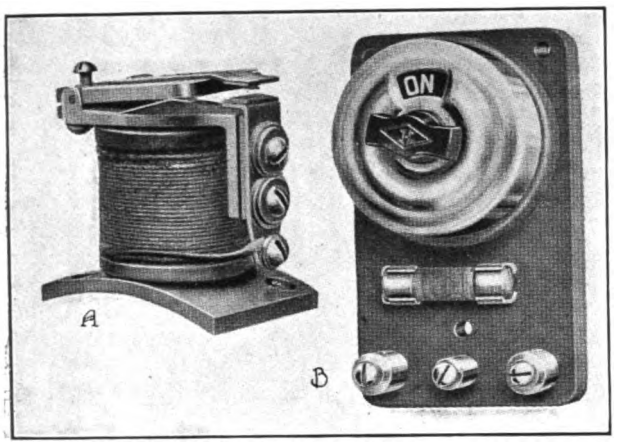

Fig. 42—Controlling Members of Rushmore Equipment: A, Automatic Cut-Out; B, Dashboard Switch.

their maximum normal output, they may be adjusted easily to give the current output desired. By simply removing the little iron ballast coil, which is shown at Fig. 41 D, and which is in the form of a cartridge fuse, the dynamo becomes a simple differential machine and will deliver practically a constant current of about 4.5 amperes at all speeds. The effect of the ballast coil is to form a shunt across the terminals of the field or "bucking" coil, and by providing spare ballast members of different capacities the machine may be regulated to deliver a current of a few amperes. This arrangement makes for a low consumption of current when the car is operated about the city and when the side and tail lamps are in service.

It is held by the maker that the dynamo requires no other attention than oiling a few times each season, that as all parts are fully enclosed it is impervious to moisture or foreign elements, that there is no sparking at the brushes and that these members and the commutator do not require any attention whatsoever. The instrument may be used readily in connection with a storage battery ignition system and the usual magneto discarded. When used as such the change involves but the altering of the magneto platform to meet the requirements of the dynamo. The maker recommends mounting the latter by boring its supporting platform to the radius of the field shell, and clamping the instrument by means of a holding strap.

It is pointed out that owing to the fact that the current, and consequently the voltage, remains nearly constant with increasing speed, the torque required to drive the dynamo actually decreases with this increasing speed. If a belt be employed it is only necessary to drive the dynamo without slipping at a speed corresponding to about 600 revolutions of the crankshaft of the gas engine, at which speed the ballast coil reaches its critical temperature. From that to the maximum speed the torque will fall off almost directly as the rise in speed, in spite of the slight increase in current and voltage, and this pronounced decrease in torque is said to more than offset the decreased belt cling due to centrifugal force.

Suitable Battery.

Any standard 80 or 100-ampere, six-volt battery may be utilized with the dynamo, the equipment not including these members or lighting switches, wires or lamps, although the company manufactures an excellent line of head, side and tail lamps. The latter are fitted with tungsten bulbs of two candlepower while the side members are equipped with two or four candlepower bulbs. The headlights are furnished with 15, 20 or 25 candlepower lamps, although on special order members are constructed for lamps of 50 to 75 candlepower.

(To Be Continued.)

REDUCTION IN TIRE PRICES.

A further reduction in tire prices, ranging from 20 to 25 per cent. went into effect with most of the manufacturers throughout the United States early in the month. The price of crude rubber and increased factory facilities are given as the reasons for the change.

CLEVELAND AUTOMOBLE CLUB.

The Cleveland Automobile Club, Cleveland, O., has undertaken a membership campaign, in which it is issuing a neat folder setting forth 12 pertinent reasons why motorists of that city and vicinity should become identified with this progressive organization. The officers of the club are: President, Fred C. Wood; vice president, Thomas P. Cagwin; treasurer, W. H. Wherry; secretary, Fred H. Caley; directors, W. C. Baker, F. J. Baird, H. M. Adams, T. P. Cagwin, M. L. Lawrence, R. C. Wetmore, W. H. Wherry, H. L. Vail and F. C. Wood.

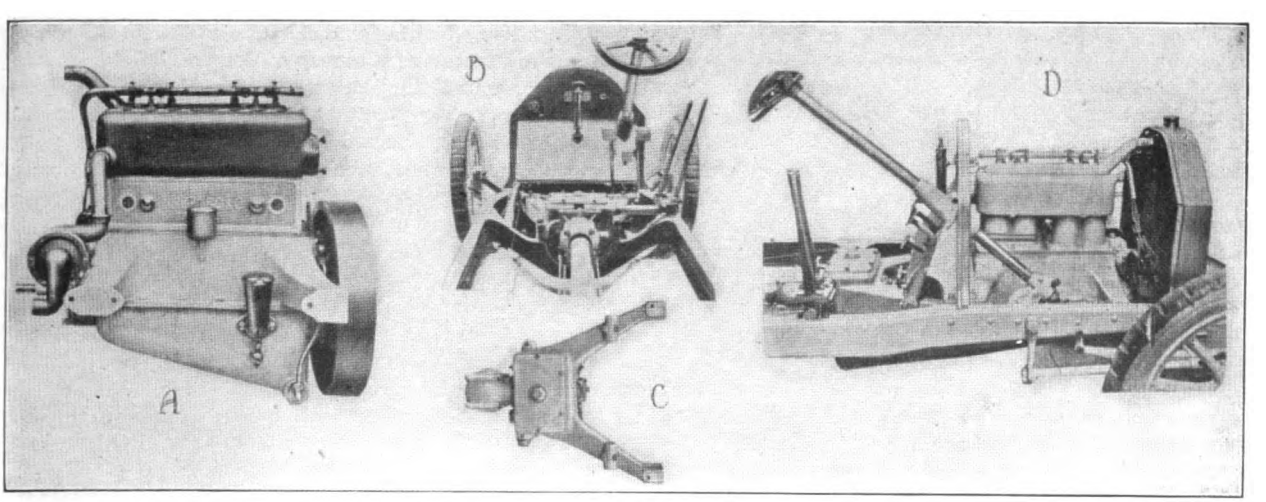
Digitized by Google



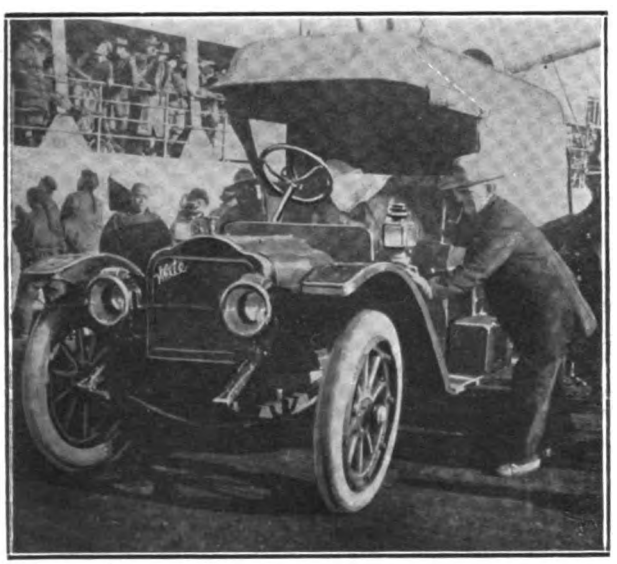
Considerable interest has been manifested in this country concerning the new car upon which Felice Nazzaro of Italy has been working during the past year. The numerous racing events in which Nazzaro has taken part in the United States have served in a measure to bring his work more generally to the attention of the American people, and it also is remembered that he has been studying matters of design in some of the best known plants here. The Nazzaro chassis does not reflect many American ideas, however, and may be regarded as entirely new. Accompanying illustrations set forth some of the distinguishing features.

The chassis is fitted with a four-cylinder motor, cast en bloc, with bore of 100 mm and stroke of 140 mm, rated at 20-30 horsepower. All valves are on one side, neatly encased. The Bosch magneto is driven from a cross shaft in front of the engine, on the other end of which is the water pump. The oil pump is driven separately off the camshaft, and is of the rotary gear type. Oil is circulated through the hollow crankshaft and the pump is easily detachable. The two-jet carburetor is so located that the mixing chamber is encased with the valve operating mechanism between the second and third cylinders, and only the float chamber is visible until the cover plate is removed.

The clutch is of the multiple disc type, and can be removed without disturbing the four speed gearbox. The latter is very small, and like the motor is suspended at four points. Though quite an independent unit, it is to all intents and purposes one with the engine, as it is carried at the back on the top of the central inverted arched member of the main frame, and in front by two wide spreading arms which are bolted to the chassis frame sides and abut against the two rear arms of the crankcase. The engine and gearbox are further united by the cast aluminum dash and the rear of the bonnet, which has wide spreading feet that bolt to both engine and gearbox arms. By this arrangement both units are kept in alignment, although it is said that either may be removed without disturbing the position of the other.

The inverted arch mentioned is the only cross member of the frame, except those at the extreme ends. The propeller shaft is enclosed in a tube with a spherical front end, which takes the driving thrust to this central frame member and also serves as the torque tube. The bevel driven rear axle is of the sleeve type, and these sleeves are of pressed steel.

Features of Nazzaro Chassis: A, Left Side of Motor; B, Inverted Arch Construction on Which Gearbox Is Suspended; C, Gearbox with Wide Spreading Arms; D, Right Side of Dash and Motor Assembly.



Digitized by Google

The universal joint within the spherical head of the propeller shaft casing is hung on ball bearings. The rear springs are three-quarter elliptic, and all brakes are located on the rear wheel hubs. These are of the expanding band type, and are placed side by side in a large flanged drum in either wheel, these latter being of hollow stamped steel.

★

The progressiveness of the preesnt government of China is being reflected in its interest in automobiles. Great Britain reports that many inquiries for information have been received from all parts of the new republic, and it would appear that a splendid market is to be opened there in the near future.

Pleasure cars have been in more or less constant service in certain sections for some time, but the first truck to appear in northern China was the White, made by the White Company, Cleveland, O., and shown in the accompanying illustration. This machine is

White Truck at Chin Wang Tao, North China.

owned by the United States government and is in constant use in the Philippines, along with many others of the same make. When the American forces were sent to China during the recent disturbances, this car was sent with them as a commissary wagon.

The photograph shows the machine upon its arrival at Chin Wang Tao, as it was being prepared for its journey inland. As might be expected, it attracted widespread attention from the natives and it hardly needs to be added that the business men of the new China watched its performance with much interest.

★

Members of the Royal Automobile Club of Great Britain report that upon a recent visit to France they were informed that visitors staying at a hotel "en pension" must give three days' notice to the proprietor, or the latter is entitled to charge for three full days' board for the entire party. Inquiry among the legal fraternity in Paris results in the statement that it is the custom in France to accept notice given on any day before noon, and that any demand for three days' notice is not recognized in law. Motoring tourists are advised to be on the guard in this matter.

★

Eight years ago Miss Laura B. Starkey of Eastbourne, England, took her first lesson in driving a motor car, being among the first women in the British Isles to take up motoring. Her first machine was a 6.5 horsepower Peugeot, in which she took at least one long drive of 140 miles. Miss Starkey has just received her sixth machine, a 12-16 horsepower Sunbeam, with seating capacity for five persons.

★

Christchurch, New Zealand, has been enjoying its first reliability run, in which the contestants covered 300 miles, crossing numerous rivers and traversing rough mountainous country. Three Minerva cars finished first, second and third.

★

The first commercial vehicle operated by the banana growers of Jamaica was purchased recently in Baltimore, Md., this being a three-ton KisselKar, made by the Kissel Motor Car Company, Hartford, Wis. The results were so satisfactory that a repeat order has been placed with this concern for two more machines of the same capacity. The success of the American car in this work has aroused the interest of British manufacturers who already have begun to exploit the market.

★

The Chilean government has reduced materially the duty on automobiles, the new law going into effect last month. Under the present arrangements customs officials will collect 15 per cent. ad valorem instead of 60. The old classification was under the general heading of vehicles, while the new law provides specifically for motor cars, and it would appear that there is to be increased activity in the exploitation of such machines for all classes of service.

★

Flanders Colonial electric cars, made by the Flanders Manufacturing Company, Pontiac, Mich., are to be represented in Palestine, St. Petersburg and Christchurch, New Zealand, under a new arrangement which has been perfected by C. Piquette Mitchel, manager of the foreign department of the company. In addition, it is reported that this concern is doing a splendid business in Germany and France.

With regard to electrics, Mr. Mitchel says that foreign purchasers recognize that America leads in all branches of electrical development and that the pleasure cars of this type made in the United States are conceded as being far in advance of those constructed abroad. He adds:

"It is a fact not generally known that in several German cities gasoline cabs are not permitted on the streets. Electrics therefore have a great advantage. Inasmuch as we do not produce cabs we cannot avail ourselves of this peculiar condition, but we find that the legislation against vehicles for hire also has mili-

Digitized by Google

tated against gasoline pleasure vehicles for city use there, and the electric with its silence and freedom from smoke and oil is rapidly growing in demand.

"Another feature of the Flanders electric that appeals to Europeans is the worm drive. That form of transmission has been much in favor abroad for some time, though we were the first to adopt it in America. Its absolute silence, its greater efficiency, its cleanliness and other advantages over chains and gears are recognized there, as these qualities are rapidly becoming appreciated at home."

★

An automobile course for police officers has been instituted at Vienna by the police presidency, and 180 officials have entered as pupils. The lessons comprise both theoretical and practical instruction, and conclude by the actual driving of cars.

★

The South African Mining Journal of Johannesburg, South Africa, states that the trade in motor cars in that city and vicinity is decidedly brisk, and that there is a good market for prominent makes of machines. The great demand is for cars costing about $1000.

★

The city council of Melbourne, Victoria, Australia, will receive bids until May 15 at 2 in the afternoon, for one electric motor car to accommodate three persons and capable of maintaining when fully loaded an average speed of 20 miles an hour, and two electric motor wagons complete, to carry loads of 2000 and 1000 pounds, respectively. Sealed bids are to be received by the Chairman, Electric Supply Committee, Town Hall, Melbourne.

★

The report of the Hungarian postal authorities for 1911 indicates that the experiment of utilizing motor vehicles has proved a decided success. Several additional light, fast, pneumatic tired vans have been ordered from the Benz-Werke Gaggenau. The first use of motors in the collection of mail in Hungary was begun in 1902, these being motorcycles with sidecars. The postal authorities say that the automobile fleet now in use effects a saving equal to 60 cents a day for each machine, as compared with horses.

★

Evidence of prosperity in Mozambique, Portuguese East Africa, may be gained from the fact that eight motor cabs are in service there, having been in use since 1909. The average business of these machines is about $500 a month. The first cabs purchased were of American manufacture, but these were considered too light, although they are still running. Subsequent purchases have been of German production.

★

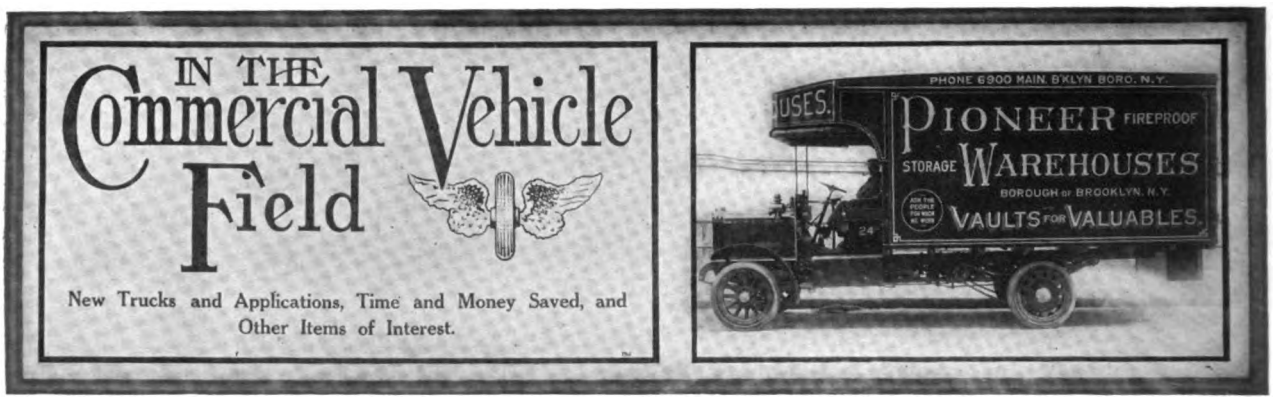
Agents for the Overland cars, made by the Willys-Overland Company, Toledo, O., in Australia have increased their orders for 700 machines to 1200 for the 1912 season. These will be shipped at the rate of 12 cars a day until the entire allotment is taken. A second shipment of 30 Overlands was made from New York early in April.

★

L'Auto has awarded first prize to the three Benz cars in the recent Tour de France. In commenting upon the result of the contest this publication says: "The performance of this team was a revelation to all; for 4000 kilometers these silent, powerful and speedy cars never were more than 50 yards apart; they were always on time, had no mechanical troubles of any kind, and were voted the most beautiful cars of the whole 62."

PERFECTED REMY MAGNETO.

The accompanying illustration is that of I. J. Reuter, chief engineer of the Remy Electric Company, Anderson, Ind., to whom the company gives credit for developing and perfecting the present type of inductor magneto made by this concern. He succeeded President B. Perry Remy as engineer previous to the sale of the Anderson Electric Company.



I. J. Reuter, Chief Engineer Remy Electric Company.

The new RD type of inductor magneto, bearing the Remy name, is the result of Mr. Reuter's genius. He has improved and refined the product of the company in many ways, among which may be mentioned the use of Bakelite instead of hard rubber for insulating material. He also has reduced the size of the instrument without decreasing its efficiency. Another improvement is the substitution of ball bearings, and one of his latest achievements is the new vibrator coil, especially adapted to self-starting devices, by means of which a shower of sparks is shot into the cylinder about to be fired, instead of the usual single spark.

Mr. Reuter was at one time designing engineer for the Willys-Overland Company, Toledo, O., and is more or less well known in the industry. He graduated from Purdue University in 1906 and is a member of the Society of Automobile Engineers and of the Indiana section, S. A. E.

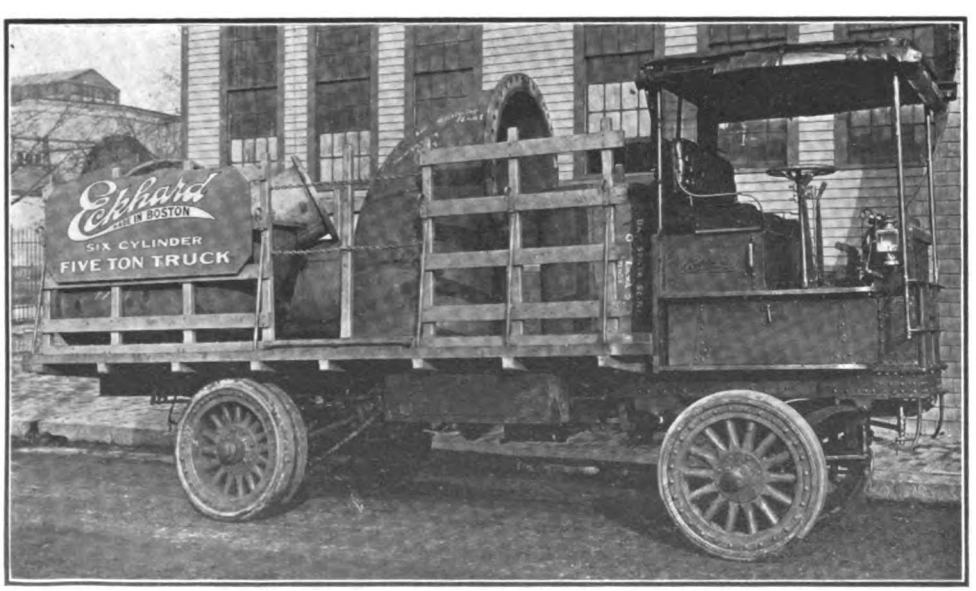
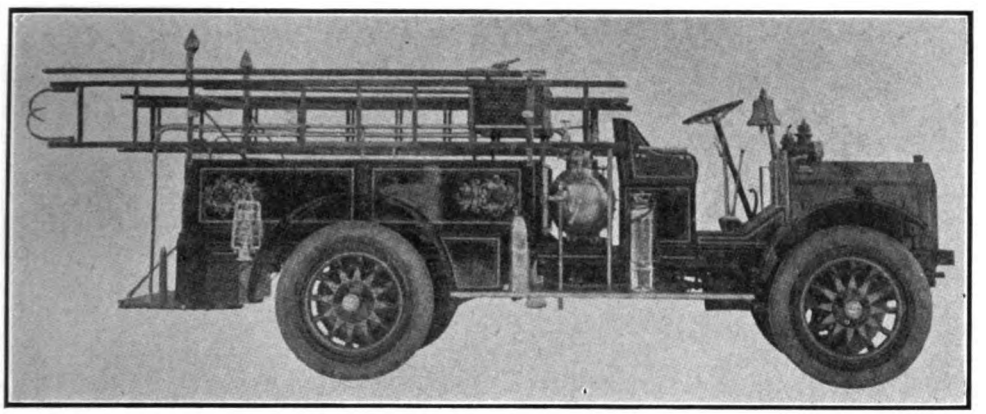
ECKHARD SIX-CYLINDER TRUCK.



A five-ton vehicle which attracted considerable attention during its initial appearance at the recent Boston show was the six-cylinder Eckhard, made by the Hercules Motor Truck Company of that city. It is somewhat surprising to find an engine with six cylinders in a commercial vehicle, but the designer of this model, John Eckhard, who is not entirely unknown in the pleasure car field, expresses himself of the opinion that within a few years all the heavier machines will be thus equipped. However, the power plant is not the only interesting feature of the Eckhard.

The motor is of the valve-in-the-head type, with cylinders cast in pairs. The bore is 4.5 inches and the stroke five inches, giving an S. A. E. rating of 49.6 horsepower, although the maker claims it has developed 54 horsepower by brake test. The assembly is installed in a sub-frame that is mounted at the forward end of the heavy chassis frame, and is supported at either side by swivelled links from a wide yoke that is pivoted on a frame cross member.

The driving system is unique in that there are two cone clutches between the motor and the differential. These clutches are very large and both are of the reverse type. Between the forward member and the transmission is a universal joint, and the connection with the mainshaft of the transmission is flexible. The second clutch is between the differential and an extension of the main transmission shaft. There is an interlocking system by means of which when the clutches are disengaged, the transmission shaft is brought to an instant stop by a brake, and change of speed can only be made when the transmission gears are not moving.



The transmission case is carried in a sub-frame, the forward end of which is suspended by swivelled links from the arms of a yoke pivoted to the heavy cross frame member, exactly in the same manner as with the motor. The rear end is suspended from a cross member behind the jackshaft. Final drive is by double side chains.

Extending from the centre of the rear axle to the centre of the front axle is a long rod that is fitted with a heavy spring buffer at the forward end. The function of this device is to carry the drive of the rear wheels to the forward axle, to distribute the road shocks on the front wheels to the rear construction, and to prevent unequal movement of the axles. In this respect it serves as a distance rod and has precisely the same effect as have the perches of the animal wagon. To prevent the turning movement of the rear axle, resulting from driving and brak-

Digitized by Google

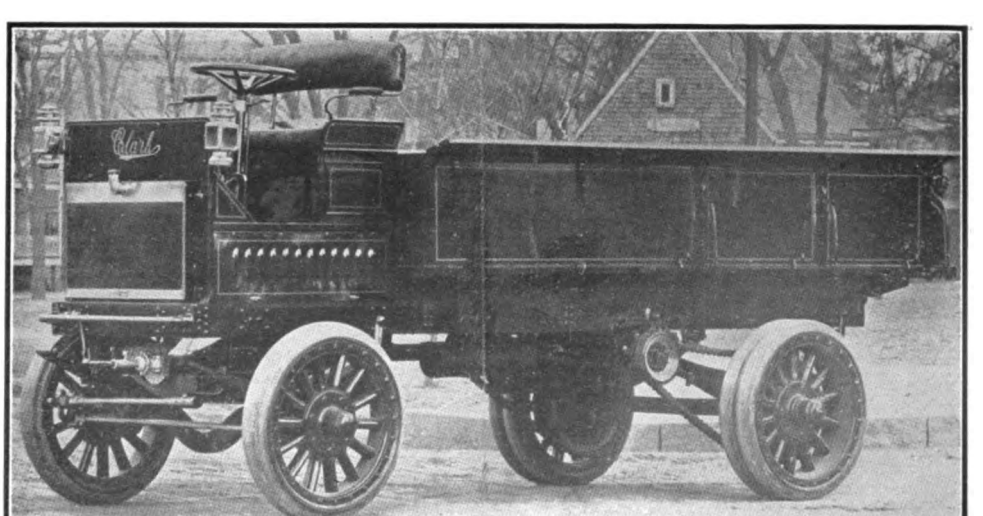
Kelly 1.5-Ton Chassis Equipped as Combination Hose and Chemical Wagon.

ing action, a torsion chain is used, this being attached to the centre of the rear cross member of the frame and extended to the end of the stout arm mounted on the centre of the rear axle.

The frame is of heavy steel channel section, strongly reinforced and hot riveted. The wheels are 40 inches in diameter and the tires are six inches, being single in front and dual in rear. The wheelbase is 144 inches. Brakes are contracting and expanding on the jackshaft and rear wheel drums. Ignition is by two independent systems, with a double set of spark plugs. A Bosch high-tension magneto supplies the current for one, and a storage battery for the other.

KELLY FIRE WAGON.

The Kelly Motor Truck Company, Springfield, O., has been specializing in fire apparatus for some time, and a large number of these vehicles is in general use throughout the country. An accompanying illustration presents the standard model, fitted to a regulation 1.5-ton chassis, this being a combination hose and chemical wagon, with capacity for 1200 to 1500 feet of 2.5-inch fire hose and a 40-gallon chemical tank.



It will be noted that the body is extra long, with a 16-inch step at the rear. The tool box is located at the rear, and is equipped with spring hinges and lock and a drop door. The tank is made of the best cold rolled Lake Superior copper with the heads hammered, and is equipped with all the latest improved bipasses, valves, agitators, etc. All parts are nickel plated, including the tank itself.

Other equipment of the car includes: Two three-gallon extinguishers with brass receptacles carried on the running boards, a hose basket of perforated steel and ventilated bottom fitted with brass rollers, 200 feet of the best chemical hose, shut-off nozzle, 20-foot trussed extension ladder, 12-foot roof ladder with folding hooks, eight-foot combination plaster hook and pike pole, door opener, 10-inch locomotive gong or automatic multiple stroke gong, two axes, crowbar, two lanterns, two torches, two nozzle plugs, etc.

LATEST CLARK DESIGN.

While Edward S. Clark of Boston is best known in the industry as having specialized in the construction of steam pleasure cars, it is remembered that he brought out a gasoline power wagon equipped with a two-cycle motor about a year ago. However, this has been abandoned for two new models, one of three tons capacity and the other of five, which are being produced with four-cylinder, four-cycle engines. The accompanying illustration presents the three-ton vehicle.

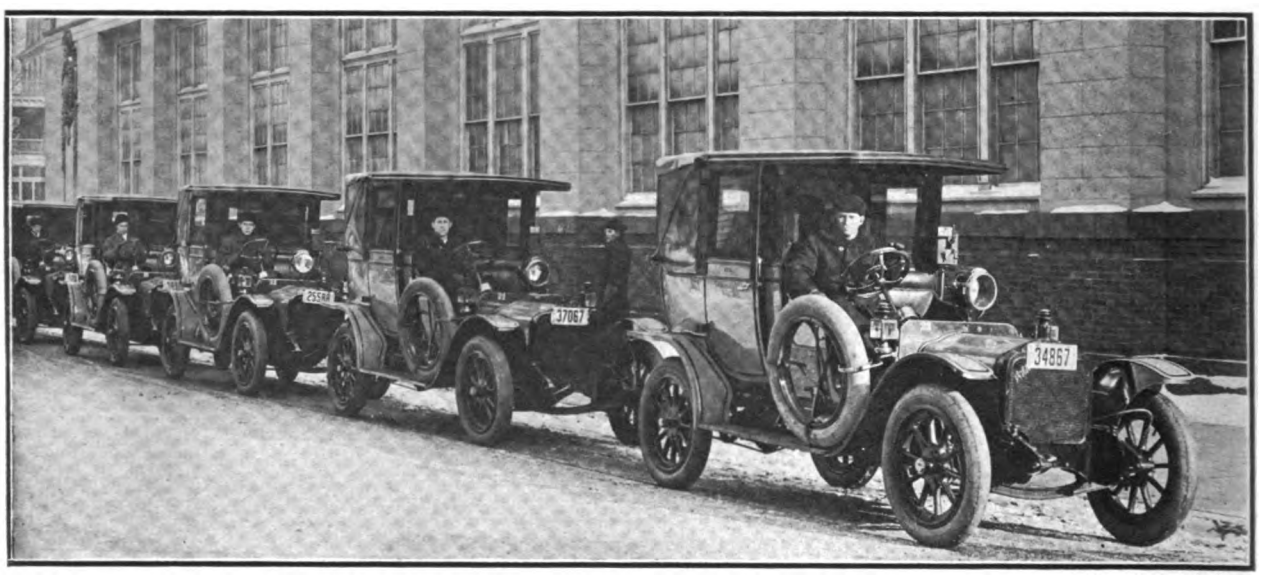
In this the motor is cast en bloc with bore of 4.125 inches and stroke of 5.5, giving a rating of 35 horsepower. The casting is carefully finished and exceptionally fine workmanship is noted throughout the entire assembly. The water jackets are of liberal size and the cooling fluid is circulated by means of

Latest Clark Three-Ton Vehicle Fitted with Standard Furniture Body.

Digitized by Google

a large centrifugal pump. The vertical tube radiator is of large dimensions and cooling is further aided by a belt driven fan mounted forward of the engine.

Lubrication is accomplished by two gear driven pumps operated by the camshaft. The oil is carried in a reservoir in the bottom of the crankcase, and from this it is drawn through filters and circulated through a system of tubes to a sight feed on the dash, and thence to the main bearings. Ignition is by a dual system, employing a Bosch high-tension magneto, special care being taken to protect all wiring from wear and saturation by water and oil. The carburetor is of the float feed type, provided with a water jacket to insure uniformity of mixture.



The clutch is a cone member, and under the leather facing flat springs are installed to prevent harsh engagement. The drive is by shaft to a Timken rear system, through a large jackshaft and double side chains to a dead rear axle. The transmission is of the selective type affording three speeds forward and reverse, it being fitted with Timken adjustable roller bearings throughout. The jackshaft is equipped with a locking device by which the differential may be locked and the rear wheels driven as a unit in the event of unequal traction. This arrangement is operated by a lever located at the left side of the chassis frame.

The service brake is on the jackshaft, operating on drums 12 inches in diameter and 2.25 inches in width, being actuated by pedal. The emergency member is expanding on rear wheel drums, 18 inches in diameter, operated by a hand lever which may be set by a pawl and notched quadrant.

The frame is six-inch rolled steel channel section, 42 inches in width and the length is proportionate to the body. The standard wheelbase is 120 or 130 inches, and the tread 68 inches. The frame is constructed with heavy cross members and is strongly braced. Springs are semi-elliptic, front and rear, the former being 42 inches long and the latter 52. The width is three inches. In addition the rear suspension is fitted with a heavy cross spring. The front axle is a drop forged steel, I section and the rear rectangular steel, 2.25 by 3.625 inches. The wheels are 36 inches in diameter, mounted on Timken roller bearings, with 36 by five-inch solid tires in front and 36 by four-inch dual members in the rear.

WHITE CABS SUCCESSFUL.

During the past year the White Company, Cleveland, O., maker of White pleasure and commercial lines, has been devoting a large part of its attention to the construction of taxicabs, having spent much time and effort in studying the needs of this particular field, both in this country and abroad. Herewith is shown a portion of the fleet of White cabs, operated by the Cleveland Taxicab Company of that city, which has found these machines very successful, both from the viewpoint of economy and efficiency.

White Taxicabs Operated by the Cleveland Taxicab Company with Splendid Success in Cleveland, O.

PEERLESS IN EXPRESS DELIVERY.

Express companies are looked upon as being thoroughly conversant with the needs of the transportation business. They must be supplied with absolutely dependable means of conveying goods at both the collecting and distributing ends, and when it is known that many of these concerns are replacing their horses with motor trucks, their action is worthy of consideration.

Some time ago the American Express Company, one of the leading organizations of its kind, decided to test out the Peerless truck, made by the Peerless

Digitized by Google

Motor Car Company, Cleveland, O., and purchased five. These were given severe usage and engineers and traffic experts watched them carefully, making thorough estimates of their performances in comparison with horses and with other commercial vehicles.

The result was wholly gratifying to the Peerless company, as well as to the purchaser, judging from the fact that a repeat order for 11 machines has only recently been filled. The accompanying illustration shows a part of this fleet at the Peerles factory ready for the installation of special bodies.

INTRODUCING MOTOR PLOW.

California farmers are much interested in the demonstration of a new motor plow recently introduced in that territory by the Hackney Manufacturing Company, St. Paul, Minn. This machine is the invention of the president of the concern, Leslie S. Hackney, and is 14 feet long and six feet five inches wide. It is equipped with a four-cylinder, four-cycle motor, having a bore of five inches and a stroke of six. It can be utilized for a number of purposes, inasmuch as the plowshares are so arranged that they may be raised clear of the ground, when the machine becomes a tractor in every sense of the word.

COLORADO WOMAN MAKES TRUCKS.

Mrs. Nettie C. McIntyre of Denver, Col., claims to be the first woman in the country to engage in the manufacture of commercial motor vehicles. Until recently her home was in northern Colorado, and while on a business trip to Wichita Falls, Tex., she became interested in the invention of C. A. McKiernan of that city. Her knowledge of haulage problems led her to believe there was a splendid future in the truck field, and she enlisted the financial support of J. A. Kemp and Frank Kell in the organization of the Wichita Falls Manufacturing Company.

The first vehicles, of one and two tons capacity, were shown at the recent display in Kansas City. Their success seems to be assured, in view of the fact that 25 machines were sold during the progress of the exhibition. The Wichita Falls truck was next exhibited at Denver, where the Wichita Falls Motor Sales Company has been organized for the purpose of looking after the retail business in that city and vicinity.

TRUCKS FOR RAILROAD WORK.

The Groton & Stonington Street Railway Company, Groton, Conn., contemplates the installation of motor trucks in making delivery from its express trolley cars. The company handles considerable freight for a number of manufacturing plants, and these have asked for spur tracks leading into their yards. The trolley company thinks that by using automobiles it will be able to save expense and improve the service at the same time. A trial has been given, and the demonstration of the vehicle was satisfactory in every respect.

Part of a Fleet of Peerless Trucks Recently Placed in Service with the American Express Company.

SAURERS IN PORTO RICO.

After a thorough investigation of commercial vehicles for hauling freight long distances over poor roads, the Porto Rico Motor Company of San Juan and Ponce, Porto Rico, has ordered 30 five-ton Saurer trucks, made by the International Motor Company, New York City. These machines will be used in competing with railroads throughout the island, and the plans call for maintaining a given schedule covering many of the principal towns.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

Digitized by Google

It is expected that prizes aggregating $100,000 will be offered for competition in the 1800-mile cross country American circuit race, which will precede the international race for the Gordon-Bennett cup at Chicago in September. In staging this event the Aero Club of America will be assisted by the aero clubs of Illinois, Michigan, Milwaukee, Kansas City, St. Louis, Indiana, Cincinnati and Ohio.

Both the start and finish probably will be at the Cicero field, Chicago, where the international race will be flown. As now proposed, the race will be by daily stages, with controls as follows: Milwaukee, Cedar Rapids, Des Moines, Omaha, St. Joseph, Kansas City, Jefferson City, St. Louis, Charleston, Indianapolis, Cincinnati, Columbus, Cleveland, Toledo and Detroit.

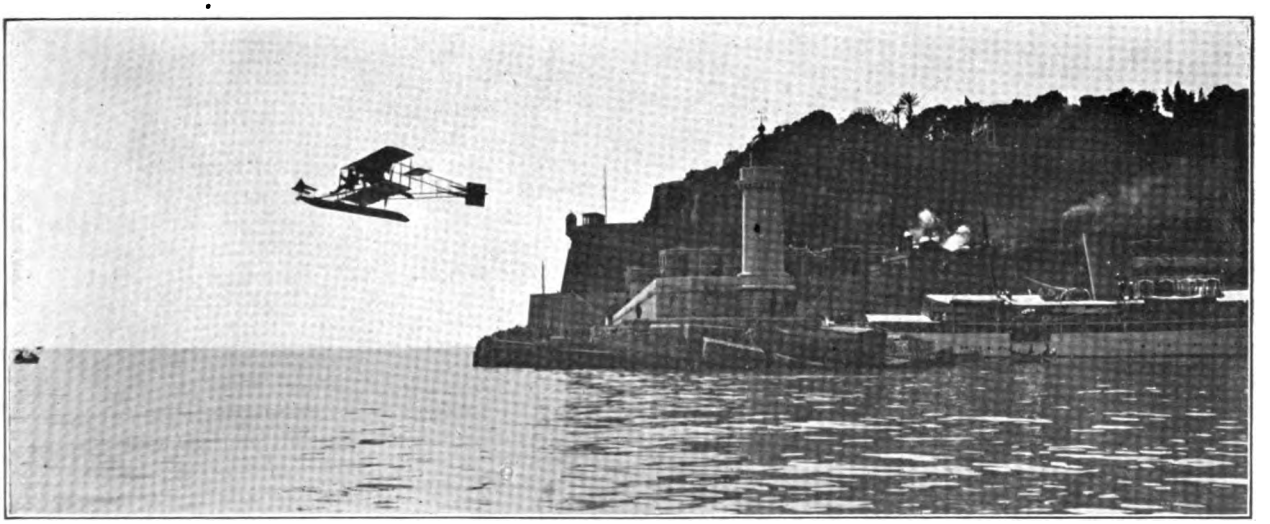
An accompanying illustration is that of a decidedly novel monoplane constructed by Marcel Besson of France. No information is at hand as to how this machine has performed in flight, but there appears no reason why it should not prove entirely practical.

The principal feature is the formation of the wings, which are turned up slightly at the extreme ends. The arrangement of the pilot's cockpit and the motor and radiator mounting are not exactly clear in the photograph, but it would appear that this entire assembly was enclosed in the covered-in portion between the two sections of the main plane.

It will be noted that the fuselage is covered throughout its length, and the position of the skids of the landing chassis is such as to convey the impression that the machine is intended to be flown tail foremost. Still another feature is the method of carrying the empennage on a combination wheel and skid arrangement, which still further suggests a direction of flight opposite to that ordinarily expected.

The workmanship throughout is worthy of special comment and further developments with the Besson monoplane will be awaited with interest.

Commander Cleland Davis, U. S. N., has invented a new gun with which he expects to arm military aeroplanes. The new weapon is designed to destroy foes in the air, or to attack an enemy on the ground from a height where a gun, gunner and aeroplane will be an almost invisible target. It fires a 33-pound projectile and is said to have no perceptible recoil. The material is vanadium steel, and the gun is 12 feet long, weighing 150 pounds.



Novel Monoplane Produced by Marcel Besson in France, Which Presents Several Features of Originality in Construction.

Digitized by Google

In a test held on a barge near Fisher's Island, N. Y., recently several United States military and naval officers were present. The gun was mounted on steel springs and was fired twice. Although the springs were of delicate moid, there was no recoil after either discharge. The test was in every way satisfactory, and arrangements are now being made for its further exploitation.

Hugh A. Robinson has returned from Europe, where he went to place a Curtiss hydraeroplane with the Russian government and where he took part in the first hydraeroplane meet ever held, at Monaco. An accompanying illustration shows Robinson and his Curtiss in flight off Monte Carlo. It develops that the rules for this competition were purposely made easy so as not to eliminate the French machines, which are mostly ordinary biplanes fitted with special pontoons.

The chief award was won on passenger carrying

Hugh Robinson of America, Flying a Curtiss Hydraeroplane at the Recent Meet for Air and Water Craft at Monte Carlo, Monaco.

points, many of the foreign machines being able to carry three or four persons, while the Curtiss hydraeroplane was never designed to carry more than two, this being all that the United States navy has required.

The first international aviation exhibit under the auspices of the Aero Club of America will be held in the new Grand Central Palace, New York City, May 9-18, and this promises to be the most representative showing of aeroplanes and hydraeroplanes ever held in this country. The list of exhibitors is by no means complete, but John Carrington Yates, under whose management the event is to be held, announces the following:

Aeroplanes—American Aeroplane Company, monoplanes; American Aeroplane Supply House, Bleriot type monoplane; Curtiss Aeroplane Company, two Curtiss biplanes, one with dual control; Christmas Aeroplane Company, Christmas biplane; Gallaudet Engineering Company, two-passenger steel monoplane fitted with 100 horsepower Gnome engine; H. W. Jacobs, metal multiplane with two motors; Queen Aeroplane Company, Queen monoplane with 30 horsepower Anzani motor; Rex Monoplane Company, Rex monoplane; Irving W. Twombly, monoplane; Wright Company, Wright biplane.

Hydraeroplanes—Max Ams Machine Company; Curtiss Aeroplane Company, Curtiss; Queen Aeroplane Company, Aeroboat; Wright Company, six-cylinder Wright.

Motors—Max Ams Machine Company, eight-cylinder V, 70-80 horsepower M. A. S.; Baby Engine Company, engines for models; Crane Company; Curtiss Motor Company, Curtiss motors, propellers, etc.; Frontier Iron Works, four and eight-cylinder Frontier; C. B. Kirkham, six-cylinder Kirkham; Roberts Motor Company, four-cylinder, 50 horsepower Roberts; six-cylinder 75 horsepower Roberts, 125 horsepower Roberts; B. F. Sturtevant Company, motors, propellers and motor parts; H. L. F. Trebert Engine Works, eight-cylinder V Trebert Justrite; Irving W. Twombly, seven-cylinder rotary Gnome; Mead Engine Company, rotary valve Mead.

Balloons—A. Leo Stevens, small complete hydrogen balloon; Goodyear Tire & Rubber Company, four model balloons and one large scale model dirigible.

Fabrics, etc—Goodyear Tire & Rubber Company, tires, tapes, springs, fabrics, pneumatic hydros; Pennsylvania Rubber Company, Pennacloth, tires; B. F. Goodrich Company, Lumins fabric, tires; Diamond Rubber Company, tires.

Miscellaneous—E. J. Willis Company, supplies, models; Marburg Bros., Inc., Mea magnetos, S. P. O. ball bearings; Electric Speedometer Company, tachometers; W. F. Mangels Company, teaching device; F. A. O. Schwartz, models; White Aeroplane Company, models; W. A. Crawford-Frost, models; G. A.

Crayen & Co., magnalium metal castings.

Loan and historical exhibits—Curtiss 1909 Gordon-Bennett winner, Burgess "Flying Fish," Harkness' Antoinette (first machine to carry war messages), Nieuport monoplane, Davis aeroplane gun, new army aeroplane with 70 horsepower Renault engine built by the Burgess Co. & Curtis, Frank Coffyn's Wright hydraeroplane, Clifford B. Harmon's Henri Farman biplane, Romaine Grassier's Morane monoplane, Paul Lacroix's Paris-Madrid Bleriot winner, George M. Dyott's Deperdussin monoplane, Chanute gliders from Aero Club of Illinois, A. Leo Stevens' Zodiac dirigible, Horace A. Wild's Parseval, exhibit from the United States weather bureau, Law's parachute, A. Leo Stevens' assortment of balloon baskets, balloon basket and equipment loaned by Alan R. Hawley.

The Navy Department at Washington, D. C., has formally notified the Aero Club of America that it will co-operate with that organization in holding the first American hydraeroplane meet at New York City, May 4. This means that the United States government will patrol the course from the pier of the Columbia Yacht Club at the foot of West 86th street to that of the Atlantic Yacht Club at Sea Gate, Coney Island.

The principal event of the day will be a distance speed race, without passengers, which will carry with it a substantial cash award. A handsome trophy, emblematical of aviation presenting man with wings, will be the prize for a passenger carrying speed contest around the Statue of Liberty and return. Other events will include bomb dropping, quick get-away contests, accurate alighting competition, capturing toy balloons, carrying orders as scouts from battleships, etc.

Among the entrants are: Harry N. Atwood, Burgess-Wright; Frank C. Coffyn, Wright; Walter Brookins, Brookins; George W. Beatty, Beatty; Hugh Robinson, Curtiss; Grover C. Loening, Aeroboat.

The British war office has announced the organization of a royal flying corps, somewhat along the lines of the American aeronautical reserve. The corps, of which there will be army and navy wings, will be maintained and administered jointly by the admiralty and war office. The central flying schools will be located at Salisbury Plains. Claude Grahame-White is the first civilian to join the new corps.

Louis Bleriot and a number of military experts in France claim to have discovered that the accidents to monoplanes flown by military aviators in that country recently were due a peculiar strain from above. This in a measure explains the reason for the death of George Chavez, after his successful flight over the Alps, and may aid in explaining some of the mysterious accidents which have taken place in this country.

It will be remembered that at the time of Chavez's death it was announced that the wings of his Bleriot monoplane crumbled up as he was nearing the earth. This seemed impossible to the constructor who has been studying this and subsequent accidents ever since. He is now confirmed in the opinion that the trouble is due, not to the wings, but to the failure of the upper guys, which have not been designed to resist stresses from above.

In most instances, the machine has been so badly damaged that it was impossible to discover the cause. In one of the latest accidents to a military monoplane in France, sufficient information was at hand to enable Bleriot and the others to reach a conclusion. This opinion was borne out by the action of machines in other accidents.

As a result, in the future monoplanes will be tested with a top loading of the wings, as well as a bottom loading. This will mean an entirely new system of upper bracing. Bleriot concludes that it will be necessary to allow a factor of safety three times that now employed for the under surface.

The Paris Matin has announced a special prize for a flying race from Pekin to Paris, a distance of over 7500 miles. Bleriot, Vedrines and others claim the task is quite possible of accomplishment, although it is by no means regarded as easy.

According to a dispatch from Tokio, Japan, a company has been organized for $500,000 for the purpose of manufacturing aeroplanes in that country. It is announced that the stockholders will include Americans and Japanese, the Americans named being Capt. Baldwin and Lee Hammond.

Turkey has purchased an aeroplane for use in connection with the war in Tripoli, and as a result the oath of fealty in the Ottoman army has been changed to read as follows: "I do swear allegiance to the Padishah, on land, on sea and in the air." This new oath was administered last month for the first time to 400 recently promoted officers at Constantinople.

Flying a Morane monoplane, Maurice Tabuteau recently created a new cross country distance record, having gone from Pau to Paris, with one stop at Poitiers, a distance of 447.12 miles in 5:35:00. It is of particular interest to note that the machine was equipped with a Bosch magneto, which is particularly gratifying to the Bosch Magneto Company of New York City.

To Miss Harriet Quimby, an American woman, belongs the honor of being the first woman to fly her own machine across the English channel. Utilizing her Bleriot monoplane she left Dover, England, the morning of April 16, alighting at Hardelet, near Boulogne-sur-Mer, France, in a little less than two hours later. She was unaccompanied on her flight.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

K-W IGNITION CATALOGUE.

What is probably one of the most complete catalogues of ignition devices ever issued is being distributed to those who make application for it by the K-W Ignition Company, Cleveland, O., maker of K-W magnetos and other electrical apparatus for automobile use. Sixty-four pages are devoted to illustrating and describing the various products of the concern, and altogether the booklet is a decidedly interesting compilation concerning the manufacture and use of ignition equipment. Considerable space is devoted to the K-W lighting magneto, and five pages are filled with instructions for fitting this device to cars not already equipped with magnetos. The illustrations are in half-tone and line drawings, and the whole makes a very valuable addition to the motorist's library.

AUTOMOBILE EXPORTS AND IMPORTS.

The export of American automobiles continues to increase at a rapid rate, the figures for February showing that during that month there were 2403 cars exported, or over 100 per cent. more than during February, 1911. The table of values shows that the increase has been among the lower priced cars, the average value of these exported in February, 1911, being $1051, while the average for 1912 was $946. The import figures, which for some time had shown a decided decrease, are coming up, and during February, 73 cars, value $166,048, average $2560, were imported, as against 41, value $104,924, average $2560. The figures, classified by countries, are as follows:

February Exports.

	1911	1912	
Country	Value	No.	Value
United Kingdom	$150,142	664	$534,398
France	28,242	43	39,221

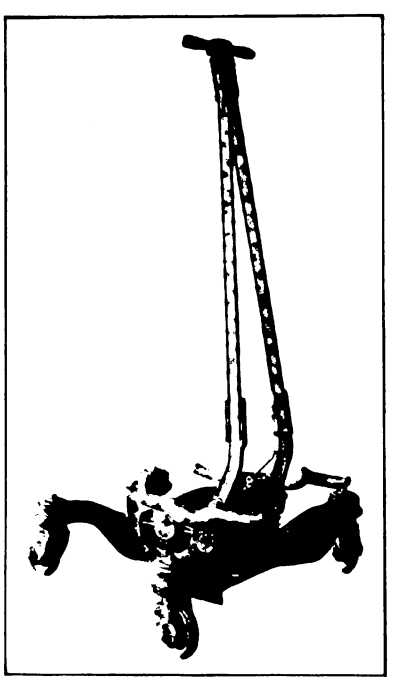
Totals	41	$104,924	73	$166,048

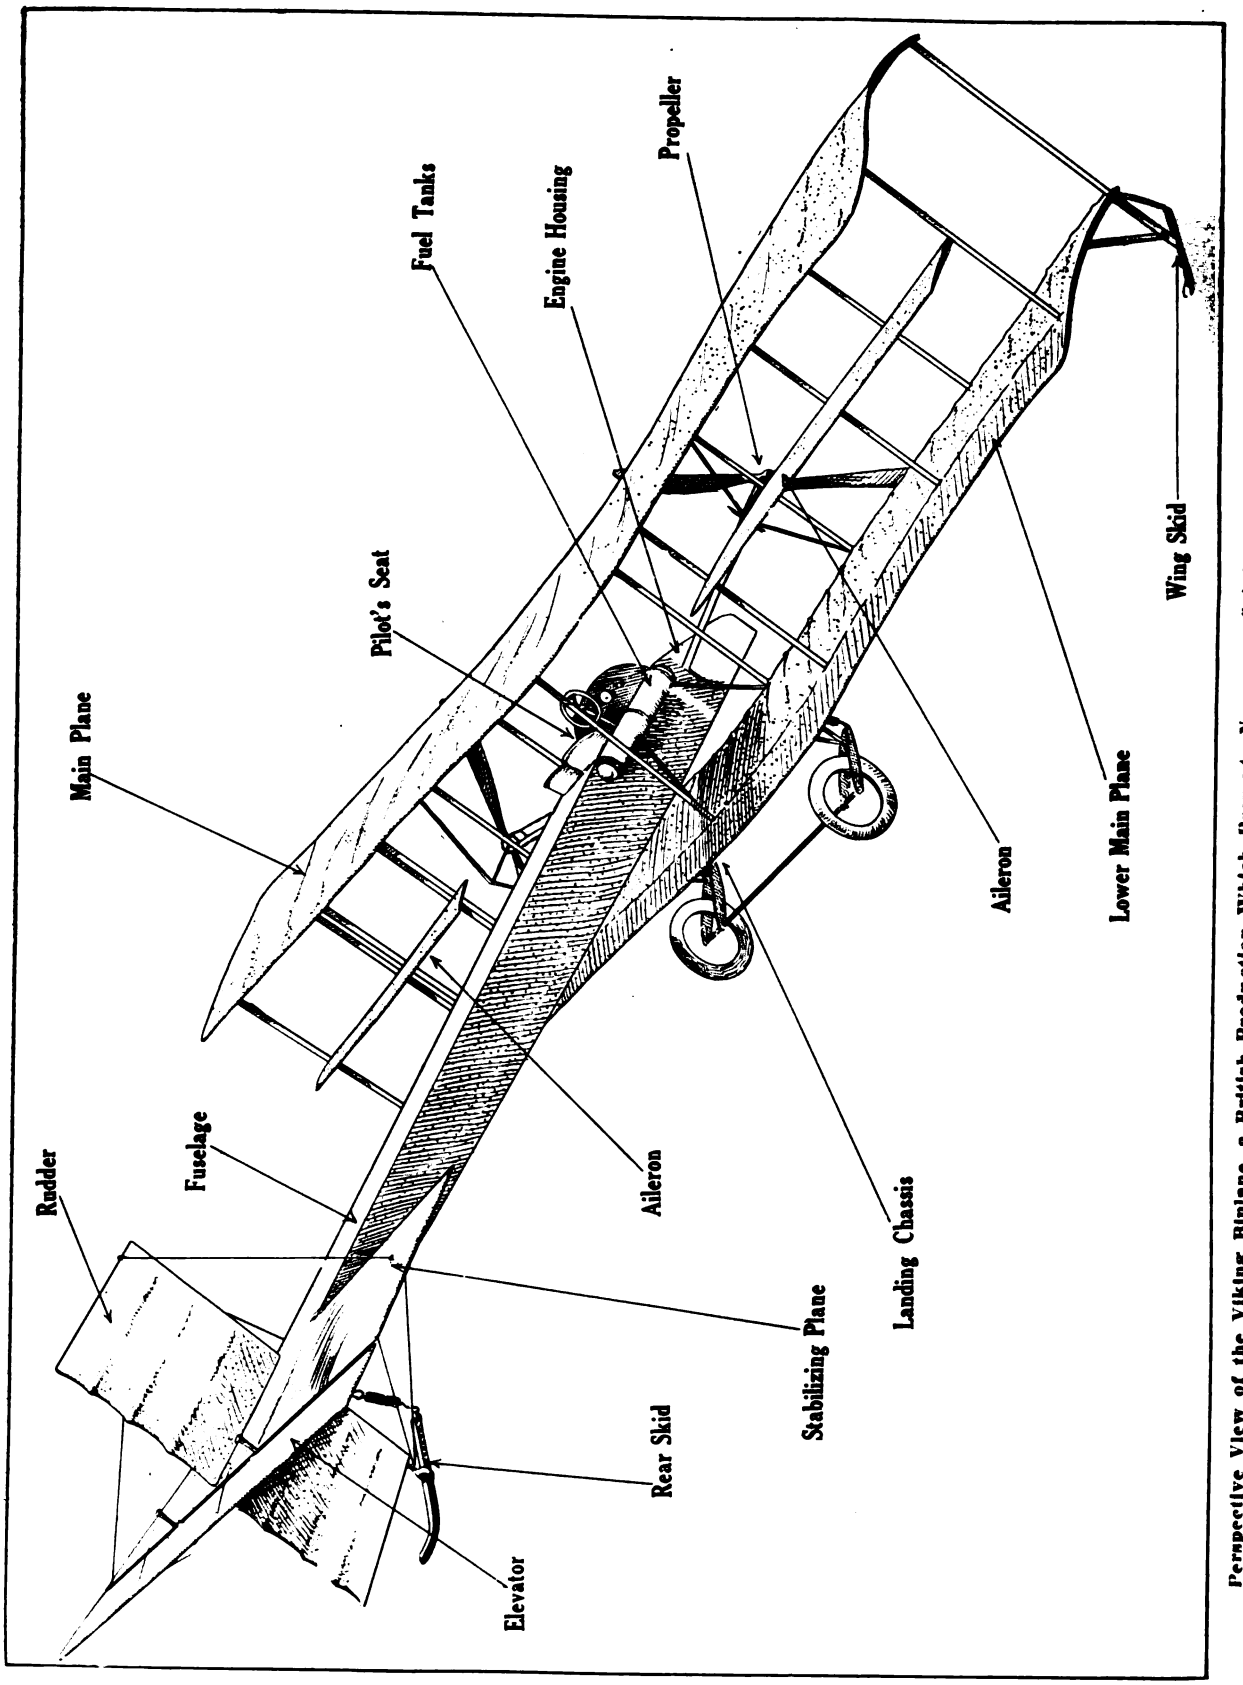


PREMIER CAR FOR REPORTERS.

The reporters of the Indianapolis News, Indianapolis, Ind., have been congratulating themselves recently on the purchase of a Premier seven-passenger touring car, which has been placed at the disposal of the editorial department. It is stated that the machine has already proved its value in quick emergency runs when it was necessary to get men on the spot in a hurry, and that it has made several scoops possible.

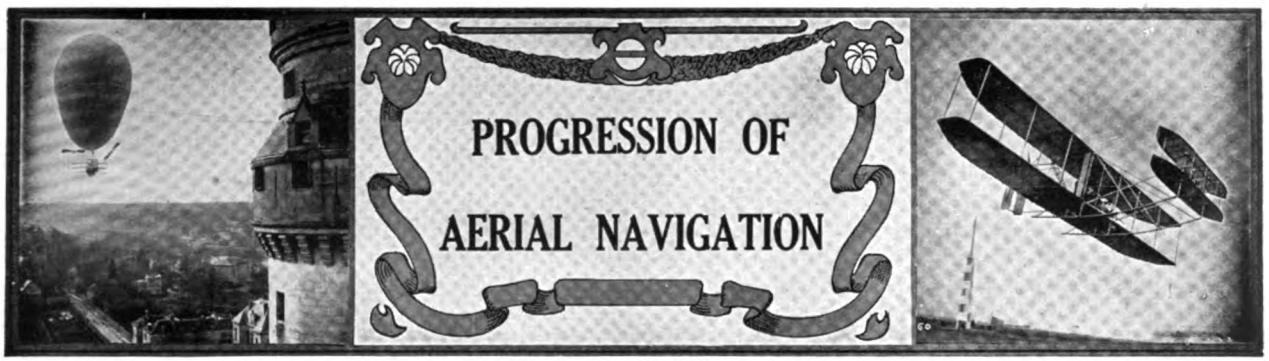
THE CANTON AUTO-JACK.

The jack for garage use must be sturdily constructed, capable of lifting heavy weights and adjustable to the different axle heights of all makes of machines. It may be utilized for elevating the front end of a light runabout or used to raise the rear of a heavy touring car. It should be adjusted easily and quickly to the different heights of axles; its operating mechanism should be simple and fool proof, and it should be capable of being handled by one person.



The Canton Foundry & Machine Company, Canton, O., manufactures what is termed an Auto-Jack which it states has been tested out under all makes of automobiles. It may be lowered to nine inches or elevated to 21.5. The construction is such that one man can raise weights of from 3000 to 4000 pounds. The lifting ratchets are controlled by a pawl, operated by the left hand when grasping the handlebar. The pawl member is easily released and operated, and obviates stooping as with the ordinary jack, thereby saving time and labor. The handlebar is four feet long, which affords good leverage and assists in guiding and propelling the jack with its load.

Auto-Jack Designed for Garage Use.



The supporting antlers and the stem have heavy square threads, these insuring durability. The long antlers will be noted in the accompanying illustration and these are utilized on the rear axle while the shorter members are for service when lifting the front axle. Both are adjustable as to height. When the motor car is elevated upon the jack, either the front or rear may be balanced, permitting the removal of wheels, also the moving of the machine to any desired place by means of the rollers or wheels attached to the jack. The device is constructed of high grade material throughout and is made with either three or four-wheel equipment.

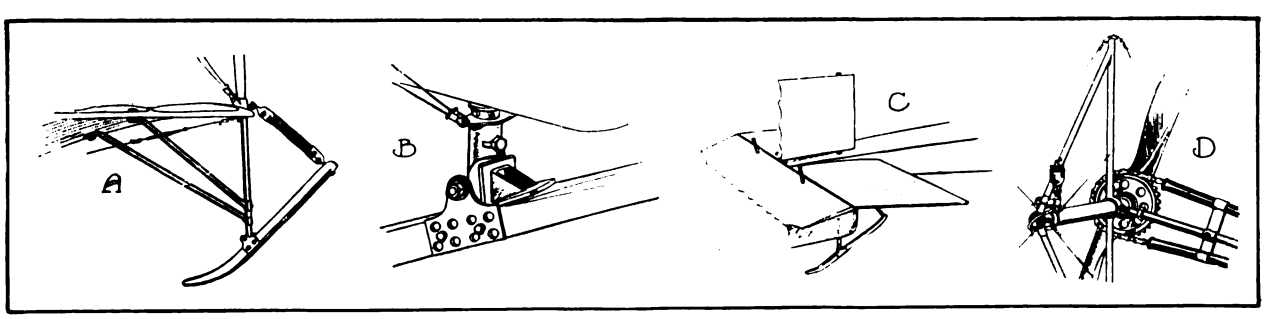
Perspective View of the Viking Biplane, a British Production Which Presents Numerous Original Features of Design and Construction.

Digitized by Google

THE VIKING BIPLANE.

One of the latest machines produced by the Aeronautical Syndicate in England is a biplane bearing the official designation of Viking I. The designer is H. Barber, who has been turning his attention heretofore to the production of monoplanes, some of which have been arranged so as to fly tail foremost. The Viking may be said to be the result of long experimentation and a study of the accompanying sketches will disclose the fact that it presents a number of original features.

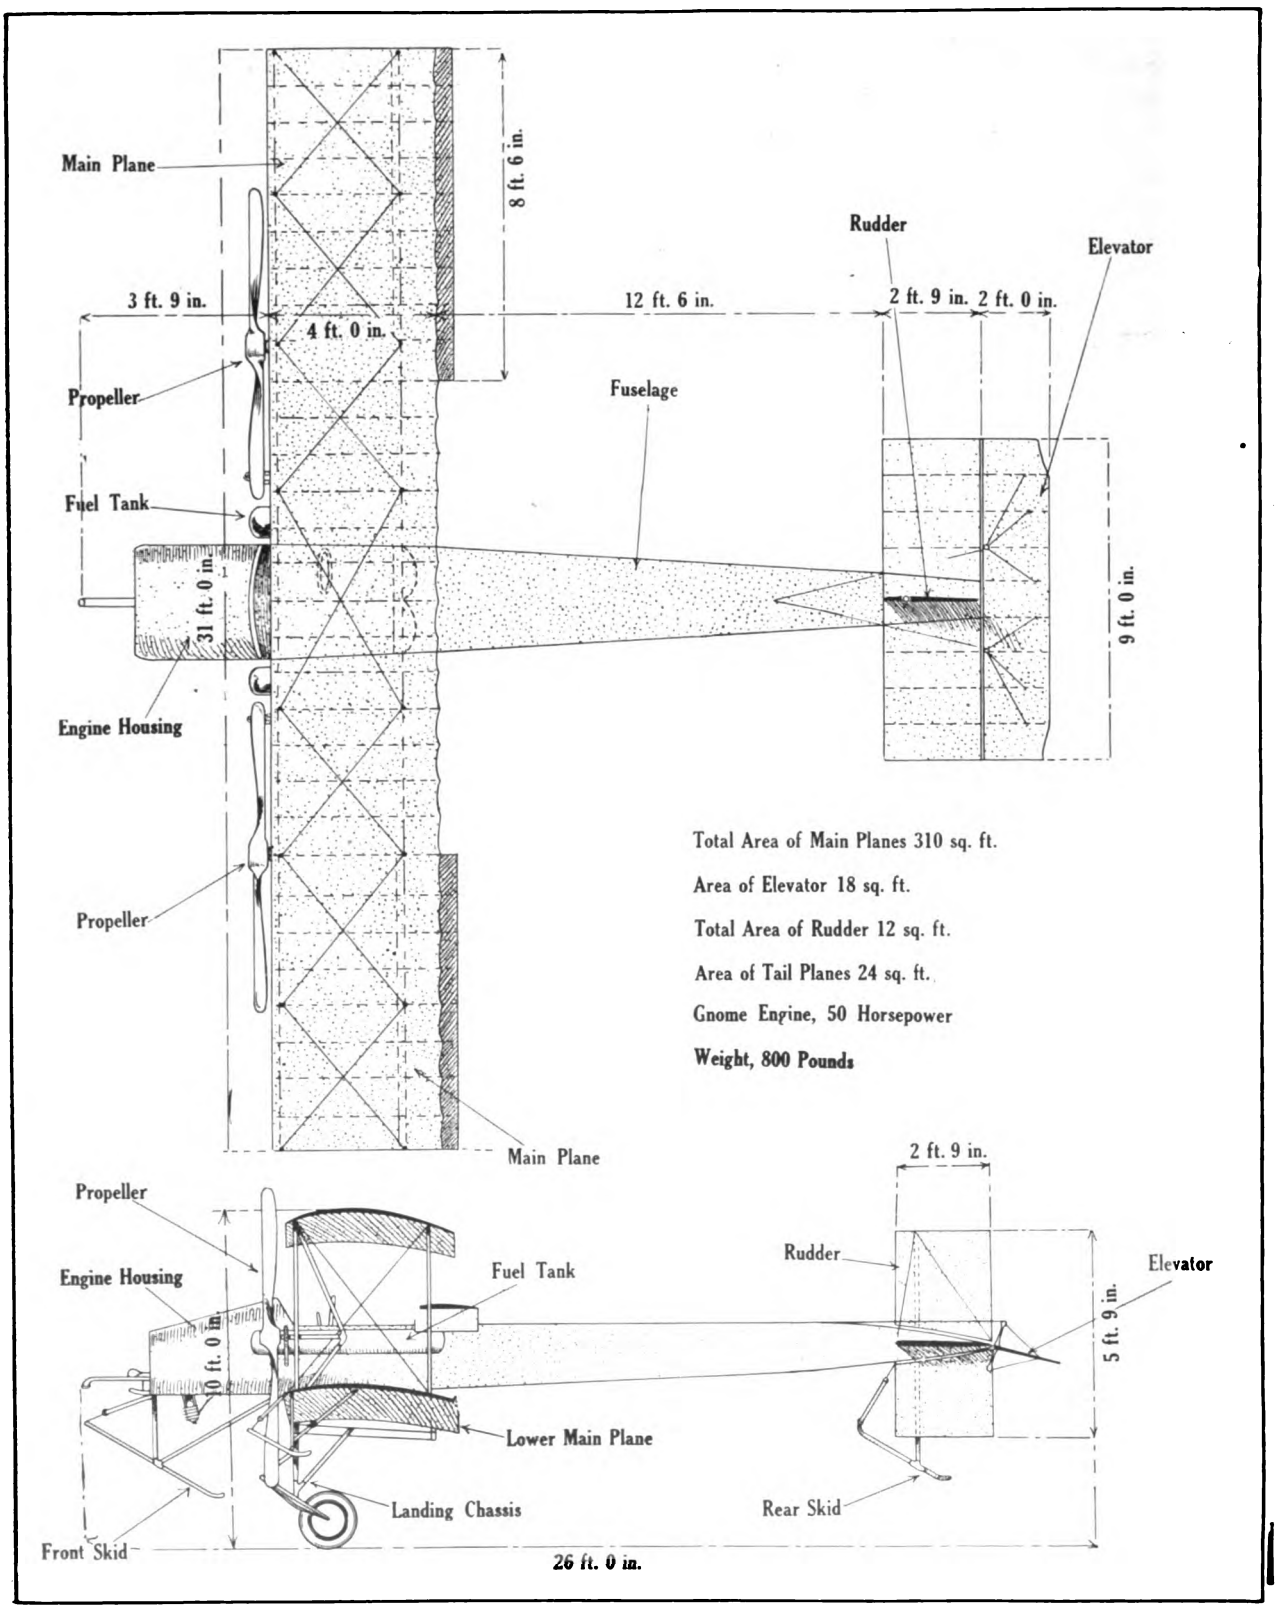
Briefly outlined, the biplane is of the definite fuselage type, completely enclosed, with engine in front, pilot's seat between the main planes and a non-lifting tail. The twin propellers are operated by chains as in the Wright biplane, although they are located in front instead of behind the main planes.



When seen from the front these planes appear to be in three sections, of which the central portion, that forming the main cellule, is horizontal, while those portions forming the wings are given a decided dihedral angle and a slight curvature. The planes themselves are single surfaced, the ribs lying in pockets of the fabric. The span is 31 feet and the chord five feet three inches. The middle section is exactly six feet span, while the two ends are 12 feet six inches.

Both planes are perfectly rigid, except for a slight flexibility at the trailing edge, by virtue of its overhang. These are held in position by a double row of struts, and it may be mentioned here that the propellers are secured by triangular skeletons of steel frame tubing rigidly mounted between the main planes, and braced thereto by steel tension wire. Their centres are separated by a distance of 14 feet.

One of the most interesting features of the entire construction is the method of lateral balance employed. Two ailerons of flexible balances, measuring eight feet six inches by two feet each, are arranged on the rear row of struts, midway between the two decks. These are hinged to the main spar, wires being taken from the trailing spar at the left in the accompanying sketch to the control lever for the purpose of altering their angle of incidence. As this member is pulled downward the spar at the opposite end is also pulled down, but only to one-seventh of the distance. The same action takes place when the member is pulled upward.



The main ribs of these ailerons are made with the usual skeleton formers, between which are arranged laminated strips of Malacca cane, which, when the plane is flexed, slide over one another and provide a species of elastic filling. The upper former is fixed to the main spar, its ends sliding in covered sides or tunnels cut in the trailing spars mentioned. As originally brought out the surface was of aluminum alloy, but the present construction is that of a special surface consisting of fabric sandwiched between two thin plies of wood.

Normally these ailerons have neither angle of incidence nor camber, but when put into action, one aileron is given a positive angle of incidence and a positive camber, while the other has a negative angle of incidence and a negative camber. It will thus be

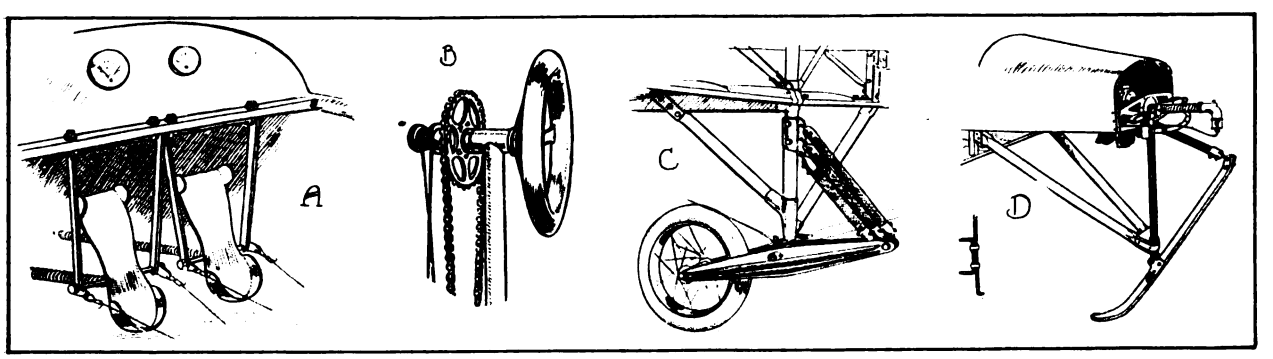
Some Detailed Features of Viking Biplane: A, Wing Tip Skid; B, Tail Skid Joint; C, Empennage; D, Propeller Outrigger.

Digitized by Google

Plan View and Elevation of the Viking Biplane, Showing Detailed Dimensions and Principles of Design.

Digitized by Google

seen that the lateral control does not affect the even distribution of head resistance.



As has been stated the fuselage is entirely enclosed. Beginning at the forward end, a torpedo front of sheet aluminum is arranged over the engine, and this with a slanting screen of the same material behind the motor, protects the pilot and passenger, for this is a two-seated biplane, from any oil or exhaust fumes. The remainder of the surface is of fabric. The fuselage is of the rectangular section, tapering gradually from the pilot's cockpit to the empennage. The construction is of silver spruce except in the region of the engine mounting, where ash is employed to take care of the extra stresses at this point.

The tail is also novel. The elevator flap at the rear is entirely removable by withdrawing a single long wire bolt, and when this has been done each half of the fixed tail plane withdraws from the fuselage in exactly the same manner as the main planes in the ordinary collapsible monoplane. These fixed planes have no angle of incidence, but are cambered top and bottom, so as to have approximately a stream line form. In addition, the pivot rod of the vertical rudder is separated from the vertical rod which supports the small landing skid at this point.

The landing chassis is composed of a pair of wheels united by a wooden axle universally jointed at either end. These are carried on stout steel beams universally jointed to the triangulated upright, which descends from the main cellule. The rear diagonal strut is carried up at a rather sharp angle, to a strong ash filling piece, which forms the end rib of the fixed portion of the lower deck. For up and down motion, the wheel beam rocks on a long tubular bearing, while for swivelling castor wise it is carried on a vertical pin, supported inside the steel lug from which the vertical and diagonal struts spring. Three rubber buffers are arranged one behind the other, with a view to the maximum reduction of head resistance. Separate tracking springs are provided to hold the wheels parallel with the axis of the machine.

In addition to the wheels, there are four skids, one under the tail, one under the extreme forward end of the fuselage supporting the motor housing, and one at each end of the wing tips. All of these are of ash, shod with steel, and each is provided with freedom to swivel in any direction. Particular attention should be paid to the tail skid, which is jointed to a tube that slides over the stub end of the main tail king post, and has a slot in it to allow for the passage of a stud which holds it in position vertically and also provides a stop for its castor motion. The bracket is fitted very carefully so as to prevent any weakening of the tube through the hammer action imposed upon it by the rubber shock absorber.

The upper part of the control lever rocks back and forth to control the elevator, while the action of the ailerons is effected by rotating the hand wheel. This latter carries a chain wheel seven inches in diameter and a small drum one inch in diameter. The wires leading from the chain wheel are applied to the trailing spar of the ailerons, while the cable which passes over the small drum leads to the front spar of this plane. The two thus operate together and provide a simultaneous change in angle of incidence and degree of camber, as previously explained.

Additional Features of Viking Biplane: A, Rudder Control Pedals; B, Chain Wheel and Drum; C, Landing Chassis Construction; D, Motor Housing and Skid.

The rudder control is by a pair of pedals, mounted in hanging stirrups. To operate the rudder, a push forward of the whole foot is required. This naturally makes for very decided comfort on long flights.

The pilot and passenger sit side by side in a comfortable leather upholstered two-seated cockpit, in front of which is the dashboard containing an aneroid, an oil pressure gauge, and a counter indicating the number of revolutions of the motor. Gasoline and oil tanks are placed at each side of this seat.

The motor is a 50 horsepower revolving Gnome. This drives the two propellers by a plain and crossed chain, respectively. The propellers are so arranged that their line of thrust is approximately coincident with the centre of head resistance; which is to say, that it is slightly lower than halfway between the upper and lower planes. Their bearings are carried in the light steel tubular framework, and provision is made for lubricating both the thrust and journal bearings. An accompanying sketch shows the detailed arrangement of their attachment.

MOTORING NEWS OF NATIONAL IMPORT.

National Association Refuses to Sanction Fall Shows---Cincinnati Would Become Industry's Centre---Interest in Transcontinental Touring---Census Figures Concerning Connecticut---Highway Construction Report.

The National Association of Automobile Manufacturers has refused to issue sanctions to Detroit, Chicago and Indianapolis for national motor car shows this fall. Of course this action does not in any way interfere with the promotion of local exhibitions, but such displays hardly would cover the original idea. It is understood that the makers foresaw a run of national shows that would take up time and cost a lot of money.

Detroit was planning to hold its show either in a temporary structure or in a permanent building to be erected for such purposes year after year. Chicago wanted to use the Coliseum, and failing in this, proposed an open air display in Grant Park, on the lake front. Indianapolis sought to hold its exhibition on the speedway grounds.

It is possible that each of these events will yet be held, but without the distinction of being recognized as national affairs. It is pointed out that the Boston show, always conceded the best business display of the year, has never had official sanction from the N. A. A. M. Promoters in the three cities of the Middle West see no reason why their shows should not prove of equal importance to the industry.

The whole point seems to hinge upon the question of date, the dealers in Detroit, Chicago and Indianapolis being convinced that the fall is the best time of year in which to stimulate business by calling attention to the models for the forthcoming season. Manager Chester I. Campbell of the Boston Automobile Dealers' Association has seen fit to express himself in this connection, maintaining that the experience of the Boston show has been such as to indicate that it is held at the very best time of all; namely, just before the opening of the active motoring season.

CINCINNATI AS MOTOR CENTRE.

Local Business Men Take Steps to Interest Manufacturers in City's Advantages.

The Commercial Association of Cincinnati, O., has started an aggressive campaign to interest automobile manufacturing concerns in locating in that city, with a view ultimately to make this the producing centre of the industry. Its members point out that there is no good reason why Detroit should house plants creating 75 per cent. of all the gasoline cars made in this country. Cincinnati is held by this association to be eminently better situated in every way to supply the market with cars.

It will be remembered that at one time Cincinnati was the leading carriage centre in the country. Apparently, its business men feel that it should have taken the same place when the motor car came into vogue. Members of the association have expressed themselves as convinced that they were a little slow in taking a chance with a new device and in responding to the risks involved. While they remained content with the production of carriages, other cities were experimenting with automobiles. Secretary Carl Dahoney says:

"If we can induce just one of the eminent motor car makers to locate here and enjoy the benefits we can offer, it seems to me a short time only will elapse until other producers follow suit. The Commercial Association has all the machinery needed to set in motion a plan of invitation. Let the civic spirit of the community assert itself and press us on to the mark. We will do the rest, and do it effectively."

TRANSCONTINENTAL TOURING.

American Automobile Association Estimates More Than a Million Will Be Expended.

The increasing interest in transcontinental touring has given rise to some careful estimates by the touring information bureau of the American Automobile Association, which has abundant means of determining the number of people who are expected to take these trips during the coming season. Its figures show that at least $1,000,000 will be expended in this manner during 1912. This is based upon the premises that no less than 500 cars will traverse the "Sunset Trail," according to its advance information each car carrying on an average of four persons. Past experiences indicate that this will mean the following expenditures:

Gasoline, $55,000; oil, $15,000; tires, $180,000; garage, $15,000; equipment for car, $25,000; equipment for passengers, $60,000; hotel bills, $320,000; incidentals, purchase of souvenirs, etc., $30,000; return railroad fares, $250,000; return freight on cars, $75,000; total, $1,025,000.

These figures, as large as they may seem at first thought, are decidedly conservative when viewed in connection with the report of Dr. F. L. Bartlett, good roads director of the Denver Chamber of Commerce,

Digitized by Google

who claims that 6000 automobiles visited that state in 1911, leaving behind them no less than $2,700,000.

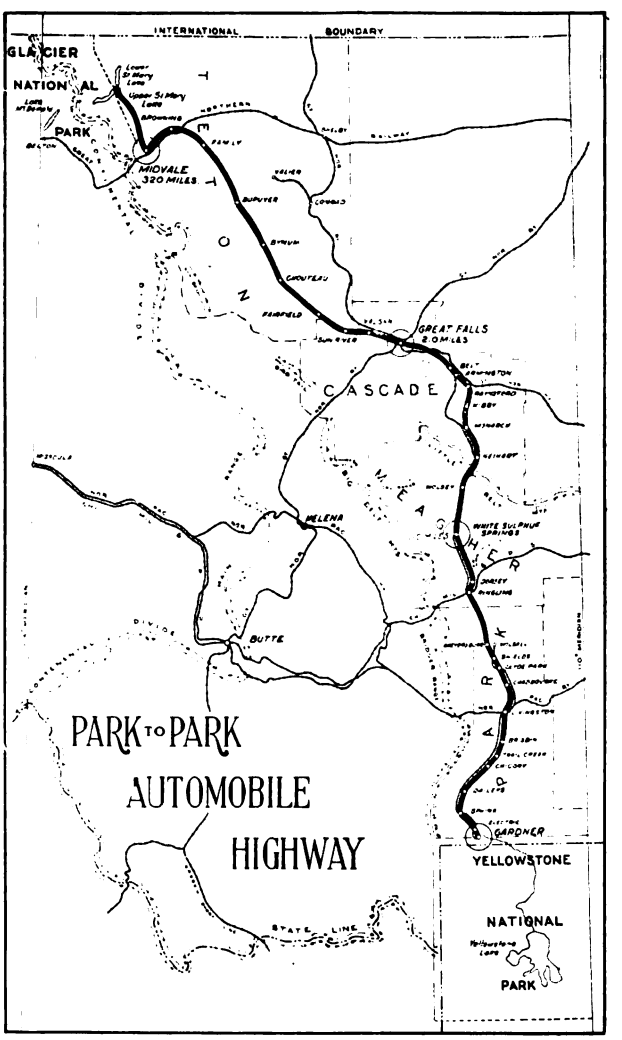
In the growth of transcontinental touring, it is quite common for California motorists to be seen in New England, and many New Englanders are making the journey to the coast. Some make the trip in both directions by automobiles, but a majority return to their homes by railroad. It is estimated that for every dollar expended in good roads, at least $20 is returned to the state, either directly or indirectly.

STRIKE OF PARTS MAKERS.

Action of Molders in Eleven Factories May Seriously Affect the Industry.

Molders in 11 factories of the Aluminum Castings Company, with headquarters in Cleveland, O., and plants in Cleveland, Buffalo and Syracuse, N. Y.; Fairfield, Conn.; New Kensington, Penn.; Manitowoc, Wis., and Detroit, have gone out on strike. Automobile manufacturers throughout the country are more or less interested, inasmuch as there is a possibility that serious results may obtain if the strike is prolonged a sufficient length of time to interfere with the production of cars during the rush period.

The Aluminum Castings Company produces a large number of parts that go into the construction of automobiles. Its products are very important, and its 11 factories supply a large portion of the makers in the industry. A long continued strike would affect seriously the business of nearly every motor car concern of prominence.



NEW SCENIC HIGHWAY.

Private and Public Enterprise Unite in Making Montana Attractive to Motorists.

As a concrete instance of the way in which the people of the West are encouraging automobile tourists, may be cited the new highway which is to connect Yellowstone and Glacier national parks in Wyoming and Montana. Part of this work has been completed, and it is of particular interest to note that Louis W. Hill, president of the Great Northern Railway, is to construct at his own expense, about $50,000, an extension of the original layout through 40 miles of Glacier park to the Two Medicine and St. Mary's lakes. An accompanying map gives an excellent idea of the section and the work contemplated.

This will make a splendid, scenic, automobile roadway from Gardiner, the northern gateway of Yellowstone park, up through the State of Montana to Great Falls, and thence along the eastern slope of the Continental Divide to Midvale, the eastern slope gateway to Glacier park, a distance of 360 miles, not including the extension mentioned above. The state is doing much of the work, but it is expected that the United States government will be asked to help.

Last fall, the first highway connecting these two parks was opened. It follows the old Lewis & Clark trail over the Rocky mountains to Missoula, thence along the western slope of the Divide, up through the Flathead country to Malispell and finally to Belton, the western slope gateway to Glacier park. Mr. Hill, piloting a party of motorists, officially opened the last 250 miles of this roadway as an extension run to the Twin City-Helena automobile tour.

Map of Highway Connecting National Parks in Montana.

The party abandoned the automobiles at Belton and crossed back over the Divide on cayuses, going over the picturesque trails through Glacier park. It is through this section that he will soon begin the work of hewing an automobile highway amid the fir timber of this magnificent park. If it is possible to obtain permission from the government to open Yellowstone park in the same manner, motorists will find this one of the most delightful touring places in the world. In any event the generosity of Mr. Hill will

Digitized by Google

place the beauties of Glacier park within easy reach of every automobile owner.

OSWEGO'S FIRST SHOW.

Splendid Display of Cars and Accessories Interests Citizens of Central New York.

Mayor David D. Long of Oswego, N. Y., pressed the button which turned on the myriads of electric lights in the state armory, April 10, for the first show of the Oswego Automobile club, which closed April 13. It was a splendid display of the season's models, and some of the features were decidedly new, particularly that of society night, when the festivities concluded with a programme of dancing.

The event was under the management of W. R. Marshall, assisted by the following committee of the club: P. B. Keating, James Dunlap and N. L. Bates. In the hallway approaching the main drill shed an arbor of lattice work and southern smilax greeted the visitor. Inside, the entire ceiling was hidden by 10,000 yards of bunting, the prevailing color scheme being white and gold. More than 2000 lights helped to display the merits of the respective cars and accessories on exhibition.

Cars were shown by: Chase Motor Truck Company, Chase truck; J. I. Case Threshing Machine Company, Case; F. P. Anderson, Alco, Hupmobile; Keating Garage & Engine Company, Buick, Chalmers; James Auto Company, Hudson, Havers; H. R. Franklin, Reo; Overland-Syracuse Company, Overland; S. C. B. Garage, Ford, Cadillac; S. G. Dutcher, Elmore; Hazard & Ryan, Michigan; A. A. Ledermann, Pierce-Arrow; H. D. Pierce, Regal; F. D. Van Wagenen, Maxwell, E-M-F, Flanders; T. A. Young, R-C-H; J. C. Miller, Mitchell; National Motor Sales Company, National.

Other exhibitors were: Syracuse Rubber Company, accessories; Standard Oil Company, Polarine oils; M. W. Carlton, Harley-Davidson motorcycles; Baker Electric Company, lamps; M. T. Crimmins, Indian motorcycles; O-Tak-A Tire Remover Company, tire tools; J. H. Valentine Company, Hanna self-starter; S. F. Heydenfelt, Curtiss and Bleriot aeroplanes.

PRODUCTION IN CONNECTICUT.

Census Bulletin Discloses Remarkable Increase in Business During Last Five Years.

The bulletin concerning manufactures in Connecticut, as revealed in the 13th census, will prove interesting reading to those engaged in the automobile industry. This shows eight establishments reporting the manufacture of automobiles and 20, with about one-quarter of the total value of products for the whole industry, engaged in producing automobile bodies and parts as the most important product. A marked increase is shown in value of products and in value added by manufacture from 1904 to 1909.

With these 28 concerns, the average number of workmen employed in 1910 was 3815. The value of products for the year was $11,668,000, and the value added by manufacture, $6,812,000. This shows a percentage of increase in value of products of 341.3 and in value added by manufacture of 360.

The cities showing a gain in value of products in 1909 as compared with 1904, due in a measure to the automobile industry were: Bridgeport with 47.1 per cent.; New Haven, 28.8; Hartford, 56.6, and New Britain, 34.2.

A comparison of the automobile industry for the state, as between 1904 and 1909, shows that there were manufactured in the former year 386 gasoline and 319 electric cars, and in the latter, 2913 of both types, these not being separated in the report for 1909. Steam vehicles to the number of 127 were produced in 1904, but this appears to have become a lost art in 1909. The average value a machine in 1909 was $2564 as against $2354 five years previous. The report concludes:

"Although the electric machine was the type first produced in Connecticut, practically all machines built in the state in 1909 were of the gasoline type. A detailed statement by classes of the automobiles manufactured is not presented, because to do so would disclose the operations of the individual establishments. Touring cars rank first in number, runabouts second, and closed pleasure and family vehicles third. Cabs, patrol wagons and ambulances rank in the order named. Nearly all the machines were equipped with engines of from 30 to 50 horsepower, although a few pleasure and family vehicles exceeded that rating and a limited number fell below it."

DISCUSS SPEED REGULATION.

Conference of Motorists and Law Makers Seek Plan to Reduce Possibility of Accident.

A conference for the purpose of arriving at some definite plan with regard to the regulation of automobile speed in New York City was held in the City Club, 55 West 44th street, April 16, at which the following were present: Chief Magistrate William G. McAdoo, Ralph Folks, leader of the majority in the board of aldermen; Frank L. Dowling, minority leader; Otto C. Gelbe, chairman of the aldermanic committee on police; Police Commissioner Waldo, President Conde Nast, Secretary Frederick H. Elliott and Joseph Tracy of the Touring Club of America, M. J. Budlong and John F. Plummer of the Automobile Dealers' Association, President H. F. Donaldson and General Manager Coker F. Clarkson of the Society of Automobile Engineers, Foster Gilroy and C. R. McMillen, representing other interests.

Digitized by Google

Various methods have been suggested for reducing the number of accidents which have been the subject of much comment in the metropolis of late. It is admitted on all sides that the average motorist is not to blame, but the question is one rather of attempting to reach the reckless operator or owner who has given abundant evidence of his lack of respect for the rights of others. The board of aldermen has before it an ordinance seeking to fix a speed limit which shall be both reasonable and safe.

Naturally, this has brought up the whole matter of speed limitation and there is a wide difference of opinion as to whether it would be best to fix a limit of say 15 or 20 miles an hour. The chief magistrate laid before the conference the conflict in ideas now existing among the various magistrates under the "reasonable and proper" regulation of automobiles. it is hoped that some scheme may be devised whereby there will be uniform ruling upon the subject.

Among the suggestions offered is that of amending the city charter so as to give the police power to issue and revoke licenses for driving, this applying to the owner as well as the professional chauffeur. It is expected that in this manner it will prove an easy matter to reach the reckless operator.

IMPROVED ROAD STATISTICS.

National Board Gives Some Decidedly Interesting Figures Concerning Highway Work.

According to the figures submitted in the report of the office of public roads, Department of Agriculture, the total public highways in the United States at the close of 1909, the latest date for which information is available, was 2,199,695.14, which exceeds the mileage in 1904 by 48,266.14. Of this total, 109,476.32 miles were improved, 102,870.44 miles being surfaced with gravel, 59,237.35 with stone and 28,372.52 with other materials.

As a great deal of good roads work has been accomplished during the past two years, it is probable that these figures will have changed materially by the time the next report is made. However, some facts stand out very prominently in this statement.

Indiana led all other states in the total mileage of improved roads with 24,955.75 miles. Ohio remained in second place with 24,106 miles. New York was third with 12,787.36, Wisconsin fourth with 10,167.33, Kentucky fifth with 10,114.95, Illinois sixth with 8914, California seventh with 8587.75, and Massachusetts eighth with 8463.18. The greatest progress in road improvement was made in New York.

The table below gives the mileage statistics for all of the states, in order of their percentage of improved roads. It will be seen that Massachusetts has yielded first place to Rhode Island, which was second in 1904. Indiana remains in third place and Ohio in fourth. The position of the other states has changed very materially:

State	Total Mileage 1904	Total Mileage 1909	Per Cent. Improved 1904	Per Cent. Improved 1909
Rhode Island	2,361	2,120	43.27	49.14
Massachusetts	17,092	17,272	45.89	49.00
Indiana	68,306	67,996	34.96	36.70
Ohio	69,439	88,861	33.79	27.13
Connecticut	14,088	12,583	16.75	24.08
New Jersey	14,842	14,842	16.32	22.76
Kentucky	57,137	53,744	16.60	18.82
Vermont	14,521	14,406	13.45	18.40
California	46,653	48,069	18.87	17.87
Wisconsin	63,593	61,090	16.72	16.64
New York	73,798	79,279	7.96	16.13
Washington	31,998	34,283	6.17	13.19
Maryland	16,773	16,773	9.36	12.77
Utah	7,090	8,320	8.57	12.23
Tennessee	48,989	45,913	8.75	11.66
South Carolina	41,830	32,075	4.49	11.02
Maine	25,528	25,528	9.10	10.59
Michigan	69,296	68,906	10.14	10.01
Florida	17,374	17,579	5.10	9.97
New Hampshire	15,116	15,116	8.55	9.58
Oregon	34,258	29,475	7.56	9.49
Illinois	94,141	94,141	8.42	9.47
Georgia	57,203	82,230	2.86	7.27
Minnesota	79,324	79,322	7.87	6.83
Alabama	50,089	49,639	3.43	6.58
Delaware	3,000	3,000	2.20	6.22
North Carolina	49,763	48,285	2.53	4.79
Arizona	5,987	5,987	3.62	4.56
Missouri	108,133	107,923	2.53	4.40
Virginia	51,812	43,399	3.09	4.38
Wyoming	10,447	10,569	1.46	3.94
Pennsylvania	99,777	87,386	2.17	3.84

NEW TIRE PRICES.

Figures Show Substantial Reduction Put in Force by Some of the Leading Manufacturers.

The new prices which went into effect with many of the leading tire manufacturers of the country early in the month vary decidedly, but in no case it is understood the cut will be less than 10 per cent. The old prices were as follows: Size, 32 by 3.5 inches, $24.40; 34 by four, $37.75; 36 by four, $40.25; 36 by 4.5, $50.75; 36 by five, $62.30. Two firms have arranged a new scale as follows: Size, 32 by 3.5, $21.20 and $21.70, respectively; 34 by four, $31.30 and $33.60; 36 by four, $33.35 and $35.80; 36 by 4.5, $42.05 and $45.20; 36 by five, $51.65 and $55.50. Others have announced a straight reduction of 10 per cent. and still others have not made public the new schedule, but promise it in the very near future.

GROWTH OF THE ACCESSORY INDUSTRIES.

Demand for European Equipment for Motor Vehicles as Exemplified by Marburg Brothers, Importer and Sales Agent for Mea Magnetos, Lodge Spark Plugs, S. R. O. Ball Bearings and Marburg-Hagen Springs.

NO DEMONSTRATION of the wonderful industrial progress of the world has been as complete as that made by the adoption of the automobile. The

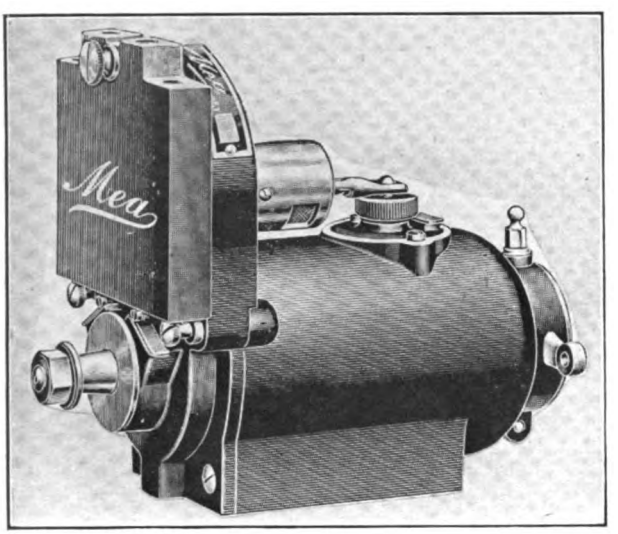

Fig. 1—The Mea Magneto, Type A 4.

endeavors to perfect the mechanical conveyance have brought developments that are seemingly commonplace enough to those who engaged in or observed the work. This applies to industry and engineering. The periods of transition have been marvellous when measured by the standard of weeks and months. Gigantic enterprises and mammoth factories have been created and without in any material degree satiating the demand. It is possible to point to hundreds of instances where enterprises have been developed to large proportions from an initial business based entirely on the merit of a single product, sold in a market in which the competition has been particularly keen.

An illustration in point is the business of Marburg Brothers, engineers and importers, a firm that but little more than two years ago established itself in an office having floor area of 240 square feet in the automobile district of New York City. The company now occupies a double suite of offices in the same building with nearly 3000 square feet of floor space, which has been found inadequate, and it has arranged to locate in an office suite in the new United States Rubber Company's building, at Broadway and 58th street, June 1, where an area of 4000 square feet of floor space will be occupied.

But this does not represent the true growth, for during the past year offices have been established in Chicago and Detroit because of the demand from the trade for personal attention, and the firm has been increased by the admission of a third brother.

Undoubtedly a large measure of the success in this case has been due to the business methods of the firm, which were adopted after careful study of the demands of the market and the merits of the lines available, and arrangements were made for handling exclusively some of the standard products manufactured by leading European firms.

Of these probably the best known is the Mea magneto, made by the Mea Works, Stuttgart, Germany, it being claimed for this instrument that its design and construction insures a better spark at all positions of advance and retard than can be obtained with the horseshoe type magnetos, even with heavier magnets.

A second line is the S. R. O. ball bearings, made by the Schmid-Roost Company at Oerlikon, Switzerland. The factory where the S. R. O. bearings are produced is the oldest in Europe, which means the oldest in the

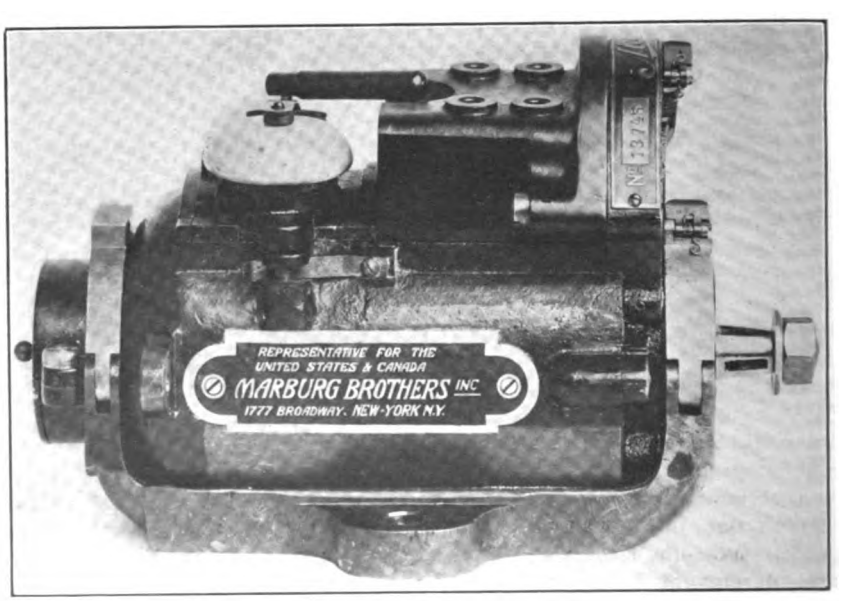

Fig. 2—The Mea Magneto, Type B H 4.

Digitized by Google

world, and these bearings are famous for the workmanship and the high grade material.

The third product is the Lodge double-pole spark

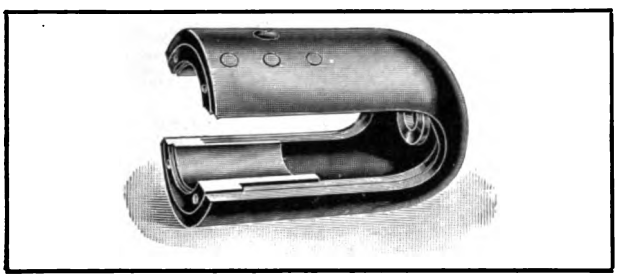

Fig. 3—The Bell Shaped Magnet of the Mea Magneto.

plugs, made by Lodge Brothers, Birmingham, England, a leading firm of English automobile engineers, a description of which, with the benefits derived from two point ignition, is given later.

The fourth is the Marburg-Hagen springs, produced at Hagen, Germany, where spring making has been the chief industry for generations. The qualities of these springs are amply proven by the European automobile manufacturers who use them.

The demands of the motor vehicle industry have been considered by the firm in its activities, although of course the S. R. O. bearings are just as suitable as any others of standard makes for all manufactures, and the springs can be made to suit any design submitted by vehicle manufacturers, whether motor driven or not. It is an acknowledged fact that the Mea magneto, besides its recognition in the American automobile world, has attained an enviable position in the aeronautic field, and in the motor boat industry it is very widely known.

The Mea Magneto.

For energizing the explosion engine the magneto has been generally adopted by designers, engineers and builders, because of the elimination of many elements of uncertainty obtaining with the use of the battery and the possibilities for simplifying construction. Regarded as more reliable, and having especial endurance, the magneto is necessary unless a cheaper installation is made through economy. Magnetos are numerous in types and constructions, although there are really two classes, in which the varied forms may be grouped: viz., low-tension magnetos and high-tension magnetos. There are two types of low-tension magnetos, the first used in connection with a step-up coil, furnishing a jump spark, and the other used in connection with the make and break system. The strictly high-tension magneto furnishes a jump spark. Further distinctions and divisions can be specified as the armature and inductor divisions. The armature division may be sub-divided into the primary and the compound armature types, and the latter into low and high-tension forms.

All magnetos are made with permanent magnets and the current present in these magnets flows from the positive to the negative poles. The stronger the magnetic influence the more efficient the instrument. The "cutting" or breaking of the current of magnetism creates an interval or interruption that, if the current is induced to flow through a circuit in which there is an air gap (which in the ignition circuit of an explosion engine is between the electrodes of the spark plug) will arc or "jump" and cause a spark of varying intensity. The current as it is generated by a magneto is seldom of proportions to be noticeable until it has been intensified. This is accomplished by the use of a rotating member between stationary windings, or windings rotating between the poles of the magnets.

With the armature types of instruments that which has an armature composed of the core of soft iron wire, wound with a number of layers of smaller wire, each winding being separated by insulation, is known as the primary form. The current generated by it must be increased in potential and so it is carried to the transformer coil, composed of a considerable number of layers of smaller wire carefully insulated, and it is then directed through a distributor to the engine in a satisfactory manner. The primary armature magneto is always low tension.

The compound form may be practically the same in general appearance, but the armature is composed of the core and the primary and secondary windings, and the current may be sent out direct without the use of the coil, this being replaced by the second winding on the armature.

The inductor types may be similarly low and high tension. The form differs with the armature instruments in that the rotor is caused to revolve between the stationary windings. If the windings be the core and the first, or primary, winding only, it is necessary to employ a transformer coil to properly intensify the current, but if the windings are both primary and secondary the current may be used direct and the instrument is high tension. With the high-tension magneto the vibrator coil and the timer are eliminated, the distributor supplying the place of both.

So far as low-tension magnetos may be used they may be likened to the ordinary dry cell generator or liquid accumulator (both being termed batteries) in that the energy available, to be useful, must be intensified. The low-tension magneto is merely a source of current in which the energy is generated as the instrument is driven.

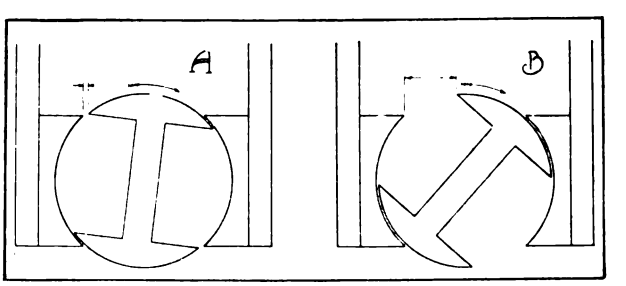

Fig. 4—Relative Position of Mea Magneto Magnets and Armature at Spark Production: A, Advanced; B, Retarded.

Digitized by Google

The facts summarized will differentiate each form or class of magneto sufficiently to permit description of the high-tension types of Mea magnetos, imported

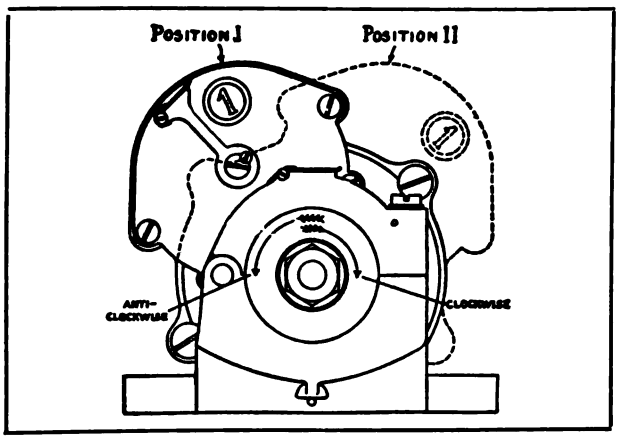

Fig. 5—Spark Advance with Mea Magneto. Advanced at Position 1 with Clockwise Instruments, Retarded at Position 2. Drawing Shows Driven End of Magneto.

by Marburg Brothers. In all there are 22 different machines, adapted for use with one, two, three, four, six or eight-cylinder motors, and these are small, medium, large or very large, as the proportions of the engines demand. To illustrate: There are three sizes of single-cylinder magnetos, three of two-cylinder, two of three-cylinder, four of four-cylinder, three of six-cylinder and one of eight. Obviously all of these differ, but so far as principle of design is concerned they do not vary to any appreciable extent.

The Mea magneto differs with all other instruments in that its construction permits the simultaneous movement of the magnets and the breaker, instead of the movement of the breaker only, as is the conventional practise. The value of this quality necessitates an explanation in brief relative to high-tension magnetos. Taking the armature type with the winding connected in series, the low tension or primary winding is ordinarily short circuited by a breaker that opens at certain points each revolution, generating a high voltage in the secondary or high-tension winding at the instant of the break in the current and causing a spark at the gap between the electrodes. The quality of the spark, its heat value to be precise, is dependent largely upon the position of the armature with reference to the magnetic field, or the relation of the armature and the field, when the spark is created.

With the high-tension magneto the correct relation or position is established twice each revolution, or at intervals of 180 degrees, and two sparks may be obtained each time the armature has revolved once. The production or timing of the spark is by opening the breaker earlier or later, and if the magnetic field (the magnets) cannot be moved the relation between the armature and the field must be changed if the spark be advanced or retarded.

The design of the Mea magneto mechanically insures a uniformity of spark in all positions of timing, as the breaker is attached to the magnet and is advanced and retarded simultaneously with it, thus establishing retarded positions between the magnet and the armature field that cannot vary. The value of this quality is shown in diagram at Fig. 4. The range of timing of the Mea magneto is from 45 to 70 degrees, depending upon the size and type of the instrument. However, the timing range can be increased to any number of degrees desired. In other words the relations are not changed and there should be the same value of spark at all times. The value of the equally hot spark in all positions of timing is well understood. The magneto can be put in full retard and the engine started easily if there is an explosive mixture in the cylinders. As the requirements for driving slowly with a heavy load are the same as those of starting, the same benefits are obtainable under these conditions. The loss of possible high speed need not be feared, as the Mea spark is of the same intensity in the maximum advance of the magneto, and its range of timing is ample to reach the limits of any motor.

In contrasting this value it is maintained by the maker of the Mea instruments that the only time the retarded spark is desired is when the engine is running slowly or the car is moving slow, and that it should be just as reliable as at any other time of operation. The feature of the Mea magneto is a bell shaped magnet that is placed in the axis of the armature, a distinct contrast with the horseshoe type of magnet, which is installed at right angles to the armature. The magnets are claimed to have great magnetic permanency because of the form, which is a factor of material importance. The magnetos, it is maintained, will produce a spark of constant intensity, assuming constant speed, independent of the timing.

The following description of the four-cylinder magneto will be of interest: Referring to Fig. 8 it will be noted that the bell shaped magnet 100, with the poles in a horizontal line near the driven end of

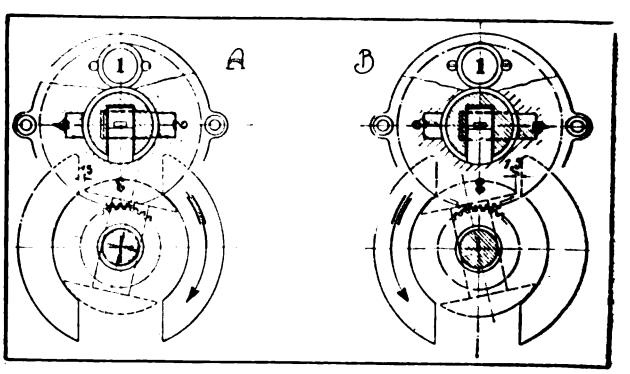

Fig. 6—Position of Armature and Distributor at Firing Point: A, Clockwise Magneto; B, Anti-Clockwise Magneto.

the magneto, partly encloses the armature 1. This armature is mounted in the ball bearings 17 and 18. The armature consists of a spindle or shaft carrying an

Digitized by Google

I shaped iron core, which is wound with a heavy primary winding of a few turns of wire and a light secondary winding of many turns of wire. This arma-

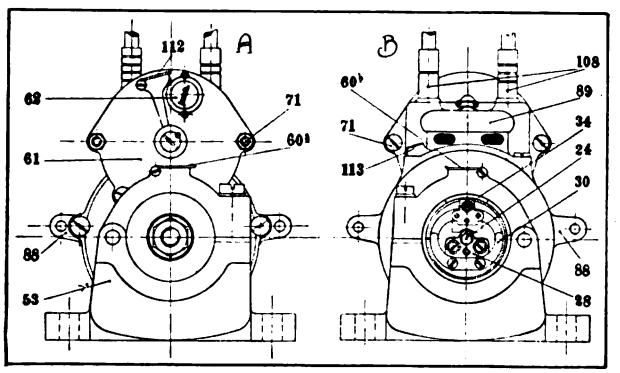

Fig. 7—Mea Magneto, Types B and C: A, Front, or Driven End; B, Rear or Breaker End.

ture shaft also carries the condenser 12, the collector ring 4, and the low-tension circuit breaker 26-39. The circuit breaker is composed of the disc 27 which carries the short platinum contact 33, and the insulated plate 28 which holds the spring 30 which supports the other platinum contact point 34. This platinum point is adjustable. The circuit breaker is operated by the fibre roller 31, in connection with the cam disc 40, which is provided with two cams and is located within the breaker. The circuit breaker is parallel to the primary winding outside of the case 96, and is covered with a brass case. In the operation of the circuit breaker the fibre roller 31 presses against the cam disc and lifts the disc supporting the spring and brings the contact points together.

The circuit breaker box is closed by the cover 74, which supports at its centre the carbon holder 47, by which the carbon 46 is pressed against the screw 24. The screw 24 connects at one end with the low-tension winding of the armature and at the other end with the core of the armature. The entire circuit breaker can be removed by the removal of the screw 24. The condenser 12 is in parallel circuit with circuit breaker and is fitted to the right armature cap. This serves to absorb the excess current induced by breaking of primary circuit. The ends of the primary and the secondary windings are metallically connected with armature core consequently with the body of the magneto. The joint of the two wires is connected with the metal piece 4 of the condenser 12, which is insulated from the armature shaft. The secondary wire is connected with a slip ring that is fitted to the vulcanite member 6, which is insulated from the armature shaft. From this slip ring the high-tension current is conducted through the carbon cylinder 77, carried by a holder and insulated from the cover 91, and thence to the distributor 70. A second carbon 78, which is not insulated, slides on the right cap of the shuttle and serves to conduct the current from the armature to the body of the magneto.

The high-tension current is collected from the collector ring 4 by the brush 77, which is carried in the brush holder 76 which is also supported by the removable cover 91, the low-tension grounding brush 78 being carried by this same cover, which relieves the ball bearings of all current that might have a deteriorating effect. The cover 91 also carries the safety gap 89, which protects the armature from excess of voltage should the magneto become disconnected from the spark plugs.

The distributor is attached directly above the armature and it consists of the shell 70, the rotating member 66, which is driven by the steel and bronze gears 7 and 72 from the armature shaft, and the distributor finger 23, the shell and the rotating member being of the best insulating material. Imbedded in the shell are four contact plates which are in metallic contact with the lead terminals at the top of the distributor, into which the ends of the cables connected with the different engine cylinders are inserted and made fast.

The high-tension current is collected from the collector ring 4 by the brush 77 and the brush holder 76 and reaches the distributor from the carbon 77 through the bridge 84 and the carbon 69. It is conducted to the brushes 68, placed at right angles to each other, which make contact alternately with the four contact plates in the distributor shell 70.

In the operation of the instrument the circuit breaker ordinarily short circuits the low-tension winding of the armature and this short circuit is only broken when the breaker opens. When the screw 24 is grounded through the terminal 50 and the low-tension switch to which it is connected, the low-tension

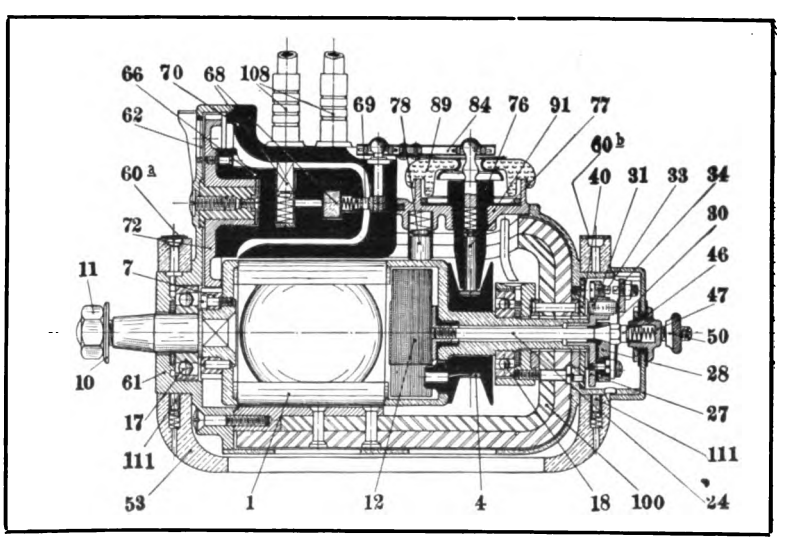

Fig. 8—Section of B H 4 Mea Magneto. Lower Half of Drawing at Right Angle to Upper Half, to Show Pole Piece Construction.

Digitized by Google

winding is permanently short circuited so that the magneto will not create energy.

Any desired variation in timing is accomplished by

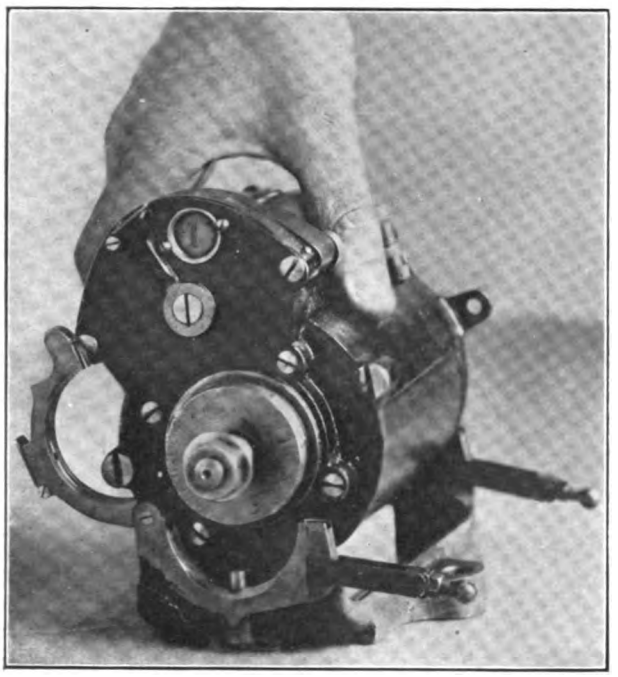

Fig. 9—Mea Frame or Base Unclamped for the Removal of the Magneto, Illustrating the Accessibility of the Instrument.

turning or rocking the bell shaped magnets in the stationary base by means of the lever connections at the side lugs, shown as 88 in Fig. 5. The spark is advanced by turning the magnet in the direction opposite to the rotation of the armature, and it is retarded by turning it in the direction of the rotation of the armature. The range of timing obtained with all medium and large size magnetos for three, four, six and eight-cyclinder motors is about 70 degrees, or very nearly the fifth of the circumference of a circle.

The magneto is mounted in the frame or base 53 so that the entire construction may be turned or revolved partially on its axis. The installation is such that the magneto may be removed from the frame with the greatest ease, by removing the top parts, 60a and 60b, of the bearings. Not only is the weight small but the protection from water, dust and road accumulations is ample. The breaker construction is such that even at the highest speeds the lightness of the parts insures accurate operation, while the centrifugal force has no undue influence upon the circuit breaker because the circuit is broken parallel to the axis.

In Fig. 5 will be noted a circular indicator that is protected by glass through which may be seen the numbers marked on the distributor gear, which correspond to the number of the cylinder the magneto is firing. This has a special value in that it permits the magneto to be positively set after it has been removed from the base, this obviating the trouble of learning the position of the distributor by opening the distributor case. The cables are all marked so as to make replacement a certainty.

The type A magnetos are all small and with these the case is stationary and is designed to be fitted to the engine without a separate base. The timing range of this type is about 45 degrees. With the types B and C the magnetos are turned in the base as has been described. With the single-cylinder magnetos the distributor and distributor gears are not used, the current being taken from the carbon holder 70 direct. The two-cylinder magnetos are similar to the single-cylinder instruments save that the metal part of the slip ring 4 extends only over about 100 degrees and the two collecting carbons are placed at an angle. But one carbon is connected with the high-tension winding at a time and the current is alternately sent to one or the other cylinder.

As summarized the advantages claimed for the Mea magnetos are increased flexibility of the car, safe and easy cranking, greater power, quick acceleration, and that no battery is required for starting. To further emphasize these it is maintained that with a retarded spark the engine may be operated at the slowest speed it will draw a charge of fuel; the necessity of gear changing is reduced; no matter how high a speed the magneto is timed for it may be retarded to a position safe for firing and started on a quarter turn of the crank, that the power is increased with a retarded spark, and in hill climbing for instance driving can be made on the high speed; that quick acceleration is positive because of the certainty of the spark.

Because of the adoption by a considerable number of makers of equipment employing acetylene gas for the initial impulse in starting necessitating the creation of a spark without the use of the starting crank,

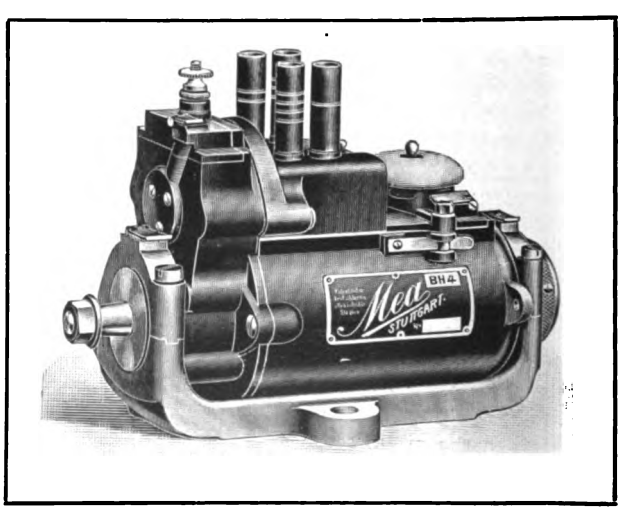

Fig. 10—Mea Magneto, Type B H 4, as Equipped for Dual Ignition.

the Mea dual magneto has been placed on the market. This installation includes a Mea coil switch and a Mea magneto dynamo, which in the main does not dif-

Digitized by Google

fer with the Mea high-tension magneto or independent type, but is provided with a battery breaker. The system of connections differs somewhat with the two

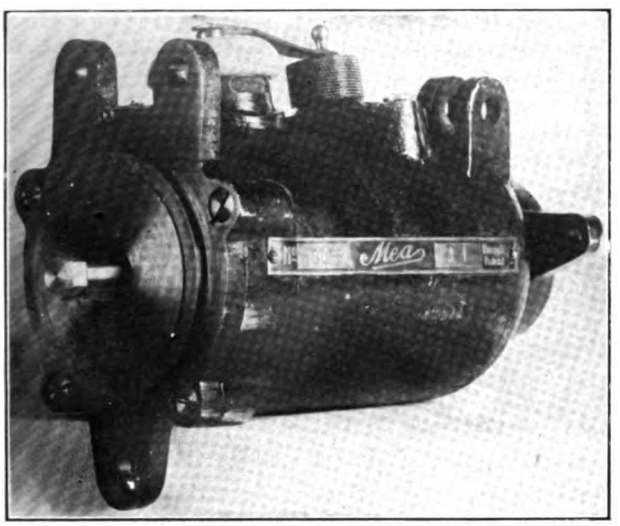

Fig 11—Mea Magneto, Type G1, Built for Use with Gnome Aeroplane Motors.

types described and in these particulars:

The secondary (high-tension) connection includes wiring from the distributor to the spark plugs, which is the same as used with the independent magnetos, a connection from the high-tension switch to the magneto distributor, and from this switch to the high-tension carbon holder. The primary wiring includes a connection from the circuit breaker of the magneto to the switch used for grounding the magneto identical with the wiring used for this purpose with the independent magneto. Other connections unite the battery, coil and the battery breaker of the magneto.

Through these connections the distributor is connected either to the magneto or to the high-tension side of the coil. Whenever the distributor is connected to the coil the low-tension part of the switch grounds the breaker of the magneto and closes the circuit to the battery breaker. When the distributor is connected to the magneto the switch disconnects the battery and opens the battery ground connection. In this manner the distributor will be connected to the magneto armature whenever the magneto fires, and it is connected to the coil whenever the coil is operated. The Mea dual installations are furnished for four and six-cylinder engines, in sizes for medium, large and very large motors.

The standard Mea dual equipment includes a coil of the vibrator type, but if desired single spark coils can be furnished, these affording a single spark for each firing stroke, and fitted with an attachment that will create a very rapid succession of sparks for starting purposes. Both coils are of the horizontal dashboard type that may be easily installed. The magneto dynamos of the two types differ only in the arrangement of the battery breaker. With the vibrator type of coil the breaker closes when the spark is created, while with the single spark form the breaker is normally closed and is opened at the instant of firing. The vibrator coil was adopted with the Mea equipment because of greater simplicity in construction and operation, and the fact that if through oversight the coil remained connected with the battery with the motor stalled it would not heat as would a single spark coil. The only advantage of the single coil—greater motor efficiency—is regarded as of little value with the Mea magneto, because its qualities are such that the battery would seldom be used save for an emergency, when fast work or great power is not so important.

With the type SC Mea coil and switch all terminal posts are placed in the periphery of the coil close to the dashboard, and the vibrator is located at the end of the coil where it may be easily reached for adjusting. The switch has three positions—magneto, battery and off. No push button or special starting device is required. To start the battery from the seat the switch is moved to the battery position and, after starting, changed to the magneto. When cranking

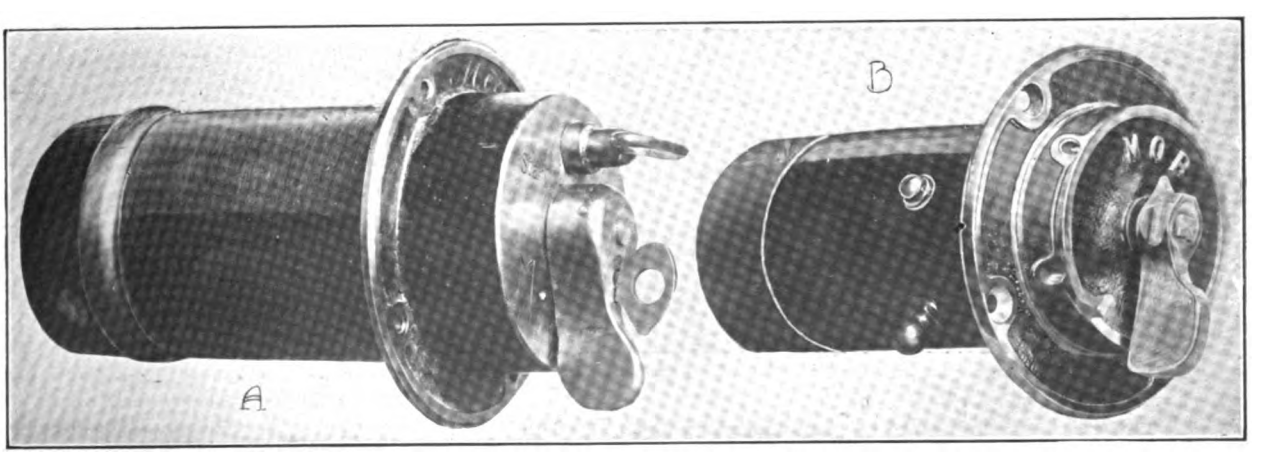

Fig 12—Dash Coils for Mea Dual Ignition: A, Type SS; B, Type SC.

Digitized by Google

the engine the switch may be on either battery or magneto. When starting from the seat or cranking, on either battery or magneto, the timing lever should

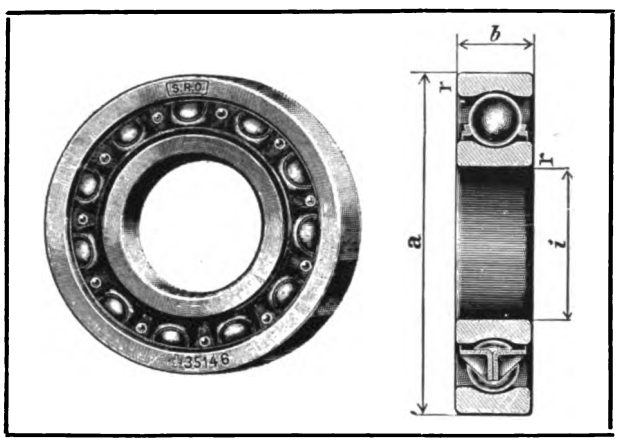

Fig. 13—Side View and Cross Section of S. R. O. Ball Bearing.

be placed in the position of full retard.

With the type SS all terminals are located at the rear end of the coil, while at the front are the switch and starting device. The latter is a mechanically actuated vibrator, by which one or a succession of sparks may be produced. In starting the switch is turned to the battery position and the starter slightly turned. When starting from the seat or cranking the timing lever should be full retarded.

For use in connection with the Gnome and Anzani aeroplane motors a special Mea magneto has been constructed. This instrument is built with a face plate that serves as a bracket. The magneto, of cylindrical form, is screwed against the housing of the motor, while a bracket has been cast in the magneto shell so that a special rod may be used as a brace. The form of the magneto is especially suited to aeroplane service. The retard and advance of the spark is the same as with all type A machines.

Lodge Double-Pole Spark Plugs.

The Lodge double-pole spark plugs are the product

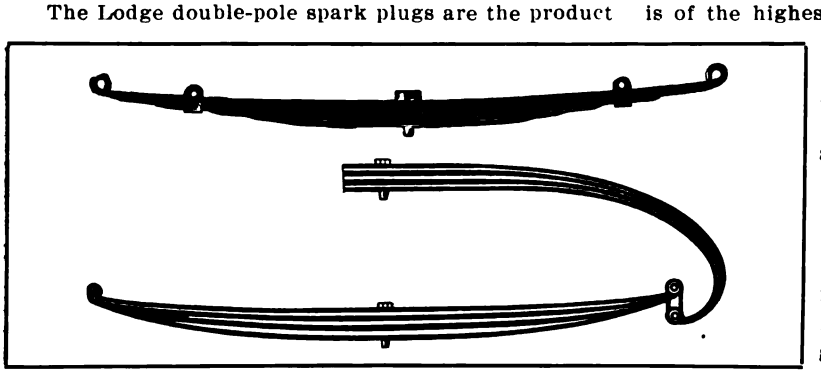

Fig. 14—Semi-Elliptic and Three-Quarter Elliptic Marburg-Hagen Automobile Springs.

of Lodge Brothers, Birmingham, England, a concern that has for years been known for the quality and character of its products. The advantage of increased power and efficiency of two point ignition, without the expense of using special double-commutator magnetos and double the number of wires from the magnetos to the cylinders, and additional wires from the magnetos to the switches, is obtained with the use of these plugs. These plugs are made with two concentric electrodes at the base of the core, both well insulated from each other and from the ground. There are two terminals above the shell or bushing. The main feature with these plugs is that there is no connection between the ground or between either of the electrodes. The usual form of plugs have one electrode grounded and the other insulated. It is maintained that these plugs give unusually efficient results and that with their use two point ignition may be obtained with the standard single point magnetos.

All that is required to obtain two point ignition with Lodge double-pole spark plugs is to have two standard plug holes in each cylinder and to connect the magneto and the plugs in such a manner that one electrode of the double-pole plug is connected to the magneto and the other electrode of the double-pole plug to the insulated electrode of the ordinary plug. The current from the magneto will thus pass through both plugs in series and fire both plugs at the same time. Of course the gain in power to be derived from the addition of a second plug in each cylinder will depend a great deal on the design of the motor and the condition of the mixture. Generally speaking, it will be greater.

Fig. 15 — Lodge Spark Plug.

S. R. O. Ball Bearings.

The S. R. O. ball bearings, made by the Schmid-Roost Works, Oerlikon, Switzerland, are produced by the oldest ball bearing maker in Europe. The workers have been specially trained and the workmanship is of the highest character. The bearings are all cut from solid steel, involving more work and greater loss of material than any other manner of manufacture. The limits for accuracy are guaranteed and the bearings are maintained to be as close as are made. The ball races are uninterrupted, as the notches for introducing the balls are shallow and do not reach the bottom of the races. The cage consists of two strong I shaped steel stampings riveted together, forming a T shape, which keeps perfect alignment. All bearings are carefully heat treated. The form of the ball races insures the least wear and the highest guarantee for end thrust endurance. The selection of the cage material prevents the formation of injurious

Digitized by Google

metallic dust, liberal lubrication is insured and a quality of service guaranteed that is supported by the experience of many concerns covering many years. A feature of particular interest in these bearings is that lubrication is forced, as the cage acts as a scoop. A proof of accuracy of the S. R. O. bearing is to remove carefully the brass rivets and take out the two halves of the cage. It will then be observed that the balls do not fall together, retaining their positions. The bearings are made for annular and thrust service in all standard sizes, and particular attention is given to orders for special sizes. The number of European firms now using the S. R. O. ball bearings evidences that the claims made for the bearings are justified by use.

Marburg-Hagen Springs.

The Marburg-Hagen springs, the product of a noted firm at Hagen, Germany, a city that is as celebrated in the spring industry as Sheffield and Solingen are in cutlery making, is another product exclusively imported by this firm. Spring making has been the chief industry of Hagen for generations and the workmanship is maintained to be unexcelled. The springs are made of pure carbon steel, no alloy of any kind being used, which ensures a far greater uniformity of product than is otherwise possible, with much less chance of the "off heats" that cause so much trouble. The temper of the springs is a vital factor and temper for them is so scientifically obtained that they are guaranteed to have an elastic limit of from 190,000 to 195,000 pounds per square inch. This high quality is regarded as explanation of the generally speaking considerably lighter weight of European automobile springs. The Marburg-Hagen springs are used on more than 50 per cent. of all the trucks and cars made in Belgium, France and Italy. These springs are specified for all the trucks required by the German war department.

The possibilities open to anyone with intelligence and foresight who engage in the automobile industry is certainly well exemplified by Marburg Brothers, sole agent in America for such accessories as the Mea magneto and the Lodge spark plugs, and for such essentials as the S. R. O. ball bearings and the Marburg-Hagen springs. Their business is established and assured while the explosive motor is used on land, water or in the air.

NEW FLANDERS ELECTRIC.

The Flanders Manufacturing Company, Detroit, is producing a new electric. Besides being higher in price than the previous model, it has a battery of 30 cells, distributed 20 in front and 10 in the rear, a larger motor and a better controller mounted on top of the steering column. The body design, altered to accommodate the new distribution of the batteries, is on the Colonial style of the previous model. The wheelbase has been lengthened by three inches, and the car will no doubt be popular among users of the electric vehicle throughout the country.

JERSEYMEN TO CELEBRATE RECIPROCITY.

The three automobile organizations of New Jersey are planning to celebrate on May 4 the passage of the new reciprocity bill for which the motorists of the state have worked so hard. A big testimonial dinner is to be tendered to Assemblyman Stickel and the other legislators who gave the bill their support and made its passage possible. Invitations went to 4000 or 5000 motorists, and it is expected that there will be a generous response, judging by the way the affair has appealed to the men who have been approached upon the subject.

Assemblyman Stickel is to be presented with the gold fountain pen with which the governor signed the bill, and Senators Colgate and Edge are also to be remembered. In fact, all concerned with the passage of the bill will no doubt come in for their share of the reward, and the occasion will be a notable one. Arrangements are in charge of a committee of 15, five from each of three clubs, as follows: W. Clide Crosby, chairman; Richard C. Jenkinson, Horace C. Cook, Ira Kipp, G. O. Groebe and Melville A. Carpenter of the New Jersey Automobile and Motor Club; Joseph H. Wood, Hon. W. Eugene Turton, J. H. Edwards, George A. Post, W. C. Crosby of the Associated Automobile Clubs of New Jersey, and George E. Blakeslee, George H. Smith, W. H. Ellis and C. Louis Fitzgerald of the New Jersey Automobile Trade Association.

HEARST TO BUILD MOTOR MART.

William Randolph Hearst is planning to reach the automobile industry by means of a building, in addition to his many newspapers No very detailed plans have been given out as yet, but so far it would appear that New York is to have a structure similar to Boston's well known Motor Mart. A building is to be erected on the block bounded by Columbus Circle, Central Park West, Broadway, and 61st street, especially designed for use by automobile dealers. It is said that the ground floor will accommodate 19 firms, and that the height will be four stories, faced with marble.

NEW ELGIN ASSOCIATION OFFICERS.

The annual meeting of the Elgin National Road Race Association was held recently, and officers elected as follows: President, Harry D. Hemmens; vice president, T. J. Schmitz; secretary, Wallace C. Wilson; treasurer, Philip Freiler; general manager, F. W. Jenks. The proposal of the Chicago Motor Club to hold five events, including a free-for-all, on the Elgin course, Aug. 23-24, was considered without any definite conclusion being reached. It was stated, however, that if it were found that the free-for-all would rob the Elgin National Trophy race of any glory, it would be eliminated.

CORRESPONDENCE WITH THE READER

Wiring Dual System.

(1360)—I have a ——— car fitted with the Bosch dual ignition system and in overhauling did not mark the wires. I have tried several ways of connecting them up but fail to get any results. Being a subscriber of your magazine, and noting you answer similar questions am writing to know if you will furnish me with directions for doing the work right. IRVING W. BLISS.

Pensacola, Fla., April 11.

The wiring diagram of the ignition system referred to is outlined in an accompanying illustration and it will be noted that four connections are required between the magneto and switch. Two of these are high-tension members and consist of wire No. 3 by which the high-tension current from the magneto is led to the switch contact, and wire No. 4 by which the high-tension current from either the magneto or coil goes to the distributor. Wire No. 1 is low-tension, and conducts the battery current from the primary winding of the coil to the battery interrupter. Low-tension wire No. 2 is the grounding wire by which the primary circuit of the magneto is grounded when the switch is thrown to "off," or to the battery position. Wire No. 5 leads from the negative terminal of the battery to the coil, and the positive terminal of the battery is grounded by wire No. 7. A second ground wire, No. 6, is connected to the coil terminal.

Depicting Method of Wiring Bosch Dual Ignition System.

In connecting up the leads to the spark plugs it should be borne in mind that the motor fires as follows: 1, 3, 4, 2. The dust cover is removed exposing the distributor member. The motor is then cranked until the No. 1 cylinder, that nearest the radiator, is compressing and the piston is at the top of its stroke. The distributor segment should be in the centre or approximately, this depending upon the original setting at the factory.

Assuming that the position is correct, the secondary cable is attached to the terminal and connected with the spark plug of the No. 1 cylinder. As the magneto rotates clockwise, the distributor segment will next come in contact with the No. 2 block. The cable connecting this should be led to the No. 3 cylinder, which is the order of firing, and not to the No. 2. The next contact point is the No. 3 and the wire leading from this is attached to the spark plug of the No. 4 cylinder. As the last cylinder to fire is the No. 2, and there is but one wire left to connect it will be an easy matter. In connecting secondary leads mistakes will be prevented if the firing order of the cylinders is considered in wiring. As the engine referred to fires 1, 3, 4, 2, the distributor numbers being 1, 2, 3, 4, are apt to be confusing to the novice. It will simplify matters by connecting the leads as follows:

Magneto terminal 1 to cylinder 1.
Magneto terminal 2 to cylinder 3.
Magneto terminal 3 to cylinder 4.
Magneto terminal 4 to cylinder 2.

Advance and Retard of Spark.

(1361)—Why do we advance and retard the spark, and what effect does it have in operating a motor?

F. H. K.

New Bedford, Mass., April 14.

Advancing or retarding the spark is incorporated in the ignition system of the internal combustion engine to cause the ignition of the mixture to take place theoretically when the piston is at the top or dead centre on the compression stroke. The maximum power is developed by the production of heat in the combustion chamber, or in other words, when a greater portion of the charge is burned. Part of the heat that is released by the combustion of the mixture expands the gases and produces pressure against the piston, while the balance is lost through the cylinder walls or passes out through the exhaust. The proportion of heat actually applied is very small. The highest possible efficiency would be obtained if the charge could be ignited and burned completely at the instant the piston was at the top of the compression stroke, but this condition does not exist in practise because of the time required for the flame to travel through the vapor from the point of ignition.

In order to bring about a complete combustion it is necessary to ignite the charge before the piston reaches the end of its compression stroke, so that during the latter part of this operation, and while the member is moving upward, the charge has begun to burn and the gases to expand. The amount of the advance necessary to bring about proper combustion varies according to the design of the motor.

With the single point ignition, the spark occurs in the cylinder at some point near the completion of the

Digitized by Google

compression stroke, this being such that the vapor will be completely ignited at the instant the piston attains dead centre. With a single spark plug located at one side of the cylinder, the flame must travel to the opposite side of the member in order to consume the mixture. This loss in time is offset by advancing the time of ignition, commonly known as "advancing the spark."

Screw Cutting Lathe.

(1362)—Can you inform me of any books on the operation of the screw cutting lathe that would be of any benefit to anyone in gas engine construction and repairing? Also, where can I obtain the necessary jigs and dogs to clamp on face plates, etc., to hold engine cranks, shafts, etc., for turning? P. J. FOSTER.

Throckmorton, Tex., April 12.

The Hill Publishing Company, New York City, publishes information of this nature. Regarding the jigs and dogs, these could be secured from any of the many concerns making these tools. The Braunsdorf-Mueller Company, Elizabeth, N. J., manufactures lathe appliances.

Power Tire Pumps.

(1363)—I wish to inquire regarding the probable outcome or effect of inflating a tire with a power pump that will pump in gas from a cylinder of an internal combustion engine. I have constructed a power pump out of an old spark plug to which I connect a tube leading to the shoe. In inflating I run the motor on three cylinders and find that I can inflate a tire in a very short time, and the operation does away with the drudgery of pumping. This of course pumps the tire with the gas and by compression from the cylinder. Is there any danger of the gas exploding and will the tire get hot enough to bring about an ignition of the mixture? Will the gas or compressed air injure the tube if no lubricating oil exists? J. R. SPANN.

Anderson, Cal., April 13.

According to a leading tire manufacturer the gasoline in the mixture will cause a rapid deterioration of the inner tubes. Regarding combustion, it is questionable if the car could be driven fast enough to produce friction that would ignite the mixture in the inner tube. If oil finds its way past the rings of the piston and thence into the inner tube it probably would injure the rubber in time.

Changing over Rims.

(1364)—I have a model ——— car and it is fitted with ——— rims. Am contemplating changing these for a quick detachable type. Was informed by the proprietor of the garage that it would require new wheels. Will you tell me if the work can be done without this added expense? C. E. READER.

Wilmington, Del., April 20.

To fit the rims desired the felloe will have to be built up about .5 inch or more. This work can be done successfully by any competent wheelwright and the expense will not be prohibitive. A strip of wood is steamed and fitted over the felloe and when the rim is shrunk on it will hold the auxiliary piece securely. The writer had similar work performed several years ago and the wheels are still substantial.

Covers for Tires.

(1365)—Having a car fitted with demountable rims, and carrying two extra members on the running board I wish to know if I should fit covers to these members? I was told that the air and sun had a deteriorating effect upon the rubber and that covers should be employed. I notice many cars carrying extra casings which are not covered. W. L. WOOD.

Washington, D. C., April 18.

Oxygen in the air hardens rubber which is also affected by oil or greases. The tires should be protected by covers as moisture is kept from the rims and in addition the appearance of the machine is considerably improved.

MILLER'S 22ND ANNUAL.

The 22nd annual catalogue of Chas. E. Miller, 97-103 Reade street, New York City, is a neat volume of 256 pages, filled with important news of the automobile accessory industry. The cover sets forth in a measure the nature of the contents—everything for motor cars, motor boats, motorcycles and motor planes. Chas. E. Miller is not only the largest automobile supply house in America, but it was the first, and its 15 stores in nine states gives it an enviable position in the supply business of the country.

The 256 pages of the 1912 catalogue will prove of double interest to the motorist. Not only will it be possible to find practically every article of merit with which he is familiar, but he will discover a wide variety of new things, which never have been called to his attention before. In short, it is a remarkable compendium of automobile accessories and supplies, as would be expected with the largest house in America.

Among the better known articles listed may be mentioned: Brampton chains, Sager equalizing springs, Truffault-Hartford shock absorbers, F. & S. ball bearings, Bowden wire, R. I. V. bearings, Duplex brakes, Gyrex the mixer, Rayfield carburetors, Dover funnels, Panhard oils, Pan-American lubricants, Dixon's graphite, Blue Ribbon polishes, Coes wrenches, Mea, Bosch and Splitdorf magnetos, Geiszler batteries, Firestone rims, Weed chains, United States, Firestone, Goodyear, Michelin and Motz tires, Sager bumpers, Jericho and Newtone horns, Jones and Stewart speedometers, Gray & Davis lamps, etc. A full list would read like an index of the accessory business. The book should be in the possession of every motorist, and will be mailed upon request.

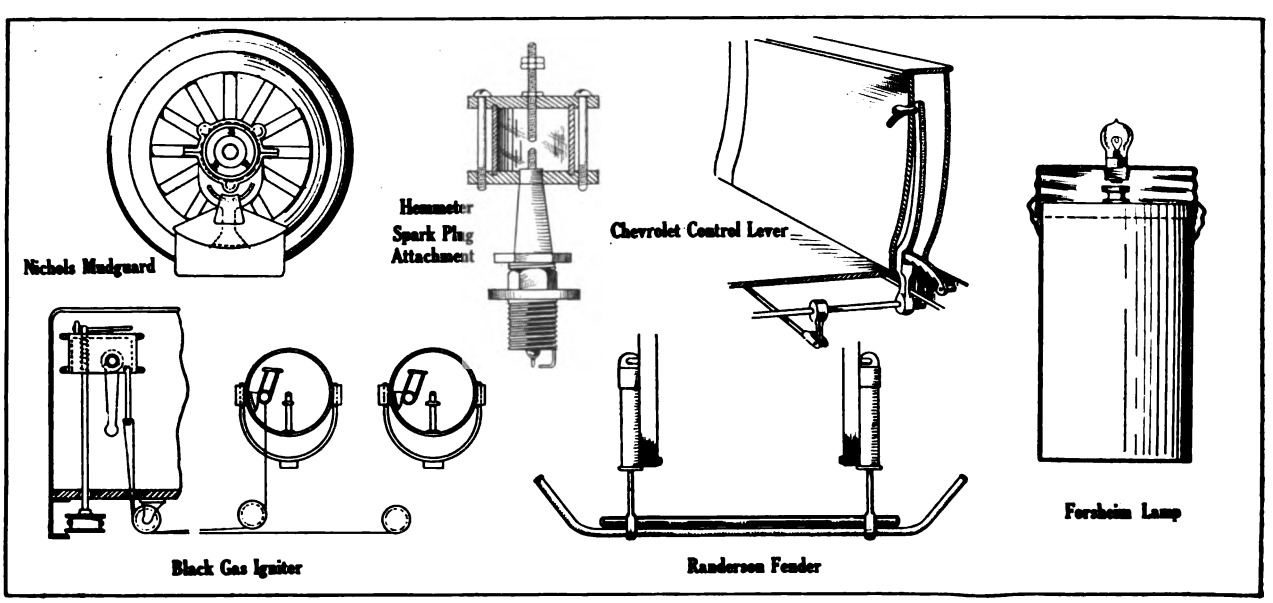
FLAGG ON KNIGHT ENGINES.

James Montgomery Flagg, well known as a humorist and artist of distinction, recently purchased a Columbia-Knight touring car, made by the Columbia Motor Car Company, Hartford, Conn. His description of the silent running qualities of the machine is decidedly distinctive, as follows: "The operation of the Columbia-Knight reminds me of a deathlike quiet; like a man walking on rubber heels. I must blow the horn to avoid running down people, and you know a man does not like to be continually blowing his own horn."

Digitized by Google

RECENT MOTOR VEHICLE PATENTS

Nichols Mud Guard.



There has been considerable agitation abroad regarding the splashing of mud upon pedestrians by the wheels of motor cars and the subject has received some attention in this country. Charles Hillyard Nichols, Wolverton, England, has patented a mud guard which is attached to the hub of the road wheels, this consisting of a ring having adjustable means incorporated and interposed between it and the hub of the wheel, also a method of retaining these in this position. A rotating ring is mounted upon the first and attached to this is a weight which keeps the guard in normal position. It is claimed by the inventor that any mud or water splashed by the wheel will strike the guard and be deflected inwardly toward the wheel.

Hemmeter Spark Plug Attachment.

An attachment for a spark plug has been patented by Henry C. Hemmeter, Pontiac, Mich., assignor of one-half to Cassius C. Van Wagoner of the same place. It differs from the usual spark gap device inasmuch as it is attached to the plug itself and means are provided to prevent the spark from igniting any gasoline vapor which may be in the vicinity of the flame. The device comprises two circular plates of non-conducting material and these are recessed to take a glass tube. The parts are held securely by screws. The lower insulated plate is fitted over the binding nut of the electrode from which the terminal is removed in practise. The upper plate carries an adjustable threaded member and when a space is left between it and the regular electrode, the spark will jump across the gap. It is claimed by the inventor that the action of the current may be noted readily and that any soot or oil between the points of the spark plug will be removed by the device. Means are provided for fastening the attachment to the spark plug.

Chevrolet Control Lever.

Louis Chevrolet and Etienne Planche, Detroit, assignors to the Chevrolet Motor Company of that city, have been granted a patent for a control lever which is unique in its location, inasmuch as only that portion grasped by the hand is in view. The device consists of a false door formed with an inner and outer wall in which space the control lever is concealed, as is the gate or quadrant. The lever is curved to conform with the shape of the fore door and is operated by means of a horizontal handle extending inwardly through a curved slot. It is claimed by the inventors that concealing the lever not only improves the appearance of the car but inside control is obtained

Outlining Some of the Recent Ideas of Inventors of Parts and Accessories Applicable to the Automobile, Including Control Lever, Fender, Electric Lamp and Gas Igniter.

Digitized by Google

without interfering with the comfort of the operator or occupant of the other front seat. It is also pointed out that the member is less likely to be tampered with when the machine is left unattended on the street.

Black Gas Igniter.

In these days of refinement considerable attention is being paid to devices which will control, light and extinguish acetylene headlights from the seat. Allen G. Black, Springfield, Mass., has patented a gas controlling and lighting apparatus for motor cars which is operated by a handle or lever convenient to the driver. The gas tank is fitted with a valve having a rotative stem and another similar wheel is attached near the front seat. These members are connected and operated by a cord. The latter is actuated by a lever or shaft by means of which the flow of acetylene is controlled. The lighting device consists of a spring wire, the middle portion of which is coiled, while its extremities are approximately parallel. These ends are fitted with means for igniting the gas, combustion taking place when one of the pivotally mounted legs is actuated. A retracting spring is provided to return the device into its normal position. The other leg is connected with the controlling mechanism and means are incorporated for operating the cord.

Randerson Fender.

Letters patent have been granted to John P. Randerson, Albany, N. Y., for an automobile fender in which is incorporated means for not only resisting the shock of compact but taking care of the recoil. Two fender bars are utilized, these being similar in construction to the usual devices of this nature. These rods are supported by hinged members, extensions of which are fitted to tubes containing cushioning springs. The spring carrying members are fastened to the vehicle. When the fender comes in contact with an object it is claimed by the inventor that the springs absorb the shock and eliminate any danger from recoil.

Forsheim Electric Lamp.

Joseph Forsheim, New York City, has been granted a patent for an attachment to a dry cell which presents practical features, inasmuch as the device is simple and attached easily. It consists of a cap or casing having spring like retaining arms and so arranged that the terminals of the positive and negative poles come in contact with similar members of the device. Means are also incorporated whereby the supply of current may be cut off as desired. The electric bulb is screwed into the top of the casing and when the components are assembled the dry cell may be utilized for an inspection lamp and for other purposes as well. The inventor points out that with his device a motorist may utilize one or all of the dry cells in the car for lighting purposes whereas with the ordinary inspection lamp with battery self-contained, the service is limited.

Motorists should see that their individual states require lights on all vehicles using the highways at night.

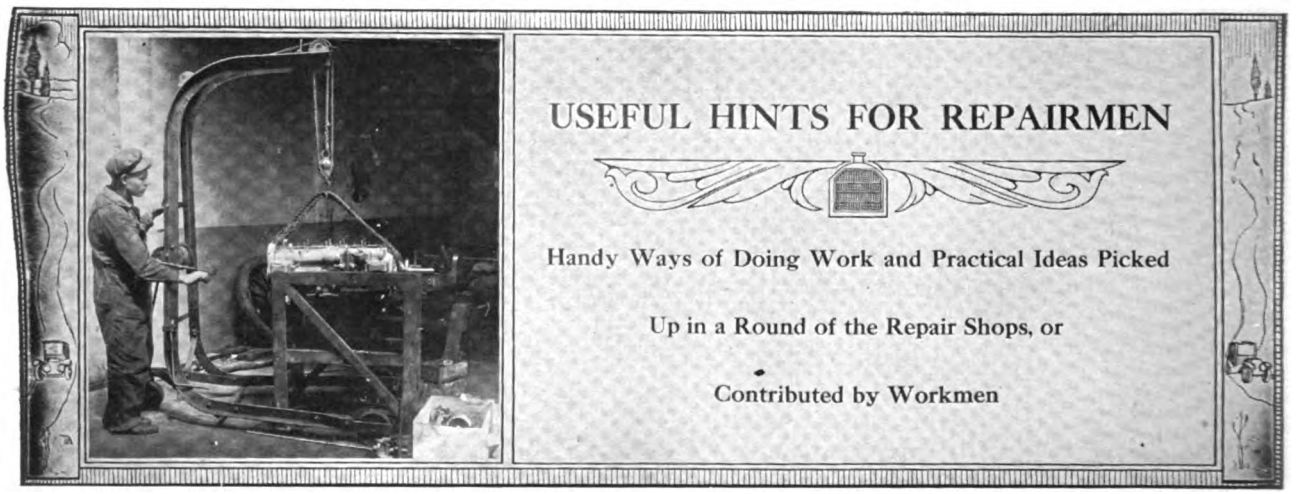
THE MILLIONTH BOSCH MAGNETO.

Those who seek to estimate the extent of the production and popularity of the international combustion magneto will be interested to note that March 25 marked the completion of 1,000,000 Bosch magnetos, by the Bosch Magneto Company of New York City. In this connection, it may be mentioned that the demand for this ignition equipment is increasing to an extent that requires continual additions to the factory sites.

WORLD'S FAIR OF AUTOMOBILES.

As a name for the proposed national exhibition of motor cars in Detroit next fall, R. C. Hupp, president of the R-C-H Corporation, maker of R-C-H gasoline and Hupp-Yeats electric cars, suggests "World's Fair of Automobiles." He believes that much of the value of the display will be lost if a name is selected which conveys a local meaning. In addition, he believes that advertising the exposition in this manner will impress upon the motoring world the place Detroit holds in the automobile industry.

L B A BATTERY BUSINESS GROWS.



As an indication of the amount of interest being developed in electric lighting throughout the country, it is worthy of note that the Willard Storage Battery Company, Cleveland, O., maker of L B A batteries for lighting and starting, has been forced to give up its present office space to the manufacture of additional equipment. The executive offices are now located at 5716 Euclid avenue, and the old quarters are being utilized in the production of batteries. The rapidly growing business of the concern makes it necessary to secure more room at once, and ground has been broken for a factory extension which will add approximately 25,000 square feet to the present facilities.

GOODYEAR TIRE PRODUCTION.

Few motorists appreciate the number of tires represented in the daily output of some of the larger manufacturers. The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, in celebrating its birthday recently, made arrangements to increase its production of 4000 tires a day to 5000. P. W. Litchfield, factory manager, offers an interesting suggestion in the following:

"If a procession of automobiles 1.5 miles long were lined up in front of the Goodyear plant, the daily output would equip these machines with a gang of men steadily affixing the tires. The aggregate output for the year would equip a string of automobiles that would reach almost from New York City to San Francisco. By piling the 1912 production of tires on top of each other, they would reach a height 40 times that of the Singer building in New York City."

TOOLS FOR THE SHOP.

As business increases the proprietor of the small repair shop will add to his equipment from time to time, purchasing small tools as the work requires. There are a number of small tools which are indispensable, such as drills, reamers, taps, etc., and these may be bought singly or in sets, according to the convenience of the owner.

A scriber is a very useful instrument and is made in two forms, one a single point member for ordinary use and the other a double point. The tool depicted at Fig. 1 A, has points made of tool steel, finely tempered, threaded to screw into the holder which is knurled for a finger grip. The holder has long bearings to support the points firmly when in place and is of a suitable size to be held conveniently.

Reamers are made in several forms for different work, and are useful for enlarging holes. At B is shown a type of solid hand reamer while that at F is for roughing and finishing. In fitting taper pins the tool illustrated at E will be required. As the machine equipment of the shop is increased other tools of this nature will be added such as rose, expansion, chucking, shell, etc.

Drills.

With the drill equipment should be included a countersink, and a tool combining a centre drill and countersink is shown at Fig. 2 C. When very true work is required it is preferable to so shape the countersink that the lathe centre will first bear at the smallest part of the cone. This will cause the countersink to wear and keep true with the hole. If the centre drilling is to be done by hand it is important to relax every few seconds the hold upon the work to permit it to make about one-third of a revolution, which may be done while the other hand is supplying oil to the drill. The object and effect of this is to cause the centre drilling to be true, which otherwise it would not be, especially if the work be comparatively heavy, or one side heavier than on another.

Twist drills when utilized with power, come in sets, and with each is a steel socket which fits the drill press spindle at one end, and at the other the recess takes all drills in the set. One of the holders is outlined at Fig. 1 C, and to enable the drill to be extracted easily from the socket, the latter is provided with a slot, which passes entirely through it. The drill end protrudes into this slot, so that if a key or wedge be driven into the opening, the drill will be forced out. Conventional types of drills are shown at Fig. 2, A and B, the former being adapted to the drill holder mentioned above.

Taps.

Machinists' hand taps are made in three different styles, taper, plug and bottoming, and these are de-

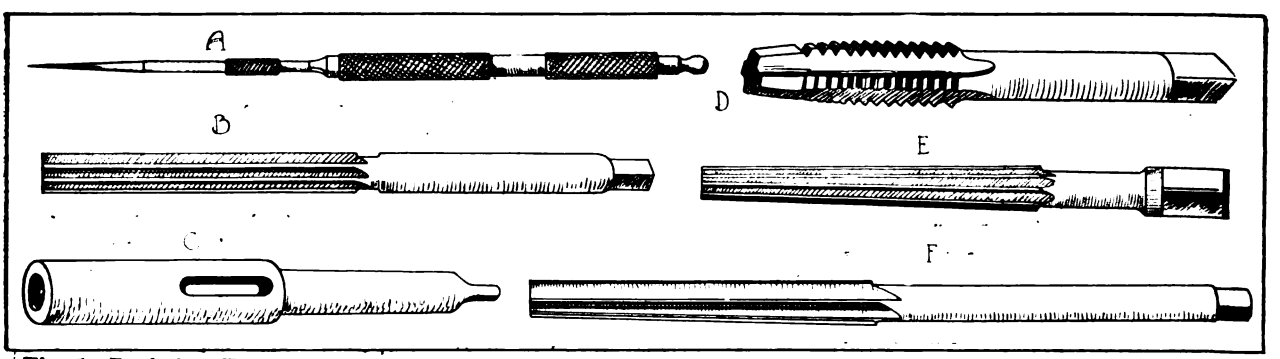

Fig. 1—Depicting Tools for the Shop Equipment: A, Scriber; B, E and F, Reamers; C, Drill Holder; D, Short Hob or Master Tap.

Digitized by Google

picted at Fig. 2, D, E and F. Tools for use in holes to be tapped deeply should be of slightly larger diameter than those employed for shallow ones, because in deep holes the tap is held steady by its depth in the hole, and whatever variations there may be between the pitch of the threads in the hole and those on the bolt, is experienced to a greater extent as the length of the thread increases. A short Hob or master tap is outlined at Fig. 1 D.

QUIETING NOISY VALVE ACTION.

With the introduction of the sleeve valve motors the manufacturers of engines utilizing the poppet valve have brought out refinements which render the action of the valve mechanism noiseless. Some makers enclose the valves, which not only deadens any existing noise, but protects the parts from wear by excluding dust attracted by the oil. Many motors, however, especially those of early designs, are not constructed so that a plate may be fitted without considerable work. To meet the demand for a valve quieting device, an English concern has brought out what is termed a "silent tappet sock," and its principle is similar to a device outlined in The Automobile Journal recently.

The attachment is made in two styles and these are depicted at Fig. 3. That at A shows a method which includes the use of two tubes of different diameters, one being threaded externally at the lower end and the other internally at its upper end. To place the device in position it is necessary to remove the valve, and with the two tubes telescoped one within the other, as shown at B, they can be slipped over the valve spring and held against the valve guide while the valve, cap and cotter key are replaced. The larger tube is then allowed to drop down and enclose the lower part of the valve stem and spring, and is screwed onto the external thread of the smaller tube, as outlined at A. The lower tube is equipped with a hexagon to permit of the parts being screwed together. The valve tappet guide is altered slightly to provide a good seat.

The other design is illustrated at C and consists of a single tube which is split longitudinally, the abutting halves being formed as shown at D. The tube is chamfered top and bottom and the latter is held firmly in place by a coned nut, which is intended to be screwed onto the top of the tappet guide. This guide should have sufficient substance to allow a thread to be cut, and will have to be removed for the work.

METHOD OF DRILLING GLASS.

Although the repairman is seldom called upon to make repairs to the accessories constructed of glass such as the windshield and lamps, the fitting of sight feed oiler tubes and dials requires a knowledge of how to handle glass, such as cutting, drilling, etc. Where a slight crack appears in a windshield further damage is prevented by drilling two small holes and fitting a device similar to that utilized on large store windows. It may be possible that an owner desires an opening cut in the windshield for use in stormy weather.

Glass may be drilled with a small tool by using turpentine as a lubricant, but this has its disadvantages inasmuch as the tool has to be resharpened frequently as well as that the diameter of the hole is apt to be larger at the top than at the bottom, also it is difficult to drill holes of equal size.

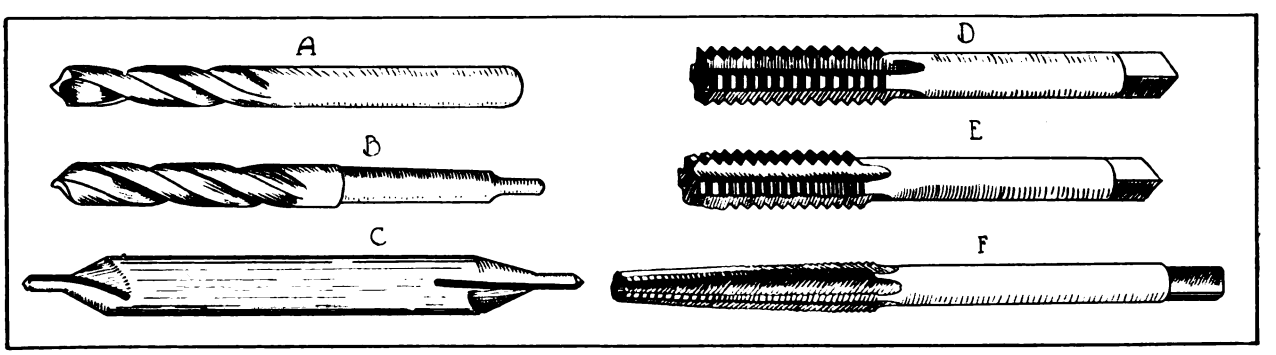

Fig. 2—Tools for the Repair Shop: A and B, Twist Drills; C, Combined Drill and Countersink; D, E and F, Taper, Plug and Machinists' Bottoming Taps.

Drilling may be accomplished successfully by utilizing a brass tube of the diameter of the desired hole. The end of the pipe is trued up to secure an even bearing upon the glass and a small opening made in the side of the tube through which the abrasive is introduced during the process, this being done so that the tool will not have to be lifted during the work.

In starting the drill a piece of wood is utilized having an opening of the same diameter as the tube and the guide is attached to the work. The drill may be operated by a drill press or hand drill and during the operation the cutting paste may be fed to the tube by an oil can. If a sharp edged hole is desired, a thin piece of glass may be placed over the work and held in position by French copal varnish.

In fitting glasses to lamps, such as head or side members, if the circles be cut by the repairman the

Digitized by Google

edges are likely to be jagged or rough. It is essential that the glass fit accurately and sometimes a trifle has to be removed. The rough edges may be smoothed by utilizing a bastard file kept liberally moistened with the following solution: Pulverized camphor, two ounces; sulphuric ether, six drams, and enough oil of turpentine to fill the remainder of a six-ounce bottle.

CLEANING OUT RADIATORS.

A repairman of considerable experience recommends the use of sal-ammoniac for cleaning out the circulating system of a motor and states that a pound of this material dissolved in water and poured into the cooler will remove "fur" and incrustations. The fluid should be left in the system and the car operated for two or three days, then removed. If chemical action is going on it will be noted by the odor of ammonia.

BALL BEARING LUBRICATION.

In assembling components of the car fitted with ball bearings some repairmen employ any kind of oil

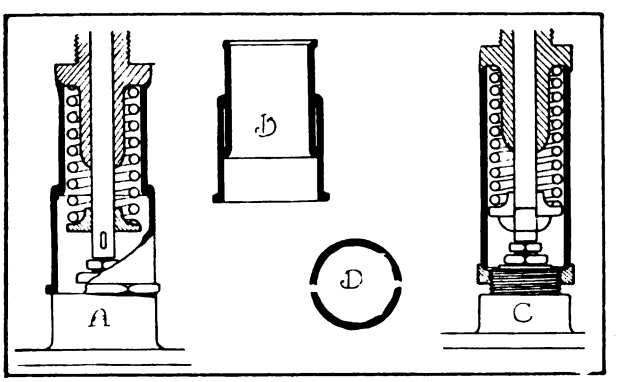

Fig. 3—Methods of Quieting Noisy Valve Action: A, Telescoping Tubes; B, Outlining Operation of Assembly; C, Employing Split Tubes; D, Showing How Tubes Are Constructed.

or grease, usually that which is the handiest. Makers of ball bearings state that the parts must be protected from the atmosphere and that the lubricant should be a small amount of light oil. The latter should be particularly efficacious against the action of water and one having a very small percentage of oleic acid. When the bearings are small, they should be lubricated with an oil recommended by the maker of these components.

STRETCHING VALVE SPRINGS.

Sometimes the clattering noise of the valve mechanism is due to the weakness of the springs. When such a condition exists the best method is to fit new members. Sometimes an owner will object to the expense and the only alternative for the repairman is to renovate the old springs. This may be accomplished by removing and stretching the members, by securing one end in a vise and tying a cord to the other extremity. Care should be exercised, however, not to increase the tension to a point where the springs will close the valve with so much force as to break the stems. In addition, too stiff a spring consumes extra power. Another method is to insert washers under the lower end of the spring.

LONG WITH NATIONAL CARS.

There is a certain value in the cumulative experience that comes with long association with the same company in studying problems affecting the product of that concern, and it is with considerable pride that the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, points to the fact that its executives have splendid records for long continuous service. President A. C. Newby has been at the head of the company for years, George M. Dickson, general manager, has been with it since 1902, and W. G. Wall has been chief engineer since the company was organized.

TO TEST REGISTRATION LAW.

Preparations are being made by a number of motorists in Jackson, Miss., to test the constitutionality of the recently enacted registration law in that state, and the outcome of the case will be watched with interest by automobile owners throughout the country. It is understood that these men do not object to a tax on automobiles, as such, but they believe that the act can be construed as class legislation and propose to determine whether or not it is constitutional to tax automobiles for using the highway without imposing like fees upon horses, mules or ox teams.

HIGHER GARAGE RATES IN HARTFORD.

Motorists in Hartford, Conn., will hereafter have to pay higher rates for garage service, six of the principal garages having decided to raise their charges. According to the new figures, cars with a wheelbase up to 112 inches will cost $15 a month for storage; those of a greater wheelbase, $20 a month; and limousines and all closed cars, $25 a month. Washing and polishing is included in the service given at these figures.

LONG TRIP IN BRUSH.

F. H. Bachmann, a travelling salesman who uses a Brush runabout, made by the Brush Runabout Company, Detroit, to cover his territory, recently made a round trip between San Antonio, Tex., and Detroit, thus adding some 6000 miles to a record of 5000 made before the journey. The car found some bad roads in the South, particularly in Oklahoma, Mississippi, Missouri, Kansas and Iowa, but came through without difficulty.

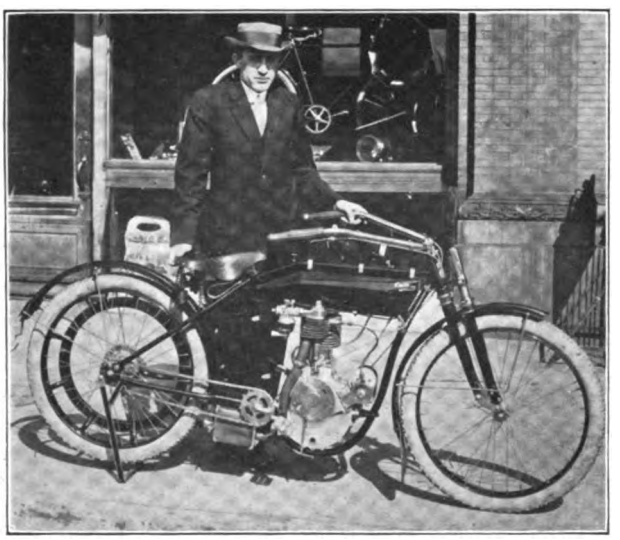
ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Dealer as Recruiting Officer.

There is abundant evidence throughout the country that the dealer realizes the importance of the local motorcycle club in increasing his facilities for doing business. This does not mean that the club is considered in any way as a means of working the members for the personal ends of the dealer. It is true, however, that the agent can make legitimate use of the good fellowship represented by the organization in securing and retaining the interest of men who are not riders and who are not in any way identified with the club.

By this is meant that no wide awake dealer will lose sight of the fact that a mention of the club and its activities, as well as of the Federation of American Motorcyclists and its splendid work for the benefit of motorcycling in general, will serve as an added inducement to the man who is considering the purchase of a machine. If the latter is assured that through the possession of a mount and membership card in the local club he becomes identified with the thousands of riders throughout the country, who are banded together in the interests of good roads, better legislation and a wider friendship, he is more easily induced to invest.

Members and Friends of the Rhode Island Motorcycle Club at Their Annual Smoker.



Some dealers have found it a profitable experiment to present the new purchaser with a club membership. The least they can do is to call the attention of their prospects to the benefits accruing to them through identification with the local body and the national federation, both of which are now, and have been for some time, working for his interests indirectly. If he be so inclined the dealer may become the best recruiting officer the club can secure.

Rhode Island Club's Smoker.

The annual smoker of the Rhode Island Motorcycle Club, Providence, R. I., was held April 17, some 75 members and their friends enjoying the affair, despite the stormy weather. The event was quite in keeping with the standard set in past years, and reflected much credit upon the committee, which consisted of President Ryder, Vice President Halstead, Secretary Medhurst and Hirah G. Baxter. An accompanying illustration presents a photograph taken during the progress of the festivities and gives an excellent idea of the class of men which compose this affiliated club No. 9. While the boys were engaged in burning up the excellent cigars provided by the committee, they were entertained by a programme of song, orchestral music, and vaudeville acts, and later a Dutch supper was served. Perhaps the most interesting feature of the evening was the presence of W. L. W. Hillman, who, it will be remembered, suffered a fracture of the neck in one of the club runs last June. He had so far recovered from his experience as to take a ride in a sidecar with J. C. Loftus on a Harley-Davidson, less than a week before the smoker. His remarkable recovery was a subject for much congratulation on the part of the other members, as well as for Mr. Hillman himself, and he was heartily greeted by all present. In the picture President Ryder is the gentleman in the centre with side whiskers, while Mr. Hillman is the second man on his right.

Digitized by Google

James H. Shippee, one of the older members of the club, now located in Los Angeles, Cal., as special representative of the Pope, sent a letter, which was

G. H. Bangham, Secretary-Treasurer Columbus Motorcycle Club, and His Emblem.

read by President Ryder. He informed the boys that even though the members of the Los Angeles Motorcycle Club had treated him royally since his arrival in that city, he always would have a warm spot in his heart for the Providence riders.

Recent Affiliations.

As predicted by Chairman E. M. Estabrook of the membership committee of the Federation of American Motorcyclists, the list of affiliated clubs has begun to increase rapidly with the approach of the riding season. Since the publication of the last list, the following additions have been made:

Harley-Davidson Motorcycle Club, Philadelphia, Penn., No. 240; F. B. Shenh, secretary, 2204 North Broad street, 19 members. Attleboro Motorcycle Club, Attleboro, Mass., 241; C. H. Obrist, 22 Fourth street, 31. Herkimer Motorcycle Club, Herkimer, N. Y., 242; T. K. Kelley, 215 Dewey avenue, 22. Valejo Motorcycle Company, Valejo, Cal., 243; D. R. Rutherford, box 382, 14. Whittier Motorcycle Club, Whittier, Cal., 244; Horace B. Miller, Rivera, Cal., 13. Bay Ridge Motorcycle Club, Brooklyn, N. Y., 245; R. G. Hanna, 859 61st street, 17. Luzon Motorcycle Club, Manila, P. I., 246; Thedore Siddall, box 550, 18. Bradford Motorcycle Club, Bradford, Penn., 247; N. M. Neilly, 75 Main street, 12. Berkeley Motorcycle Club, Berkeley, Cal., 248; E. B. Ellis, 1121 Laurel street, 17. Vincennes Motorcycle Club, Vincennes, Ind., 249; Thomas Bouchie, 903 North Seventh street, 22.

Coming Events.

The following race meets have been arranged by motorcycle clubs throughout the country: April 26, Augusta, Ga.; May 5, Peoria, Ill., and Brooklyn, N. Y., the latter the annual century and double-century events of the Invincible Motorcycle Club; May 12, Newark, N. J., opening meet on the motordrome; May 19, Detroit; May 30, Lancaster, Penn.; Washington, D. C., and Joliet, Ill., the last named being a 100-mile event under the auspices of the Will County Motorcycle Club; July 4, Cortland, N. Y., and Detroit; Sept. 2, Detroit. In addition, mention should be made of the annual tour of the Shortgrass Motorcycle Club in Kansas, Nebraska, Colorado and Wyoming, which starts Aug. 17.

Club Notes Here and There.

The San Jose Motorcycle Club, San Jose, Cal., has inaugurated a scheme of fining its members for overspeeding, in addition to any fine imposed by the city magistrate.

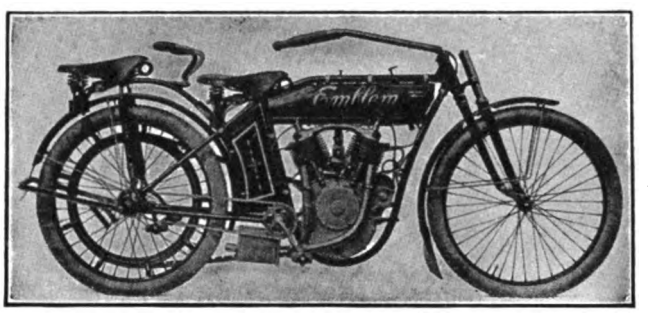
The recently organized Jersey Motorcycle Club, Bloomingdale, N. J., has elected the following officers: President, D. W. Voorhis; vice president, W. H. May; secretary, H. J. Hough; treasurer, H. T. Post; captain, E. C. Gurnee; lieutenant, W. A. Elliott; mechanician, H. W. Fredericks.

The Traymore Motorcycle Club, Philadelphia, has secured handsome quarters at 623 West Girard avenue. The following have been selected as officers: President, A. J. Schickling; vice president, Harry Gerlach; secretary, Henry Warker; treasurer, C. Kieffer; recording secretary, William Germann.

The Lincoln Motorcycle Club, Lincoln, Neb., has elected the following officers: President, E. H. Gumbel; vice president, Albert Keens; secretary, Ray Blakewell; treasurer, W. E. Gumbel; captain, J. R. Mawson.

The Kings County Motorcycle Club has been or-

James H. Shippee, Special Representative of the Pope in Southern California.



ganized at Hanford, Cal., with the following officers: President, S. Raney; vice president, Elmer Bechma; secretary, M. Homan; treasurer, W. O. Pickrill.

ANGOLA ERIE COUNTY NEW YORK

The Hoquiam Motorcycle Club has been organized in Hoquiam, Wash., with a membership of 22, all of whom are to become members of the F. A. M. C. J. Ritchie is president and W. B. Ogden, secretary-treasurer.

The St. Cloud Motorcycle Club, St. Cloud, Minn., has elected the following officers: President, A. E. Bakeman; vice president, George Thielman; secretary, Eugene Scharenbroich; treasurer, Charles Harrison; captain, Herbert Gray; first lieutenant, Lee Peffer; second lieutenant, Harry Sartell.

Norwich Wants Summer Cottage.

At the recent annual meeting of the Norwich Motorcycle Club, Norwich, Conn., plans were discussed for securing a cottage on the banks of the Thames river, in which the members will be able to spend their nights during the summer and yet have ample opportunity to get back and forth to their work in the city. The following officers were elected: President, C. C. Simpson; vice president, H. F. Burdick; secretary and treasurer, C. V. Pendleton, Jr.; captain, William C. Bode, Jr.; first lieutenant, Richard Fillager; second lieutenant, Peter Desjardins; directors, Maurice Sherman and Ellsworth Williams.

Providence Club Activities.

No date has been set for the formal opening of Motorcyclists' Home, the new headquarters of the Providence Motorcycle Club, Providence, R. I., in the Swenson building, but it will be some time during the early part of May. Invitations will be issued to all the clubs in that section of New England, and it is anticipated that the entire top floor of the building will be required to house the crowd.

At the meeting of the club April 12, arrangements were made for the annual "Herring Run" to Taunton, Mass., which is scheduled to take place either April 28 or the following Sunday. This event is awaited with interest by all the members, as it marks the official opening of the run season with the Providence club.

Several of the boys have been taking part in long distance spins during the past few weeks, among them being a run to Boston and another to Summit, R. I.

April 14, B. A. Swenson and two other members of the club went over the road to Berlin, Conn., by way of Worcester and Springfield, Mass. On the return trip,

Ray Seymour and His Indian Racing Machine.

Swenson made the 98 miles between Springfield and Providence in three hours, which is remarkably good time, considering the condition of the roads at this season of the year.

Tuileries Track Opening.

Twenty-five hundred people saw the opening race meet on the Tuileries track in Denver early in the month, during which G. R. Boyd on an Indian created a new track record for single-cylinder machines, riding an exhibition five miles in 4:30.2. The summary follows:

Two miles, amateurs—First, Shepherd, Merkel; second, Beck, Merkel; third, Hurlburt, Indian; time, 2:44.

Three miles, professionals, class B—First, Patterson, Merkel; second, Bowen, Merkel; time, 2:29.8.

Three miles, professionals, class B—First, Fleckstein, Indian; second, Swartz, Indian; time, 2:18.

Five miles, professionals, class B—First, Swartz, Indian; second, Cox, Merkel; time, 4:06.

Three miles, professionals, class A—First, Armstrong, Excelsior; second, Swartz, Indian; time, 2:24.

Three miles, professionals, class A—First, Armstrong, Excelsior; second, Fleckstein, Indian; time, 2:19.

Five miles, professionals, class A—First, Armstrong, Excelsior; second, Fleckstein, Indian; third, Swartz, Indian; time, 3:46.4.

Seven miles, open—First, Armstrong, Excelsior; second, Swartz, Indian; third, Patterson, Merkel; time, 5:33.

Benefit Meet for De Rosier.

The riders in Los Angeles responded generously early in the month to the plan for holding a benefit meet for Jacob De Rosier, who was injured so badly recently that he is not expected to ride again. W. E. Hasha on an Indian created a new record for a mile, going the distance in 0:39.8. The results in the other events follow:

Two miles, match—Dead heat; Dekerin, Indian and Allbright, Indian; time, 1:47.6.

Two miles, professionals, class B—First, W. Samuelson, Indian; second, Humiston, Indian; third, Allbright, Indian; time, 1:32.4.

Two miles, professionals, class A—First, Hasha, Indian; second, Ward, Indian; third, Seymour, Indian; time, 1:27.2.

Three miles, professionals, class B—First, W. Samuelson, Indian; second, Allbright, Indian; third, Humiston, Indian; time, 2:20.

Three miles, professionals, class A—First, Hasha, Indian; second, Ward, Indian; third, Seymour, Indian; time, 2:04.8.

Five miles, professionals, class B—First, Allbright, Indian; second, Humiston, Indian; time, 3:41.2.

Four miles, professionals, class A—First, Seymour, Indian; second, W. Samuelson, Indian; third, Ward, Indian; time, 2:51.

Flanders Carries Excess Weight.

An accompanying illustration indicates that the four horsepower Flanders, made by the Flanders Manufacturing Company, Pontiac, Mich., is capable of withstanding an excess weight of some hundreds of pounds. The machine is owned by W. E. Tomlinson, a Texas ranchman, who weighs 263 pounds and is shown in front. His friend tips the scales at 258. This makes 521 pounds in addition to the guns and other hunting equipment. The photograph was taken while the two men were on a recent hunting trip, and they claim to have ridden home with a still bigger load.

Plan Long Distance Tour.

Three Detroit motorcyclists and their wives are

W. E. Tomlinson and Friend Testing Capacity of the Flanders.

planning a transcontinental tour, which they expect will take them two years to complete. The men are Reuben Winslow, John Schnall and A. Wellman. They

Digitized by Google

will leave Detroit some time in June and will take the southern route to San Francisco. They expect to spend the winter in California, working at their trades, and return East in 1913.

Streiff on Foreign Tour.

William Streiff, who has only recently completed a 5000-mile motorcycle tour through England, Scotland, Wales, Ireland, France, Germany and Italy on an N. S. U. mount, reports that he made the trip in record time and has compiled a set of figures showing the distance and time from city to city. He used a Jones speedometer, made by the Jones Speedometer Company, New Rochelle, N. Y., in securing his data. This concern has made a specialty of producing reliable motorcycle instruments, which have been in service with riders in this country and abroad for some time.

Somebody Erred in Texas.

Those who were responsible for the recently enacted motoring law in Texas forgot to take the motorcycle into consideration, and as a result, according to Assistant Attorney-General O. C. Funderburk, the two-wheeled mounts are subject to all the requirements of the ordinary automobile. Until this ruling was received several cities throughout the state were permitting motorcycles to be operated without registration. San Antonio demanded that they be registered and that riders take out a license to operate. This brought the whole matter to the attention of the attorney-general's office wih the above result. It would appear that the F. A. M. must proceed at once to secure a correction of the apparent error.

Manufacturers Meet in Buffalo.

Several matters of importance came before the meeting of the Motorcycle Manufacturers' Association in Buffalo, N. Y., April 10. President A. B. Coffman, representing the Consolidated Manufacturing Company, was in the chair and Secretary J. F. Cox, representing the Pope Manufacturing Company, kept the minutes. The other members present and the concerns they represented were: W. G. Schacht, Emblem Manufacturing Company; Edward Buffum, Hendee Manufacturing Company; Arthur Davidson, Harley-Davidson Motor Company; J. F. Merkel, Miami Cycle & Manufacturing Company; A. B. Coburn, Pierce Cycle Company; C. W. Mason, New Era Auto Cycle Company, and W. T. Marsh, American Motor Company.

The motorcycle rim standard adopted by the Automobile Clincher Tire Association in Cleveland was turned down unanimously, and the matter left to the engineers at the various factories for a final decision. These will confer with the tire and rim representatives at Cleveland and agree upon a standard that will be acceptable to all parties concerned.

Resolutions were passed calling upon the mayors of the large cities throughout the country to take steps to secure the abatement of the muffler cut-out. Initial steps were taken toward securing lower freight rates. An application for membership from the Triumph Manufacturing Company, Detroit, was received and referred to the proper committee. The next meeting will be held in Toledo, O., June 5.

Valiant With Merkel Forces.

The many friends of Frank Libbey Valiant throughout the country will be glad to learn of his appointment as assistant advertising manager of the Miami Cycle & Manufacturing Company, Middletown, O., maker of the Merkel. He already has assumed his new duties and it is anticipated his wide acquaintance in the motorcycle industry and among the riders will result in a largely increased interest in the Merkel mount.

Frank L. Valiant, Assistant Advertising Manager for the Merkel.

Valiant is particularly well known because of his connection with the Emblem Manufacturing Company, Angola, N. Y., which concern he represented as a special agent in various sections of the East last year. He also rode Emblem machines in numerous racing and contest events, finishing with splendid credit to himself and his mount in many of them.

Energetic Club Organizers.

Among those who are engaged in securing the necessary riders to warrant the formation of a local club, and to which riders in their vicinity should apply for information, are the following: Kessler & Miller, Rochester, Ind.; A. M. Reynolds, 406 Smith street, Schenectady, N. Y.; A. J. Hall, 3741 West 25th street, Cleveland, O.; J. W. Warnken, 711 46th street, Milwaukee, Wis.; Will Last, 209 River street, Holland, Mich.; H. Pattison, box 506, Pontiac, Mich.; H. O. Stone, Newberry, S. C.; C. L. Cheshire, Lake City, Fla.

ATTENTION MOTORCYCLISTS

Immediate deliveries of 1912 Indians, any Model. Cash or installment. Full line of equipments and supplies, also clothing for the Motorcyclist.

B. A. SWENSON

298 Blackstone Street, Providence, R. I.

The F. N. Shaft-Drive Motorcycles

Single cylinder with two-speed gear and handle bar control of clutch.....$275.00
(The only machine in the world possessing this incomparable feature.)

Four cylinder ordinary automobile engine, compound spring fork, two powerful brakes, footrests if specified, combined luggage carrier and stand, long wheel base and large tires.....$350.00

AMERICAN F. N. COMPANY Boston, Mass.

Branches: 49 Union St., Prov., R. I. 415 Trumbull St., Hartford, Ct.

The following concerns have become incorporated recently to manufacture and deal in automobiles, accessories, etc.:

California Automobile Timetest Company, Los Angeles, Cal.; $100,000; incorporators, F. P. Carr, R. L. Bisby, E. B. Coll, Joseph H. Gosling and E. Kershner.

Great Eagle Motor Devices Company, Lindsborg, Kan.; $130,000; to manufacture and sell motor devices.

Standard Resilient Wheel Company, Inc., New York City; $500,000; incorporators, J. Gaynor, P. B. Verplanck, S. Jochelson.

D. G. Hutcheroft & Sons Company, Cleveland, O.; $10,000; incorporators, D. G. Hutchcroft, Glidden W. Hutchcroft, Thornton Hutchcroft, William Merts, S. H. Meacham.

Norman County Auto Company, Ada, Minn.; $50,000; president, Peter Matson; vice president, D. C. Lightborn; secretary, Louis Hintze; treasurer, C. J. Lofgren.

Dennis Motor Company, Toledo, O.; $25,000; incorporators, H. H. Dennis, C. W. Close, Allen E. Reid, R. S. Woodrow, John G. Meister.

Sutherland Automobile Air Appliance Company, Louisville, Ky.; $10,000; incorporators, M. M. Glavin, John W. Barns, T. R. Cartmell.

Omaha Motor Car Company, Augusta, Me.; $1,000,000; to manufacture and sell motor cars; incorporators, R. S. Buzzell, L. J. Coleman.

Chauffeurs Legal Association, Boston, Mass; $10,000; incorporators, Jay R. Benton, George A. Kearsley, Francis D. Harrigan.

Williams Auto Company, Boston, Mass.; $2500; directors, James F. Hanley, William T. Hanley, Fred W. Ryan.

Auto Tractor Company, Augusta, Me.; $100,000; incorporators, L. J. Coleman, R. S. Buzzell.

Worcester Automobile Parts Company, Worcester, Mass.; $10,000; incorporators, James N. Heald, Cyrus A. Cowan, John A. Doane.

Porto Rico Motor Company, Greenwich, Mass.; $150,000; officers, Loren J. Whiteside, Milton A. Mills.

Lyons Auto Company, Grand Forks, N. D.; $15,000; incorporators, J. W. Lyons, M. J. Lyons, M. M. Lyons.

Twin City Auto Company, Council Bluffs, Ia.; $25,000; incorporators, S. V. Barnhart, J. J. Klein, H. W. Neiman, M. C. Goodwin.

National Tire Company, $50,000; to manufacture automobile tires in New York City; incorporators, H. Davies, T. H. Hopkirk, I. V. Weisbrod.

Eadie Vehicle & Gear Company, Buffalo, N. Y.; $200,000; incorporators, John M. Eadie, George P. Keating, Seward H. Millener, William J. Donovan, Howard G. E. Smith.

Mitchell-Edmondston Garage, Inc., New York City; $10,000; incorporators, Liland A. Mitchell, George W. Edmonston, Joseph P. Bickerton.

Kingsbury-Leahy Company, Albany, N. Y.; $40,000; to deal in automobiles and motorcycles; incorporators, J. S. Kingsbury, S. M. Kingsbury, E. W. Leahy.

Pennsylvania Automobile Company, St. Louis, Mo.; $10,000; incorporators, William A. Fortner, Claude G. Fordran, George P. Burleigh.

Charter Automobile Company, Baltimore, Md.; $75,000; incorporators, C. R. Fouts, W. E. Byrd, G. H. Reinhardt.

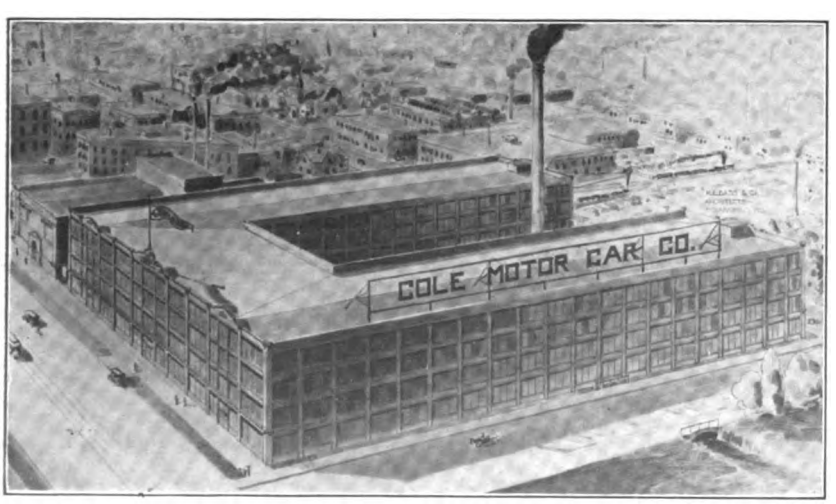
Pembroke Manufacturing Company, Rochester, N. Y.; $50,000; to deal in and manaufacture automobile parts and accessories; incorporators, Charles J. Pembroke, Winfield P. Pembroke, Walker J. Fellows.

Etchell Auto Company, Biddeford, Me.; $10,000; incorporators, Arthur L. Roberts, Joseph Etchells, Charles V. Tanner.

Wetherbee Bros. Company, Arlington, Mass.; $20,000; incorporators, Ivers L. Wetherbee, Clarence A. Wetherbee, A. Ingham Bicknell.

Punctureless Tire Company of Massachusetts, Boston, Mass.; $15,000; incorporators, William E. Riddell, J. Hiram Smith, Frank H. Jenkins.

New York & Boston Auto-Bus Company, Chelsea, Mass.; $20,000; to buy, sell, lease and operate motor vehicles; incorporators, Daniel O. Fillmore, Charles E. S. Moir, Lucy M. Fillmore.



Cut Price Automobile Supply Company, Boston, Mass.; $10,000; incorporators, I. J. Rothenberg, Louis S. Rothenberg, Henry L. Rothenberg.

Victoria Motor Car Company, Victoria, Tex.; $5000; incorporators, Welder Daniel, J. T. Linebaugh, W. S. Crain.

Buffalo Automobile Sales Company, Buffalo, N. Y.; $10,000; incorporators, R. A. Smith, C. A. Poppert, P. G. Buxby, Walter F. Titus, Henry W. Hill.

Capital Garage and Service Company, Washington, D. C.; $125,000; incorporated in Virginia by Lewis T. Cowie, Joseph B. Chapin and Eugene A. Jones.

B. & B. Manufacturing Company, Cleveland, O.; $35,000; to sell accessories and parts; incorporators, W. E. Smith, R. L. Bacher, W. R. Bauman, L. C. Heinberger, I. T. Quick.

As the New Cole Factory in Indianapolis Will Look When Completed—One Wing of This Is Now Finished.

Digitized by Google

Guide Motor Lamp Manufacturing Company, Cleveland, O.; $100,000; incorporators, H. J. Monson, W. F. Persons, W. H. Bunce, J. D. Kauffman, W. L. Rose.

Hampton Manufacturing Company, Indianapolis, Ind.; $5000; to manufacture accessories; incorporators, S. B. Nussbaum, Sol Allman, William Hampton.

GARAGE AND DEALER.

Superior Motor & Machine Company, Superior, Wis., has leased the Cary garage building on Tower avenue and will operate it in connection with the other garages of the concern. This move was made necessary by the rapid expansion of the business.

H. G. Raymond, Fort Wayne, Ind., agent for the Imperial and R-C-H, is having a new garage built at 718 Barr street. The building will contain 7680 feet of floor space, and will cost $12,000.

The Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, opened a new factory branch in San Francisco, Cal., recently. The new quarters are large, 50 by 150 feet, and the equipment of the branch is exceptionally complete.

Malcolm P. Burbank, 805 Main street, Worcester, Mass., has taken the local agency for Pullman cars, made by the Pullman Motor Car Company, York, Penn.

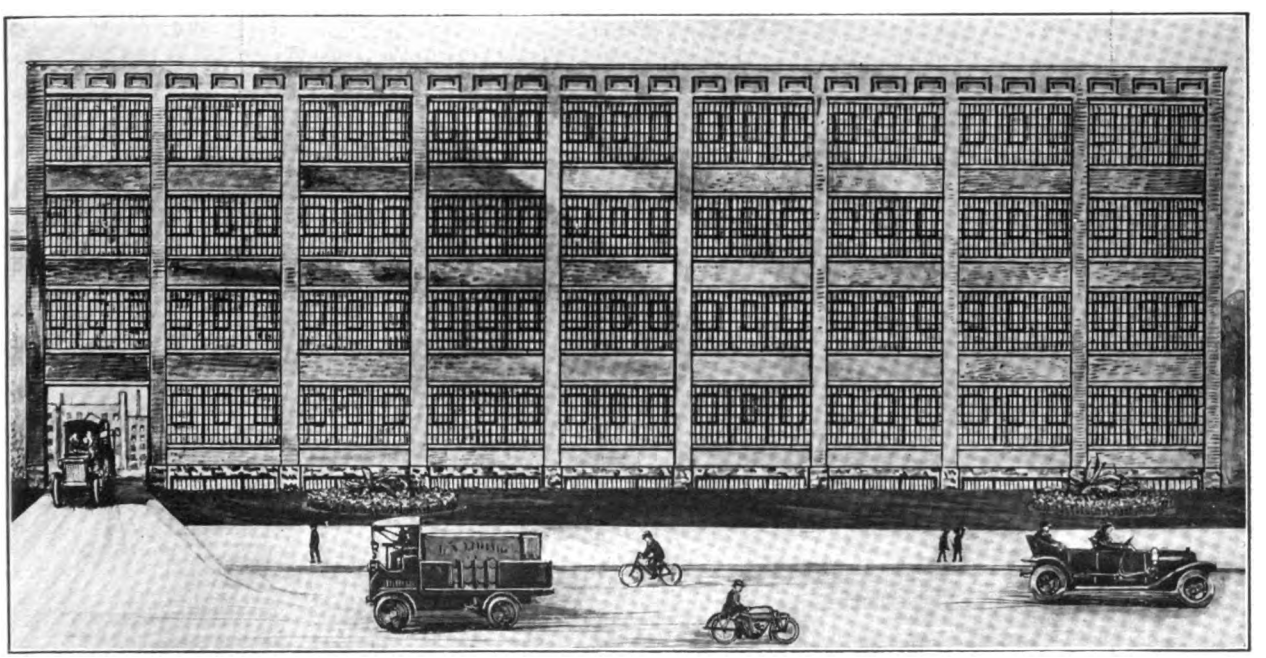
Dewey & Byrns, conducting the Island garage in Potsdam, N. Y., has just installed an 18-foot elevator, making the garage one of the most complete and up-to-date in the locality.

J. William O'Donnell, Jr., Lynn, Mass., has been appointed agent for the Morgan Motor Company, Worcester, Mass., and will handle Morgan trucks in Lynn. He is but 19 years old, and will be placed in charge of the only truck service station in the vicinity.

The Oklahoma Motor Car Company, Oklahoma City, Okla., has taken the agency for the R-C-H, made by the R-C-H Corporation, Detroit, and is carryilng a full line of cars.

The City Hall Garage, Lowell, Mass., has been bought by J. C. Evans and Carl W. Morteson of North Billerica, Arthur Beharrell, the former proprietor, having gone to the Boston office of the Velie.

The Cook & Stoddard Company, Washington, D. C., will remove into new quarters at 1138 Connecticut avenue, N. W., in the near future. The company handles Cadillac, Pierce-Arrow and Baker electric cars.



The R-C-H Motor Sales Company, Jackson, Mich., incorporated some time ago by F. C. and G. A. Weber, has opened salesrooms for the R-C-H cars at 304 Cooper street.

Ramsey's Auto Supply House was recently opened in Phoenix, Ariz., by J. R. Ramsey, representing the Western Rubber Supply Company of Los Angeles, Cal. A full line of automobile supplies will be carried, and a specialty will be made of vulcanizing.

Geo. R. Giroux has become manager of the Foraker Motor Truck Company, Chicago, Ill., handling Durable Dayton trucks, made by the Dayton Motor Truck Company, Dayton, O. Mr. Giroux formerly handled the Little Giant, produced by the Chicago Pneumatic Tool Company.

The Studebaker Automobile Company, Milwaukee, Wis., has moved into new quarters in the Stroh building, where a service department will be maintained in addition to show rooms for the E-M-F and Flanders. C. R. Dashiell, formerly local manager, has gone to the Chicago branch, and has been succeeded by L. P. Chittenden, who has been travelling in Wisconsin for the Studebaker organization.

Fred F. Folger, Watertown, N. Y., has purchased the garage of the Warner Automobile Company, and will succeed Mr. Warner, who, however, still retains the agency for Ford cars, made by the Ford Motor Company, Detroit. The garage has been improved and its equipment brought up-to-date.

The New Pope-Hartford Plant in Hartford, Conn., Which Will Double the Output of the Company.

The Selden Motor Car Company is to erect a $50,000 garage in Houston, Tex., on Clay avenue. The building will be three stories in height, thoroughly modern and strictly fire proof.

The Dwyer & Roche Company, Hartford, Conn., has taken the livery stable at 18 John street and is conducting an automobile painting and repair business. The building is centrally located, and contains 15,000 square feet of floor space.

The Vestal Motor Car Company, Pittsburg, Penn., has moved to new quarters at 5852-54 Baum street The new structure is large and will furnish space enough to take care of the company's needs for some time to come. Stevens-Duryea and Velie cars are handled.

A. J. Rogers of the sales department of the Remy Electric Company, Anderson, Ind., has gone to San Francisco to take charge of the branch there at 170 Golden Gate avenue. He is well known in the South and West, and will no doubt repeat his success in that territory.

LeHardy & Lindsay, Rochester, N. Y., agent for the Marmon, made by the Nordyke & Marmon Company, In-

Digitized by Google

dianapolis, have contracted for the property at 308-10 East avenue. The building will be altered and a show room and garage built.

R. B. Raynor, Fort Wayne, Ind., has secured the agency for the Cutting car, made by the Clarke-Carter Automobile Company, Jackson, Mich., and will operate under the firm name of the Cutting Sales Company, conducting a garage as well as salesrooms.

George Yon, Syracuse, N. Y., agent for the Abbott-Detroit, made by the Abbott Motor Company, Detroit, recently moved into a new garage at 1057 South Clinton street. The building is 40 by 110 feet, two stories high.

The Trenton Motor Car Company, Trenton, N. J., composed of Hugo Ufert and Oliver O. Moore, recently purchased Dorsett's Electric garage, at 111-113 Chancery street. Extensive alterations have been made, and the new concern carries a full line of parts and accessories.

The New England Auto & Supply Exchange, Bridgeport, Conn., has been organized by George W. Jackman, and a salesroom opened at 608 Main street, where a full line of supplies is carried.

The Pullman Motor Car Company, York, Penn., has opened salesrooms in Pittsburg, on South Highland avenue. The Auditorium building is to be remodeled at a cost of about $40,000 and will be used by the branch, which will be incorporated as the Pullman Auto Company of Pittsburg.

The Neustadt Automobile & Supply Company, St. Louis, Mo., has secured as department managers, Earl J. Hoffman, formerly with the Timken Roller Bearing Company, and Robert W. Maloney, an expert on automobile lighting.

The Goodyear Tire & Rubber Company's branch at Portland, Me., has moved to 646 Congress street. I. W. Penniman of the Boston branch has been appointed local manager.

C. E. Havens has been appointed manager of the service and technical departments of the Abbott Motor Company, Detroit, having left the Hudson Motor Car Company. Mr. Havens has had considerable experience in the factories, having been connected with the Thomas and Oldsmobile plants.

Dittrich Bros., Perth, Ont., has just completed a new garage, which it will operate in addition to its foundry and machine shop.

The Eastern Auto & Machine Company, Baltimore, Md., has awarded the contract for the erection of a garage on the Philadelphia road, on the outskirts of the city. The building will be 180 by 49 feet, of brick.

The Repass Automobile Company, Waterloo, Ia., a branch of the Herring Motor Car Company, Des Moines, has moved to new quarters, 217-19 West Fifth street, where they have ample room to display Ford cars, and to conduct a repair and service department. A total of 50,000 square feet of floor space is occupied by the company.

WITH THE MANUFACTURER.

The Bartholomew Automobile Company, Peoria, Ill., maker of Glide cars, has increased its capital stock to $350,000. The increase amounts to $150,000, the capital stock having been $200,000 previously.

The Krupp Motor Company, Pittsburg, Penn., has purchased 10 acres of ground near Beaver Falls, Penn., and is to start erection at once of buildings which will cost $300,000. The plans for the main building, as recently drawn up, call for a structure two stories high, 80 by 700 feet. Motors, pleasure cars and trucks will be manufactured, and about 200 men will be employed at first.

Hess & Son, Philadelphia, has moved to new and larger quarters at 666 North Broad street, where Tinol, the combined solder and flux, will be carried in stock.

The Simplex Automobile Company has leased for 15 years a plot of ground 100 by 200 feet in Long Island City, N. Y. A one-story building will be erected at a cost of $40,000. Other stories will be added when necessary, the foundations being planned with this in view.

Fred E. Bogart, who has been manager of the Hartford Auto Parts Company, Hartford, Conn., for several years, has retired.

George Weber has been appointed factory manager for the Metzger Motor Car Company, Detroit, and will look after the manufacture of Everitt cars. Mr. Weber is a man of considerable experience in the manufacturing end of the industry, having been with the Locomobile Company of America, Bridgeport, Conn.; the Waltham Manufacturing Company, Waltham, Mass., and the Buick Motor Company, Flint, Mich.

William C. Little has resigned his position with the General Motor Car Company, Philadelphia, and accepted the position of western travelling representative for the Lozier Motor Company, Detroit, representing the Lozier in the Missouri river and Rocky mountain territory.

The Pope Manufacturing Company, Hartford, Conn., maker of Pope-Hartford cars, is to erect a modern four-story building. It is expected that this will be completed and the output of the factory doubled by summer, or early fall at the latest. Specifications have been completed and bids invited, so that June should see the new factory well under way, when the postoffice sub-station will be moved to the Hart & Hegeman building and the space thus available occupied by the Pope superintendent, giving the factory some much needed room. The new building will be 192 by 72 feet, four stories and basement, and will add about 70,000 square feet to the plant. A tower outside the main walls of the addition will contain the elevators, stairways and toilets. The elevators will be two in number, and will each have a capacity of 10 tons, with platforms 25 feet long. The building will be light, large steel sash windows being a feature. An open 20-foot driveway will admit automobiles to the first floor.

The Metzger Motor Car Company, Detroit, has closed a deal with George Holm & Co., Helsingfors, Finland, giving it the agency for the Everitt cars in Finland and the northern part of Russia.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, recently took possession of the first wing of the new factory which is being erected for it in the heart of the manufacturing district, and work is being rushed on the other wing. The one just completed cost $100,000, is four stories high, of reinforced concrete, 100 by 160 feet. It stands in the rear of factory No. 1. The second wing will be a duplicate of the first, and when the factory is completed it will be U shaped, 230 by 315 feet. The construction will be such that two additional stories may be built at any time.

The Jeffrey Dewitt Company, Detroit, is building an addition to its factory which will shortly be completed. It will be two stories high, 100 by 40 feet and the increased space will enable the factory to turn out 36,000 spark plug porcelains a day, making a yearly capacity of 10,800,000. The company has bought the patents and rights to the Visible spark plug, and this will be manufactured and marketed as the J. D. Visible spark plug. It has a port or opening in the porcelain, containing an auxiliary spark gap.

Hal Smith has resigned his position as advertising manager for the Anderson Carriage Company, Detroit, and joined the advertising department of the electric truck division of the General Motors Company.

The Motor Distributing Company, Seattle, Wash., agent for the Lozier Motor Company, Detroit, is planning to spend $80,000 for a new home for the Lozier. A plot of ground has been bought for $50,000, and a $30,000 building is to be erected to house modern salesrooms and a garage and service department.

The Henry Motor Car Company's factory at Muskegon, Mich., was sold recently to E. Levens and George Fachfennaier of Philadelphia. The purchase includes all the cars and material at the factory, and it is reported that a company will be organized to supply the trade with spare parts for the Henry car.

Dyneto Electric Company is to move its plant from Elbridge, N. Y., to Syracuse, and negotiations are under way for obtaining a suitable factory.

The Olson Manufacturing Company has started work on its new factory in Sioux City, Ia., where it will manufacture valve truing and seating machinery. The factory will cost $5000, and will be 32 by 122 feet.

The Abbott Motor Company, Detroit, recently closed Abbott-Detroit agency contracts with the following: Victor Levesque, Montreal, Can.; Norwood Machine Company, Norwood, O.; Western Motor Car Company, Denver, Col.; R. J. Rhodes, Newport News, Va.; Reese Machine & Tool Works, Plymouth, Penn; Zanesville Taxicab Company, Zanesville, O.

The Pittsburg Chalmers Company, Pittsburg, Penn.; has bought a plot of land in Louisa street, where a $20,000 building, containing display, sales and repair rooms, will be erected.

Digitized by Google

THE INDUSTRY IN NEW YORK.

According to an advance bulletin on manufactures for the State of New York, based upon the 13th census, and issued by the Department of Commerce and Labor, the automobile industry in that commonwealth arose from 126th place in 1899 to 73rd in 1904 and 23rd in 1909. These figures show that the number of establishments engaged in the manufacture of automobiles, bodies and tops has increased from 15 to 113 in 10 years, and that the capital involved has been increased from $639,000 to $25,102,000. Of course, it must be remembered that these figures are now more than two years old, and many changes undoubtedly would be revealed were it possible to secure a similar report for 1911.

In the accompanying tabulation is presented the statistics for the entire state, and for the cities of Buffalo and New York. Automobiles are manufactured in several other cities, but the amount of business transacted does not appear to have warranted segregation in the report of the census board, and the figures are included in the item "All other industries." The compilation will be of interest to motorists, not only because it shows the growth of the motor car industry in New York, but as an indication of the growing importance of the manufacture of cars throughout the entire country. The tabulation follows:

State of New York.

	1899	1904	1909
No. of establishments	15	35	113
Persons engaged	..	2,101	11,610
Proprietors	..	21	59
Salaried employees	56	231	1,690
Wage earners	288	1,849	9,861
Primary horsepower	..	1,254	9,398
Capital involved	$639,000	$3,347,000	$25,102,000
Salaries paid	57,000	231,000	1,604,000
Wages paid	166,000	1,227,000	7,016,000
Cost of materials	173,000	1,907,000	14,908,000
Value of products	456,000	4,260,000	30,980,000
Value added by manufact'e	283,000	2,353,000	16,072,000

City of Buffalo.

	1899	1904	1909
No. of establishments	3	5	23
Persons engaged	..	679	3,640

Capital involved	$89,000	$1,422,000	$3,713,000
Salaries paid	.....	80,000	492,000
Wages paid	4,000	493,000	1,585,000
Cost of materials	3,000	757,000	2,636,000
Value of products	9,000	1,399,000	6,194,000
Value added by manufact'e	6,000	642,000	3,558,000

AUTOS AT MICHIGAN STATE FAIR.

Special provisions are to be made to accommodate visiting motorists at the Michigan state fair to be held in Detroit in the fall, as well as for exhibits of automobile manufacturers. The building which was specially constructed for motor car shows in 1910 will be used, affording 52,000 square feet for the exhibitors. A special entrance will be made in the park for both pedestrians and machines, making the automobile building easily accessible.

MORRIS GRABOWSKY RESIGNS.

According to a dispatch from Detroit, Morris Grabowsky of the Alden Sampson Company, which is a constituent of the United States Motor Company, has resigned, the resignation taking effect May 1. Mr. Grabowsky had been with the Sampson since the factory was purchased by the selling company, and previously had been identified with the Rapid Motor Vehicle Company, Pontiac, Mich. He has not made known his plans for the future.

MISSOURI'S CENSUS FIGURES.

While Missouri may not be classed as one of the most important automobile producing centres of the country, the report of the census bureau with reference to its findings during the 13th census shows that the number of factories in the state producing automobiles, bodies and parts, increased from three in 1904 to 17 in 1909. The total value of products increased from $63,000 to $1,677,000 during the same period. The statistics for the state and the city of St. Louis follow:

State of Missouri.

	1904	1909
Number of establishments	3	17
Persons engaged	37	449
Proprietors	3	6
Salaried employees	13	75
Wage earners	21	368
Primary horsepower	20	184
Capital involved	$24,000	$800,000
Salaries paid	5,000	85,000
Wages paid	16,000	252,000
Cost of materials	31,000	1,025,000
Value of products	63,000	1,677,000
Value added by manufacture	32,000	652,000

City of St. Louis.

	1904	1909
Number of establishments	3	11
Persons engaged	37	340
Proprietors	3	2
Salaried employees	13	56
Wage earners	21	282
Primary horsepower	..	139
Capital involved	$24,000	$620,000
Salaries paid	5,000	62,000
Wages paid	16,000	197,000
Cost of materials	31,000	727,000
Value of products	63,000	1,302,000
Value added by manufacture	32,000	575,000

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

CHANGES IN CONTEST RULES FOR 1912.

WHILE completed rules governing automobile contests for 1912 have not been prepared for distribution by the contest board of the American Automobile Association, advance information concerning the more important changes is now available. These amendments have been adopted with a view to securing greater safety to both spectators and contestants, and for the purpose of clearing up differences which have arisen from situations developed in the past. They may be summarized as follows:

The definition of "Contest" has been so modified as to indicate clearly what motor car events should be sanctioned by the A. A. A. and now reads: "Contest—Any competition of two or more motor cars, governed by rules, in which entry fees may or may not be charged, or prizes may or may not be offered, or in which speed or durability are determining factors in evolving a winner."

The definition of "Automobile, Motor Car or Car," has been changed to include three-wheeled vehicles.

The minimum weights heretofore prescribed in stock chassis events have been eliminated and stock chassis contests will be governed by piston displacement as in class C events.

No car or chassis competing in events held under price or piston displacement classifications is eligible for any division except that to which its price or piston displacement entitles it.

Sanction fees remain unchanged, except that a fee of $1000 is provided for events of 100 miles or more, held on specially constructed speedways, such as the Indianapolis motor speedway, the Los Angeles motordrome, etc.

To rule 17, which reads: "'Reserved territory—No sanction shall be granted to any promoters to hold a contest in the territory of an affiliated club, until the contest board has conferred with such club," has been added: "Any objections which an affiliated club may file against the promotion of any contest in its territory must be supported by bona fide reasons for such objections."

The following new rule has been incorporated: "Rule 17A—No sanction shall be granted to any club, association or individual for any contest other than one to be promoted and conducted by it. Any misrepresentation or transfer of sanction to a second party for a consideration shall invalidate the sanction and render the club, association or individual liable to disqualification and ineligible for further sanctions.'

Registry cards will no longer be issued to drivers in reliability contests, but such drivers will be required to register with the referee for each reliability run prior to the start on a form specially prepared. No registration fee will be required and such registration applies only to that particular event.

With respect to drivers and mechanicians the new rules provide that mechanicians must be carried in all road races and in all events of 50 miles or more held on beach, speedway or track. No driver or mechanician under 21 years of age will be permitted to participate in sanctioned events, and no person under 21 years of age will be appointed to any official position.

To rule 110 on the "Change of Crew" of a car the following has been added: "Should the mechanician leave his seat for any reason whatsoever at any time during the race, the driver must not continue until the mechanician is again seated in the car. In case of disability or accident to the mechanician which may necessitate his leaving the car, the driver may, after stopping and investigating, proceed alone to the pits and make application to the referee for instructions."

The powers of the official referee have been enlarged somewhat, as will be noted by these two new rules:

"He shall have the right to terminate a race before its scheduled finish, if emergency demands such action, and in such case no award shall be made.

"He shall have the right to temporarily stop or delay a race in case of impending disaster. Upon signal to stop, the cars must line up in front of their pits (or in the paddock) and during the time the race is discontinued they shall be in charge of members of the technical committee and no work of any kind shall be done upon them."

The deposit prescribed to accompany written protests filed with the referee, heretofore $10 in all cases except reliability tours, has been raised to $25 for all events, and it is hoped that this will result in a decrease in the number of frivolous protests.

The use of flags to signal contestants in track and road races has been made uniform and the various signals now are: "Red flag, course is clear; yellow, blocked course, stop; green, you are entering your last lap; white, stop at pit on next lap for consultation; black and white checkered, you are finished; black with white centre, a competitor is trying to overtake you (Road judge's flag for use on narrow stretches of course)."

In stock car or chassis events the use of detachable or demountable wheels which do not involve the change of wheel bearings or that portion of the hub carrying the bearings is not permitted except such wheels are regularly supplied as stock equipment. In non-stock events, such demountable wheels are permitted on the same basis as the use of detachable or demountable rim equipment.

Considerable time and thought have been devoted to the matter of taking proper measures for the protection of spectators and competitors, with the following result:

"Rule 203. Fences—Fences should be of such nature as not to endanger the lives of drivers and

Digitized by Google

mechanicians of competing cars. The pole or top rail of fences at the inner and outer edges of the track on curves must be removed, starting at a point where the curve begins and continuing to a point 25 feet beyond where the curve ends, measured in the direction in which races are run; i. e., with the left hand of the driver toward the inner fence.

"Neutral Zones—Neutral zones must be established and maintained during the running of races. These zones should be 40 feet in width on the inner and outer curves opposite where the pole or top rail of the fences is removed, as required by the foregoing rule, and 30 feet in width on the straightways.

"Rule 204. Ditches, Holes or Obstacles—Ditches, holes or obstacles must not be permitted on the track between the inner and outer fences.

"Rule 205. Anti-Dust—Adequate measures must be taken for the prevention of dust on the track. The use of water is not permitted, and dust must be laid by oils, calcium chloride or other similar preparation approved by the contest board.

"Rule 206. Official sanction for track events is issued conditional upon a strict compliance with the above rules, and sanction shall be revoked in case of failure to meet each and every one of these requirements."

Handicap events will be timed hereafter from the start of the "limit" man or first competitor away from the line. The number of starters in a track race is limited to one car for every 400 feet of track. This will permit 13 starters in a race held on a one-mile track, and seven on a half-mile track. Starting positions are to be assigned in the order in which competing cars are presented to the starter, unless otherwise specifically arranged, and there must be four feet between the hubs of contesting cars.

In the matter of touring events, in which other than registered stock cars may be entered, these can be run under class E and the conditions of grades III and IV. In case of tied scores, winners are to be decided by lot. Reliability contests of grades I and II shall be open only to registered stock cars, whereas contests of grades III and IV may be restricted to registered stock cars or open to any car privately owned or otherwise, regardless of registration.

The following addition has been made to rule 425, fourth paragraph: "Where dash adjustment for needle valves or auxiliary air valves on carburetor are furnished as standard equipment by the manufacturer, same may be used without penalty."

DETROIT TO CELEBRATE.

Detroit will hold a grand celebration during the week of July 22, when the 211th anniversary of the founding of the city will be observed. The affair is named the "Cadillaqua," which title is a combination of the name of the man who founded the city, Cadillac, and aqua, the Latin for water. Water sports will be a feature of the week, but there will also be automobile races and aeroplane flights. It is expected that the motoring fraternity of the country, especially of the West, will make Detroit a mecca during the Cadillaqua.

NEW DURYEA ELECTA.

C. E. Duryea, the well known veteran of the automobile trade, appears to be quite well settled in Saginaw, Mich., after his removal from Reading, Penn., and under the firm name of the C. E. Duryea Company, has just produced a new model of his Electa. This is even simpler than its predecessor. A decided novelty of the construction is the chassis frame, which is triangular, instead of rectangular. By this means three point suspension of both the motor and body is attained. The characteristic Duryea motor is used, with the flywheel between the two cylinders and the crankshaft serving as the driving axle. The transmission has been strengthened, and the muffler enlarged.

LIABLE FOR CHECKED CAR.

A decision of interest to motorists was recently given in the second district municipal court of Brooklyn, N. Y., in the suit of Dr. A. S. Brinkerhof for damages to his car while checked at a Coney Island cafe. Clifford Brinkerhof, son of the doctor, checked the car with an attendant outside of Feltman's cafe, Coney Island, from which it was stolen, being found subsequently with all the removable parts missing and considerably damaged by being run into a ditch. Feltman Bros., the cafe proprietors, refused to acknowledge any responsibility in the matter, stating that the checking stand was maintained independently.

Testimony showed, however, that the checking space was in charge of an attendant in the Feltman uniform, and that the numbered ticket which was issued for the car bore Feltman's name. The fact that the checking system was maintained only for the convenience of the patrons of the cafe, without any fee being charged, had no influence on the verdict, which was for the highest sum the court could award, $500.

ENTER THE "BITE."

In the current number of Juice, published by the Pettingell-Andrews Company, Boston, Mass., manufacturer of electrical supplies and fittings, a decidedly new term is introduced. This is the "bite" which is used to signify the electrician's helper, the raw material for future electrical engineers, much in the same manner as reference is made to the printer's devil. The origin of the name is somewhat shrouded in mystery, but is said to have become rather popular among electricians.

Universal lighting means the safe use of public ways at night. It need not inflict unreasonable restrictions on anyone. Why not follow Massachusetts' example?

Digitized by Google

UNITED STATES TIRES ABROAD.

Although Europe has been producing automobile tires for a number of years, it is said that the rubber tread type of non-skid pneumatic, so prevalent in this country, is practically unknown there except as it has been introduced by American tourists. That there is a demand for these tires abroad is made evident by the interest that European dealers are manifesting in them.

Recently, M. Adler of Amsterdam, Holland, came to America for the purpose of investigating the tire field, and as a result of his visit he has taken the agency for United States tires, including the Nobby treads, made by the United States Tire Company, New York City. He represents one of the largest supply stores in Europe, maintaining branches at Brussels, Paris and Birmingham, England.

In purchasing tires in this country, Mr. Adler absolutely disregarded the question of price. He admitted that American shoes cost more than the European product, but explained that the difference in price can be more than offset by the difference in service. In spite of the fact that Continental highways are noted for being good, it is said that foreign tires have not been giving anywhere near the mileage obtained by motorists in this country, under decidedly less favorable road conditions.

NEW ROAD GUIDE SYSTEM.

A system based on a somewhat novel plan is being advocated by A. L. Bancroft of Concord, Cal., for the numbering of farm houses, roads and routes. The idea is to lay off every road into blocks of one-tenth of a mile each and designate the houses by letters placed to the right or left of the block number according to whether the houses are on the right or left side of the road. The system, if thoroughly carried out and the roads posted with their numbers, would no doubt be of value to the tourist.

THE TRAIL BLAZER.

Among the new house organs is the Trail Blazer, the first number of which recently appeared from the offices of the Findeisen & Kropf Manufacturing Company, Chicago, Ill. It is an interesting little publication, devoted to the interests of the Rayfield carburetor, made by this concern.

THE FIRST MAGNETO.

According to C. F. Splitdorf of New York City, the first magneto appeared in Germany in 1886 and was of the low-tension type. It was used for ignition on stationary engines and was later perfected for use on road vehicles.

CANADIAN OVERLAND TRADE MARK.

G. R. Rastall of Regina, Sask., some time ago incorporated the Overland Automobile Company of Canada, Ltd., and is said to have claimed partnership with President John N. Willys of the Willys-Overland Company, Toledo, O. The name Overland was registered as a trade mark, and preparations were made to build Overland cars in Canada. All this came as a surprise to Willys who had never heard of Rastall except as being one of the Overland's Canadian agents, and he immediately instituted suit for damages. As a result the name of the company has been changed to the Canadian Motors, and the trade mark Overland surrendered to the government.

NATIONALS ON STAGE ROUTES.

C. P. Barnard of Roseburg, Ore., operating the stage line between Roseburg and Myrtle Point, has bought two Nationals and four Buicks for use in carrying mail and passengers. The Nationals will be used for the heavier work, and will carry both passengers and mail, Barnard figuring on loading 1500 pounds of mail and three passengers on each car. The Buicks will be used for passengers exclusively, and special bodies are being built for them. The number of horses which the automobiles will eliminate is as yet a matter of conjecture, but no doubt the present stable of 84 will be considerably reduced. Barnard estimates that the two National cars will eliminate 32 horses at least. The trial of the automobiles is attracting attention among the stage men of the coast, and it will be watched with considerable interest.

OHIO TO BUILD CANADIAN PLANT.

The Ohio Motor Car Company of Cincinnati, O., is to build a plant in Canada at Colborne, Ont., near Toronto, for the production of Ohio gasoline cars. A Canadian company is to be incorporated with a capital of $400,000, and work on the factory is to be started at once. The offices will be located in Toronto, and C. F. Pratt, the president of the parent concern, will take an active part in the management of the new venture.

UNITED STATES TIRE BRANCHES.

The United States Tire Company, New York City, in line with its policy of establishing branches in all parts of the country, has opened branch houses in Jacksonville, Fla.; Richmond, Va., and Des Moines, Ia.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

Why Not Change Places With Your Customers On This Tire Question?

It might be a good thing for tire dealers to get on the other side of the counter once in a while and look at things from the viewpoint of the customer.

If you were buying tires instead of selling, what tires would you buy?

The ones that offered you the greatest tire value for the money, wouldn't you? And you undoubtedly would let the number of strong points incorporated in the tire determine its value.

When you found a tire that "stood up"—gave you a service return for every penny of your investment—you probably would tell your neighbor that your dealer sold Good tires. And your dealer would get another customer and his business would grow accordingly.

Why not sell the kind of tires you would buy if you were a customer—

UNITED STATES TIRES

They are the product of a four-fold system of manufacture.
They combine the strong points of Four world-famous brands of tires.
They are the Strongest Tires in the World.
Why not handle them?

Dealers Everywhere.
No Goods at Retail.

THE A B C OF INTERNAL COMBUSTION ENGINE Maintenance and Repair

By VICTOR W. PAGE, M. E.

Will prove almost Indispensable to the } OWNER, OPERATOR, DEALER, BUILDER, SALESMAN or REPAIRMAN

Of Motor Cars, Power Boats or Motorcycles

It contains more *PRACTICAL* information than any three dollar book published. **Has Over 50 Illustrations, and the 8 Full Page Charts** dealing with systematic location of trouble are worth many times the price of the book.

A treatise which will assist those who know as well as the layman. An ideal work for the busy man, and while all superfluous matter is eliminated, it is practically an encyclopedia that *FITS THE POCKET*. Just off the press, it really fills the demand that has existed for a

SIMPLE, PRACTICAL AND COMPREHENSIVE WORK OF REFERENCE, that will be UP TO DATE

THE MOTOR TRUCK
A National Motoring Magazine Devoted Exclusively to the Commercial Field
12 ISSUES $1.00 THE YEAR

Tens of thousands of car owners in Europe have proved by thorough experience that a pair of

"J. M."
Shock Absorbers

on the rear springs produce utmost comfort at high speeds, *increase* engine efficiency, and *reduce* tire expense.

Why?

ALMOST UNIVERSALLY USED IN FRANCE
—
THE RAGE IN ENGLAND

Because the "J. M." Shock Absorber is an unique, perfect supplement to the rear springs of the car, which makes the rear wheels hold the ground so perfectly, despite rocks, ruts and car tracks, that there is an increased continuance of traction otherwise impossible.

Because of the thorough manner in which the "J. M." holds the rear wheels to the road, avoids the "racing" of your engine when the weight is taken off the rear, or driving wheels—and eliminates absolutely the tire grinding and engine shocks which result from the rear wheels jumping the ground one instant and hitting it with a thud the next.

Because the springs that compose the "J. M." are so scientifically planned and constructed that they absorb the 20 to 30 vibrations per second which is required for high speeds on rough roads—producing comfort that is possible by no other means.

Do not confuse the "J. M." with rotary friction shock absorbers. Before you equip your car, investigate—find out how the "J. M." is different, why the "J. M." is superior.

Made in three models—attachable in an hour, detachable in a quarter hour. **Prices, $35.00 to $50.00 per set.**

Learn at our expense

how to get the maximum comfort and service from your car. You can try the "J. M." without paying a cent till it proves our claims. Write on your business letterhead, referring to this publication, for booklet D, and full information on our special offer. Mention the name, model, weight and width of rear springs of the car you run.

The sales in your Accessories Department will take a big jump upward the day you make known the fact that you are handling the

TUTO HORN

A Two-Tone Electric Horn

The TUTO is the best selling horn on the market. The TUTO sales idea is a proposition you should investigate. It means more dollars in your cash register.

Through our advertising we send customers to your store with TUTO coupons. These entitle the holder to a ten days' free trial of a TUTO Horn. When the coupons are presented you honor them. The trials sell the horns, and you pocket your profits.

There is no chance for a loss. One dealer made $500.00 in three weeks honoring TUTO coupons. You have no dead stock on your shelves because we help you sell the horns.

You get good round profit on every sale, for we do not honor coupons direct. We give you a window sign and advertising and cut service to help you in your sales.

It is only a case of work together, pull together and share together. Say the word and we will send you our selling plan in detail, together with dealer's terms.

Don't let the other fellow get ahead of you, but write today.

NEW TYR

a waterproof
tire dressing
that beautifies
the car and preserves

THE TIRES

Far superior to any other preparation on the market for the two-fold purpose of dressing and preserving tires. A rubberized liquid preparation that fills the cracks and holes, prevents sand blisters and keeps the rubber from cracking. New Tyr can also be used on running boards and floor of car if desired with a very dressy effect. Uninjured by temperature or weather—water has no effect upon it. NEW TYR stays put and is applied in the same manner as paint.

Try a pint can of NEW TYR—it means a better looking car and better tires, covers more surface and is far superior to any other preparation on the market. Used in Germany and European motoring countries for years.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

May 10, 1912

BELOW you will see listed the correct grade of oil for 111 makes of automobiles—for both Summer and Winter. Space limits the list of cars. On request we will supply our more complete list with recommendations. Gargoyle Mobiloils are put up in barrels, half-barrels, in 5 and 1 gallon sealed, white cans. All are branded with the Gargoyle, which is our mark of manufacture. The various grades go by the following names:

Gargoyle Mobiloil "A." Gargoyle Mobiloil "B." Gargoyle Mobiloil "D." Gargoyle Mobiloil "E." Gargoyle Mobiloil "Arctic."

They are handled by the higher class garages, auto-supply stores and others who supply lubricants.

A guide to correct Automobile lubrication

Explanation: In the schedule, the letter opposite the car indicates the grade of Gargoyle Mobiloil that should be used. For example, "A" means "Gargoyle Mobiloil A." "Arc" means "Gargoyle Mobiloil Arctic." For all electric vehicles use Gargoyle Mobiloil A. The recommendations cover both pleasure and commercial vehicles unless otherwise noted.

1912 Annual Catalog No. 22

Our 1912 Catalog, the Largest and Most Complete Catalog of the kind, containing 256 Pages, is Now Ready for Distribution. The Circulation is Limited to ONE HUNDRED THOUSAND Copies. It will be mailed to any one on request.

CUT PRICES

Concerns that offer Large Discounts make it their practice to INFLATE LIST PRICES and then offer Large Discounts, which are somewhat misleading. We have seen a catalog in which a certain spark plug is illustrated, "PRICE $2.50, OUR PRICE $1.00," while THE STANDARD LIST or RETAIL PRICE for the same spark plug as illustrated in Our Catalog and advertised by the manufacturer is $1.00 each. Their CUT PRICE Therefore Is Not Lower Than OUR LIST PRICE.

DON'T BE DECEIVED BY LARGE DISCOUNTS QUOTED FROM INFLATED LIST PRICES . . . .

5-Passenger Touring Car, 110-Inch Wheelbase

R-C-H "Twenty-five"

5-Passenger Touring Car—110 Inch Wheelbase.

Standard Model

$850 F. O. B. DETROIT

Fully equipped with top, windshield, generator, side curtains, 5 lamps, horn, tools and tire repair kit, long stroke motor, 3 speeds, enclosed valves, Bosch magneto.

Model E E

$900 F. O. B. DETROIT

Equipped with 32x3 1-2 tires, demountable and quick detachable rims, extra rim, Bosch magneto, gas tank, windshield, lamps, horn, tools and kit, and the famous Jiffy Curtains, which can be adjusted in an instant and make the car entirely weather proof, long stroke motor, three speeds, enclosed valves.

General R-C-H Specifications

Motor—4 cylinders, cast en bloc—3 1-4 inch bore, 5-inch stroke. Two bearing crank shaft. Timing gears and valves enclosed. Three-point suspension. **Drive**—Left side. Irreversible worm gear, 16-inch wheel. **Control**—Center lever operated through H plate, integral with universal joint housing just below. **Springs**—Front, semi-elliptic; rear, full elliptic and mounted on swivel seats. **Frame**—Pressed steel channel. **Axles**—Front, I-beam, drop-forged; rear, semi-floating type. **Body**—English type, extra wide seats. **Wheelbase**—110 inches. Full equipment quoted above.

Wanted---1000 Dealers

Our selling problem this season has been a peculiar one. Naturally, our original aim was to get as wide a distribution as possible. But the demand for the R-C-H so far exceeded all expectations that our entire output for 1912 was speedily oversold. And this left many sections without R-C-H representation, simply because we could not supply the cars.

We shall manufacture this season in round numbers 10,000 cars. For the season of 1913 our output will be increased to 30,000 cars. Our present dealers tell us that they will take care of 15,000. That leaves 15,000 for sections where the R-C-H is not at present represented. And that in turn offers a golden opportunity to the right dealer in much of the best territory in the country.

Ask yourself these questions: What does your public—the people to whom you must sell—demand in a car? And given two cars possessing all these features, would the average man prefer to pay a lower or higher price?

Of course the answer to the second question is self-evident. So let us consider the first. The average man wants in a car five things—sturdiness, comfort, beauty, power, roadability. We claim that no car at twice its price excels the R-C-H in these essentials.

This advertisement may seem a trifle premature. But we want ample time to consider carefully every application made to us. We want the *best* dealers—men who will stay with the proposition year in and year out; men who will take the same pride that we do in the R-C-H watchwords of good work, good value and good will; men who will put as much care into selling the R-C-H as we do into making it.

So write us today; tell us about yourself.

R-C-H Service Stations

R-C-H service and supply stations in all large centers will be a feature of our 1912-13 policy. Many of them are already in operation—a photograph of one is shown below. Others will be established as rapidly as possible; so that no R-C-H owner anywhere will be far from a base as well equipped to attend to his wants as the factory itself. In California or Maine, Minnesota or Texas the R-C-H owner will be able to obtain repair parts within 24 hours.

FISK

TIRES

The FISK HEAVY CAR TYPE Tire is made in every style, *to fit any rim.* All Fisk Tires are identical in construction and quality. FISK PURE PARA TUBES have a lasting quality and superlative element of economy that *cannot* be found in *any compounded tube.*

Send for Description of our Two New Anti-Skid Treads—the Bailey Tread—that has more buttons than any other on the market, and the Fisk Town Car Tread, an effective tread with an attractively substantial appearance that speaks for its non-skidding qualities.

BAILEY TREAD TOWN CAR TREAD

IF YOU ARE READY to select a new Tire Equipment it is worth while to do a bit of first hand investigating.

Read the claims that Tire Manufacturers may put forth for individual makes; then put aside for future reference special records, selected testimonials and broad statements. Find out from personal inquiry among many users what the actual every-day and present-day results are from any given make of tire.

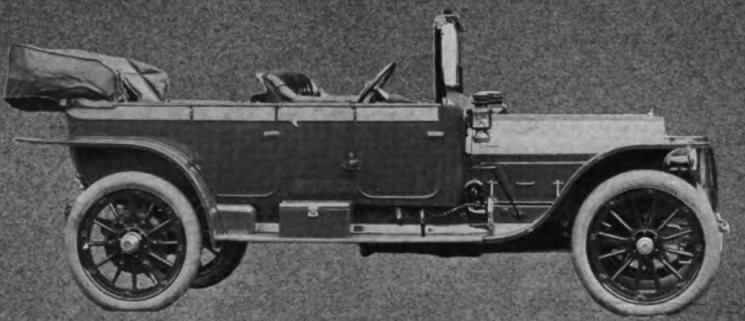
We rest our case on the verdict of our customers—anywhere and everywhere—including thousands whose names we have never heard and will never know.

We do this because our records show that it is safe for us to take this stand.

It is the percentage of tires that the manufacturer never hears of after they leave the factory that determines the real strength or weakness of any product.

FISK SERVICE MEANS *mileage*, *direct representation* in all large cities, *distribution* through the most reliable dealers and an *honest interest* that every tire that leaves the Fisk factory shall give its maximum value to the purchaser.

The Fisk Rubber Company



811-813 Boylston Street, Boston.

17 1-2 Dorrance St., Providence. **Factory: Chicopee Falls, Mass.**

You Don't Have to Pay It

Your part of the cost of monumental railway terminals is never *felt*—because so very *many* people use the railway. Only roads whose passenger traffic is *tremendous* can *afford* to give you palatial stations. On a smaller volume of business it couldn't be done — without charging you *double* for your railway tickets.

The Stewart volume of business is enormous. Stewart speedometers are on four cars out of five. The Stewart is the best that can be made, and it's sold at a minimum price. *Other* makers can't supply a comparable instrument at double the price.

The Stewart is a perfect speed and distance measure. A beauty in appearance and a marvel in accuracy.

With Stewart Speedometers on four cars out of five, others *have* to charge more just to keep alive.

Magnetic principle — jewel bearings — wearing parts hardened and polished; open dial, large figures, easily read; absolutely accurate; 100,000-mile season odometer, 100-mile trip register, can be reset to any tenth of a mile. Guaranteed for five years. Strongest flexible shaft, drop forged swivel joint, noiseless gears.

"ALWAYS ON THE JOB"

Speedometers, $15 to $30
Rim Wind Clock Combinations, $45 to $70

Simplicity in Lighting Systems

THE DYNALUX LIGHTING SYSTEM GIVES AN ABUNDANCE OF LIGHT WITH EXTREME SIMPLICITY

DYNAMO LIGHTING SYSTEMS, even with complications, are far superior to other methods of illumination for motor cars.

The Dynalux Dynamo Lighting System avoids complications and eliminates all chances for trouble in circuits, connections and regulation. It consists of only one working element, the Dynalux Dynamo, with its two wires extending to the lighting storage battery terminals. The battery and electrical wiring of the car can be any standard layout such as is provided when a plain battery system is used. It is the ideal system for the car owner, as it gives an abundance of light without requiring constant attention and supervision.

The Dynalux has been pronounced by leading engineers as the best dynamo system made; size, weight, simplicity and reliability considered.

The Dynalux generator is 8 5-8" long by 5 1-8" in diameter---weighs only 17 3-4 lbs. (less pulley) and delivers from ten to twelve amperes at 6 1-2 volts---sufficient for all lamps, battery ignition, electric horns, etc.---runs on noiseless annular ball bearings---all working parts and circuit connections enclosed and protected from mechanical and electrical injury---furnishes light and charges battery at slow city speeds of car---only two wires extending from Dynalux to battery and these connected to battery without regard to polarity---no chance for injuring battery or dynamo by wrong connections---automatic cut-in located inside of dynamo casing and the absence of outside regulators and meters make the system simple to install and without chance to go wrong---the car is not littered up with miscellaneous trappings---the Dynalux is positively driven at all speeds excepting when the engine is racing---then a simple declutching device in the pulley disconnects the armature so that the latter is not subject to destructive speeds---this gives the Dynalux the advantage of the slow speed type of dynamo with the light weight and compactness of the high speed machines---the Dynalux always retains its original strength and never requires overhauling or re-magnetizing as there are no permanent magnets in its construction---requires no more care than a high grade magneto---will outlast any motor car on which it is installed.

The cost of the Dynalux, complete with 100 ampere hour battery and driving pulley is **$125.00.** Without batteries the cost is **$95.00.**

Specify the DYNALUX on your new car.

Our Profit 8½ Per Cent

No-Rim-Cut Tires
10% Oversize

We want users to know—in an adequate way—what they get in the Goodyear No-Rim-Cut tire.

Perhaps the best way to give you a basis of value is to state our percentage of profit.

So we now announce what per cent of our price goes into what you get.

No-Rim-Cut tires now far outsell any other tire in existence.

So our output is the largest. Our equipment is modern. No concern in America can build good tires for less than we build them here.

With all these advantages our last year's profit averaged almost exactly 8½ per cent.

That was the profit in this risky business, with fluctuating materials, on a tire that's guaranteed.

It is the smallest margin on which a business of this kind can ever be conducted.

So you get in this tire as much for your money as a tire maker ever can give.

When other men claim to give better tires for the money—or equal tires for less money—remember this basic fact.

In No-Rim-Cut tires you get tires which can't rim-cut.

You get tires ten per cent over rated size.

You get the final result of our 13 years spent in perfecting tires.

And you get all this at a profit to us of 8½ per cent.

If you consider that fair—if you think it the limit—insist on these premier tires.

Our 1912 Tire Book—based on 13 years of tire making—is filled with facts you should know. Ask us to mail it to you.

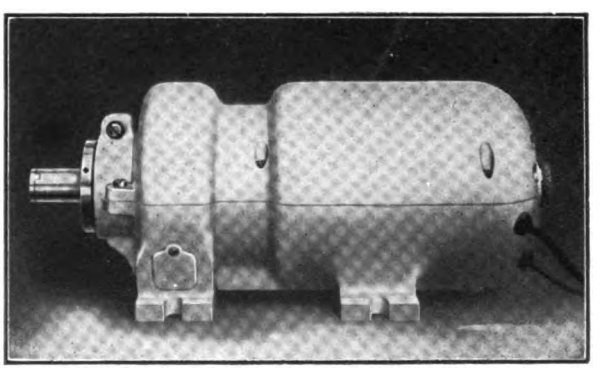
You can judge a car by its lighting equipment.

For example:—The GRAY & DAVIS Lighting Dynamo is not a "cheap" system. It is built as substantially as any of the big dynamos that light your home or office.



It is not a mere "battery charger." It is beautifully constructed—and costs the car manufacturer more than he has to pay for ordinary systems.

If a car is equipped with GRAY & DAVIS Dynamo and Electric Lamps—with the best—it's a safe bet that the rest of the car contains material and workmanship of the same high quality.

One can buy a GRAY & DAVIS equipped car without investigation. No sales argument is necessary because actual proof of quality is apparent.

Cars equipped with GRAY & DAVIS Dynamo and Lamps are good cars to buy. See that this equipment is on the automobile you intend purchasing.

Our catalog is free. Why not send for it and get posted on high class electrical equipment?

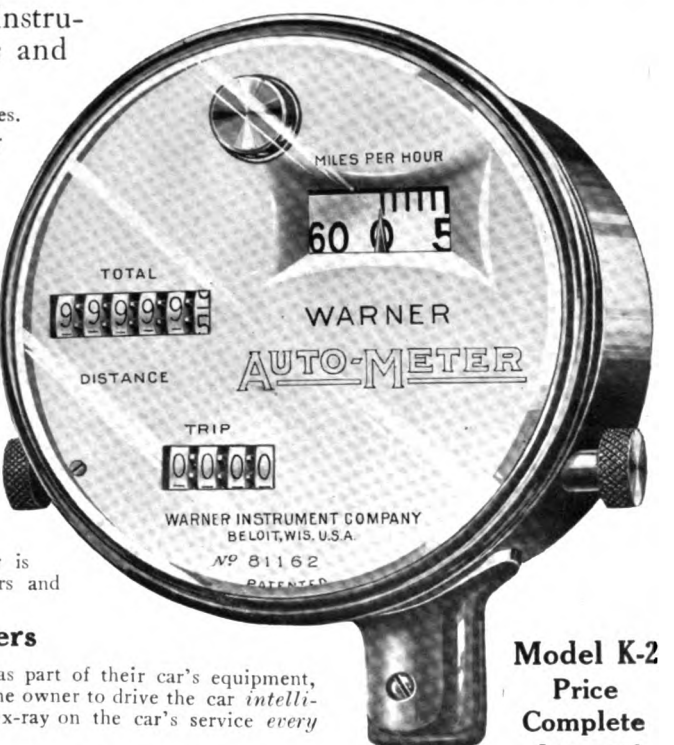
More Jewelers Than Blacksmiths Work on the Warner Auto-Meter

For the Warner is a *jeweled* instrument. It is the product of *jewelers* and experienced instrument makers.

It is built with more care than many watches.

For it must *do* more than any watch ever built.

It must possess Waltham *exactness*, Elgin *sensitiveness*, Howard *dependability*, yet be able to endure the persistent cruelty of severe vibration at all times, in all weather, in frigid or torrid temperature. It must possess, above all, Warner *endurance*.



Some watches are sold at retail for four dollars. There is a certain market for these watches.

But there is a *greater* market for *high quality* watches since the advent of the cheaper tickers.

The *high* quality watches win by *contrast*, by *comparison*.

More quality Warners have been sold this year because 1912 is a *quality* year.

By comparison and contrast the Warner is chosen by far-sighted car manufacturers, dealers and owners.

Automobile Manufacturers

are *glad* to *pay* for quality because the Warner, as part of their car's equipment, helps to give the car class and distinction—allows the owner to drive the car *intelligently*—to *know* what the car is *doing*—to put the x-ray on the car's service *every minute*.

Such a manufacturer *must* be far-sighted to do this. He *must* be figuring on the owner's *lasting* satisfaction.

For the Warner is built to *last*. It is about as hard to figure the duration of Warner service as to know the exact life of the high-grade watch. We *do* know that the instruments we made in the very earliest days of manufacture are still giving the same accurate service. Many of these have registered over 100,000 miles and have been used on five and six different cars.

Model K-2
Price Complete
$75

Diameter 4 1-2 inches. Season odometer registers 100,000 miles and repeat. Trip odometer, 1,000 miles and repeat. Indicates all speeds up to 60 miles an hour. My Greatest Success

By R. E. Olds, Designer

4000 Carloads Wanted

Reo the Fifth, as automobile men know, is the greatest success of the season.

Orders have come to us for 4000 carloads. We have orders in at this writing, from six separate cities, for a trainload to go in one shipment to each.

Nearly one thousand dealers in 1000 towns have allied themselves with this car. I have never known a car so popular.

The Climax

This comes as the climax of my career—after 25 years spent in car building.

It comes from men who have faith in me. It comes from thousands of buyers, who think the best I can do is the best they can get.

And I am glad to know that every man will get more than he expects.

Never was a car built so carefully — never was a car so watched.

For Reo the Fifth is not built for a season. It is My Farewell Car, and all my fame in the years to come is at stake on this car's performance.

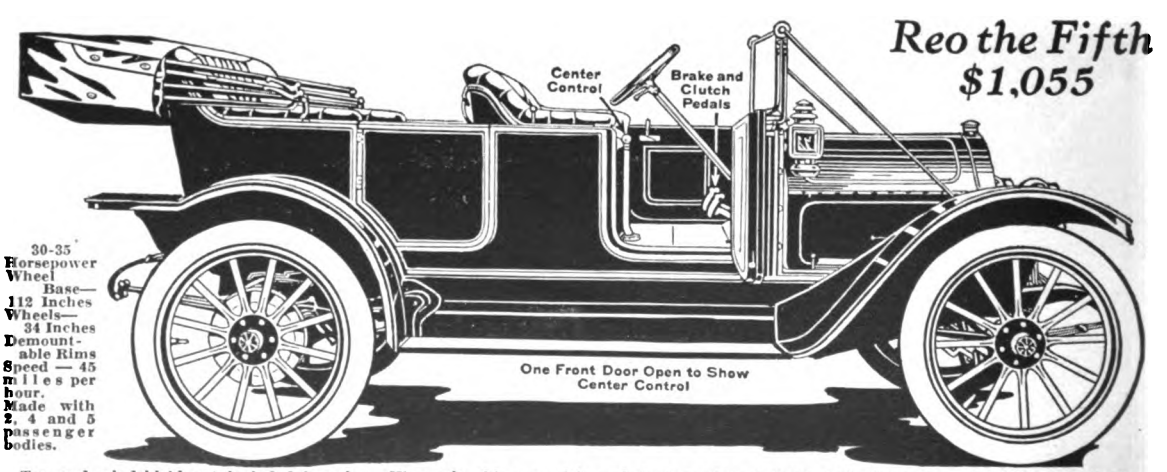
First Buyers Get An Underprice

I am also glad to know that those who buy now are getting overvalue. There was never a car so underpriced as this.

The price of $1,055 is too low to continue. The slightest advance in materials is bound to force it higher.

But you first buyers deserve this inner price. That is why we give it. The future of the car will be created by you—by the good words you say about it.

But I wish to avoid any expectation that this initial price will be permanent.



Write for our catalog, showing all the bodies, giving all the details, telling about this new center control.

There are dealers now in nearly 1000 towns ready to show this car.

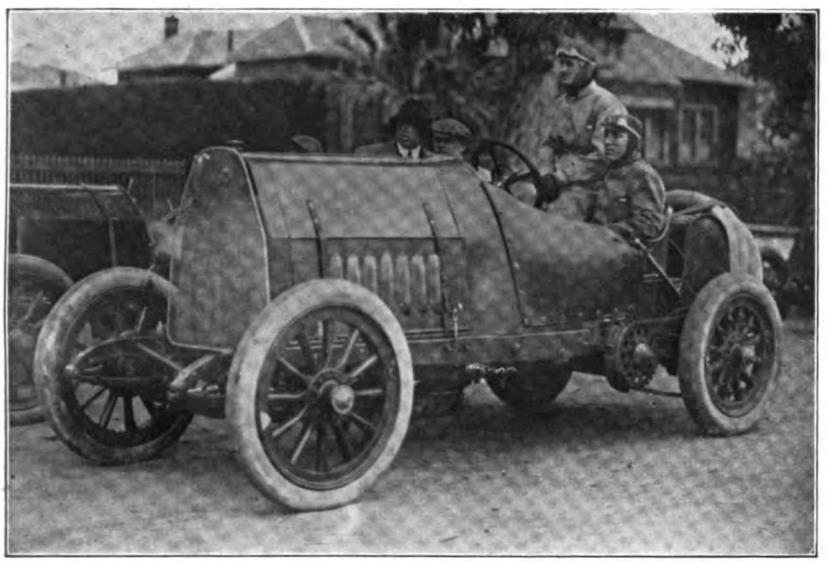
WORLD'S RECORD AT SANTA MONICA.

Tetzlaff in Fiat Surprises Californians, Exceeding Mark Set by Herrick in National by Nearly Four Miles an Hour---De Palma in Mercer Takes Medium Car Event, and Joermann in Maxwell the Light Car Race.

(By James H. Shippee.*)

TEDDY TETZLAFF driving a 90 horsepower Fiat, not only won the free-for-all race over the Santa Monica road course, Santa Monica, Cal., May 4, but created a new world's road race record of 78.5 miles an hour, exceeding the mark of 74.63 set by Harvey Herrick in a National car over the same course, Oct. 14, 1910, by nearly four miles an hour. Inasmuch as the accessories and supplies utilized on the winning car also are of interest, it is proper to note that the following share with Tetzlaff and the Fiat in the honors secured in this victory: Miller tires, Dorian rims, Bosch magneto and plugs, and Oilzum lubricants. The winner's time for the 303 miles was 3:50:57.



Teddy Tetzlaff in Fiat Car with Which He Created New World's Road Race Record at Santa Monica, Cal.

Caleb Bragg in a second Fiat won second place, his time being 3:54:05, and David L. Bruce-Brown, twice a winner of the Grand Prize, was third in a Benz; time, 3:56:32. Bragg's Fiat was equipped with Michelin tires and rims, Bosch magneto and plugs, and utilized Monogram oil. Bruce-Brown's Benz also was shod with Michelin tires and rims, and the ignition was by two Bosch magnetos connected, current being supplied to two sets of Bosch plugs. Monogram oil was used by him as well.

Three races were run, the free-for-all at 1:30 in the afternoon, and the others at 10:30 in the morning. These were the event for cars of 231-300 cubic inches piston displacement, known as the medium car race, and for machines 161-230 cubic inches, known as the light car race. In the first of these Ralph De Palma, driving a Mercer, fitted with Michelin tires and rims, Bosch magneto and plugs, and Rayfield carburetor, and utilizing Monogram oils, was the win-

*Pacific Coast staff correspondent.

Digitized by Google

Caleb Bragg and Second Place Fiat in Santa Monica's Free-for-All Event.

ner in 2:10:43, the distance being 151 miles. Second place went to Joseph Nikrent in a Case, fitted with Michelin tires and rims, Remy magneto, Bosch plugs and Rayfield carburetor, and employing Monogram oil, his time being 2:15:20. His teammate, Louis Disbrow, was in third place, in 2:22:23. This car was equipped in the same manner and used the same brand of oil.

In the light car event, George Joermann in a Maxwell was the winner. His time for the 101 miles was 1:37:57, and his car was equipped with Goodyear tires, Continental demountable rims, Splitdorf magneto, Bosch plugs and Miller carburetor. He also used Monogram oil. Second and third place went to two Flanders, the first being driven by Robert Evans in 1:40:38, and the second by Jack Tower in 1:42:00. These cars were equipped alike with Firestone tires, Dorian rims, Splitdorf magnetos and plugs, and both used Harris oils. Incidentally, the winner, Joermann, had never driven in a contest before.

The winner of the free-for-all secured $3500 in cash and the possession of the Dick Ferris challenge cup. Second place carried with it a prize of $1000, and third, $500. In the medium car event, the winner took $700 in cash and the Jepson challenge trophy; second place, $200, and third, $100. In the light car race the prizes were: First, $700 and the Chanslor & Lyon challenge trophy; second, $200, and third, $100. Besides these awards there were a number of prizes offered by makers of accessories, among which may be mentioned those of the Bosch Magneto Company, which will be distributed as follows: Tetzlaff, $200; Bragg, $100; Bruce-Brown, $50; De Palma, $100; J. Nikrent, $75; Disbrow, $50; Joermann, $100.

The result of the big race was a surprise in every sense of the word. Bruce-Brown was looked upon as a favorite, largely because of the fact that he had won the American Grand Prize twice, once with a Benz car, the same make as that with which he appeared in this race, and again last year in a Fiat. No National cars were entered, and this was something of a disappointment, inasmuch as it was remembered that Harvey Herrick in a machine of this make set a new world's record over this course last fall. Herrick was not in the race either, making an additional disappointment.

Previous to the Santa Monica races of last fall, the world's road record was held by Felice Nazzaro in a Fiat car, at 74.3 miles an hour, this having been made during the Targa Florio race in Italy in 1908. The nearest approach that had been made to it was in the winning of the race over this course in the fall of 1910, when Teddy Tetzlaff drove a Lozier at the rate of 73.22. Charles Merz in a National, during the medium car race of 1911, exceeded Nazzaro's mark for the first time, setting the figure at 74.42, only to lose his hard earned honor later in the day to his teammate, Herrick.

Tetzlaff drove in the 1911 race, being at the wheel of a Fiat, but for some reason he appeared to have lost something of his old generalship and his showing

David L. Bruce-Brown Finished in Third Place with His Benz Machine.

Digitized by Google

was not at all in keeping with a one-time record holder. Perhaps it was because of this, that he was not looked upon by the California public as even a possible winner this year. The course was conceded to be much faster than last fall, and a new record was confidently expected, but none would have admitted previous to the race that the mark would be exceeded by nearly four miles an hour.

By winning the free-for-all and securing the new record, Tetzlaff becomes a decided favorite in the forthcoming 500-mile event on the Indianapolis motor speedway, Memorial Day. Incidentally, there is much reason for expressions of a congratulatory nature from the Fiat Automobile Company, which sees the return of the world's record honor it lost after holding it for so long.

It is only proper to say that Tetzlaff gave a decidedly creditable exhibition of consistent driving throughout the race, but he appeared to lose his head temporarily during the last lap and came dangerously near, not only losing the victory so ably earned, but his own life and that of a number of spectators as well. At that portion of the course known as Death Curve considerable ingenuity had to be displayed in order to bring the racing cars about without accident. This was discovered by all of the contestants early in the running. On this last lap, with a lead of more than one round over his nearest competitor, Tetzlaff took this dangerous curve at full speed. The car crashed through the fence, burst a tire, and delayed its progress sufficiently to require nearly double the time it had taken for a number of previous laps.

George Joermann in Maxwell Won the 101-Mile Event for Light Cars.

But three cars of American manufacture were entered in the big event. Two of these were the Stutz, the product of the Ideal Motor Car Company, Indianapolis, Ind. It needs but a glance at the accompanying score to learn how consistently these performed. Round after round the two drivers were hardly more than a car's length apart as they crossed the tape. There was less than a second between them on the sixth and seventh laps, the latter being covered in exactly the same time by each. In the eighth they passed the timing instrument together. Neither of these cars stopped until the 19th lap, when Cooper pulled up at the pit for a new tire. Lewis made his first and only stop for the same purpose during the 23rd round. They were both still going strong at the end of the race, and without a sign of mechanical difficulty.

Lewis was the first to get away, and the first to appear at the grandstand. His teammate was sent away second. Barney Oldfield, making his first appearance in sanctioned racing after an absence of something over two years, was third in a Fiat. Right behind him were Tetzlaff and Bragg, his teammates. Bruce-Brown and his Benz and Dingley in his Simplex were the last two.

Tetzlaff swung into first place during the second lap, and was never headed. Oldfield was second with but three seconds between the two. Lewis in a Stutz was third. Bruce-Brown replaced the Stutz in the third, and Barney Oldfield appeared to be losing ground, Bragg passed Bruce-Brown in the fourth, the latter having experienced delay on one of the back stretches. In fact, the Benz was now in sixth place, with those ahead of him arranged as follows: Tetzlaff, Oldfield, Bragg, Lewis and Cooper. Dingley brought up in the rear.

Tetlaff stopped for the first time in the fifth, but he had a lead of almost two miles and could afford it. Oldfield was still in second place, with Bragg in third. Cooper had changed places with Lewis. Bruce-Brown stopped a moment in the sixth, and Bragg was giving Oldfield a hard struggle for second place. In the seventh, Oldfield drew away from Bragg. In the eighth Bruce-Brown regained his place at third. Tetzlaff was now almost two minutes ahead of Oldfield. Dingley went into his pit on this round.

Bruce-Brown called for new tires in the ninth, but had managed to pass Oldfield in the interim. He retained this lead by a few seconds at the end of the 10th round, but lost to Bragg in the 11th. Tetzlaff had nearly lapped the entire field by this time and was making splendid headway. Much of this was lost in the 12th, however, when he stopped to change a tire. Oldfield drew up for repairs. Bragg was in second place at the end of the round, but with only three seconds to spare.

Oldfield lost 20 minutes in the 12th lap, only to draw up at the pit again in the 13th with additional trouble. Bruce-Brown passed Bragg in the 14th, and the same positions were maintained until the 32nd. Oldfield was now making a brave attempt to catch the field, and drove the 16th lap in 5:53, the fastest of the race up to that point. On the 17th, Dingley passed the Stutz entrants and arrived in fourth place. Tetzlaff stopped again on the 18th, and as stated before, Cooper made his first call at the pits on the 19th.

The three drivers, Tetzlaff, Bragg and Oldfield, made the 22nd lap in less than six minutes, and the race began to take on the aspect of a real contest. Bragg made the fastest time of the course to that point, rounding the 8:41 miles in 5:44. He came into the stretch with Oldfield, but the latter seemed to realize that the race was not for him, and gave his teammate the turn ahead of him. Tetzlaff made the 24th round in 5:45 and Bragg in 5:50.

Bruce-Brown joined the speeding machine in the 24th, still further lowering the time to 5:36. Meanwhile Dingley had lost his place again, first to Lewis and then to Cooper, and was now sixth. Bragg lost valuable time in the 25th, but managed to tie Bruce-Brown for the lap in the 26th. The score sheet shows that Lewis covered this round in 5:43. Oldfield went out in the 27th. Bruce-Brown also was held up at this point.

Beginning with the 28th lap, it became a steady whirl, with hardly a round that was not made in less than six minutes, by the three leaders. Bruce-Brown had the best of this manoeuvre in the 28th, 29th and 30th, making the fastest time of the race in the last named, 5:27. It looked a little as if Bruce-Brown's chance had come in the 32nd, when Tetzlaff drew up at the pits, but in a few seconds the Benz pilot was beside him. Bragg was not slow to grasp the situation and gained more than two minutes on Bruce-Brown, running into second place. Bragg made still another gain in the 33rd, when his rival was held up once more.

With only three more laps to go, the three leaders, renewed their contest for supremacy. Dingley was out of the running at this point, and the two Stutz cars, although making the rounds in better than six minutes, were hopelessly behind. Tetzlaff made his best time, 5:31, in the 34th, and came within two seconds of repeating the performance in the next to the last lap.

Then he lost his generalship. Rounding Death Curve at a terrific speed he crashed into the fence, just as Bragg, almost two laps behind him, came into sight. With a "whoop" Bragg dashed down the course. A moment later, a second "whoop" announced the approach of Bruce-Brown. While Tetzlaff was extricating himself from the results of his thoughtlessness, Bragg reduced his intervening time by three minutes, and Bruce-Brown came very near doing the same. Fortunately, Tetzlaff's Fiat was not damaged in any way. Two new tires soon placed it in position to renew the fight. The last lap was covered in 10:28, whereas the one just before it was made in 5:33. The race was won because of the inherent good qualities of the car.

In every respect it was the greatest speed contest the industry has known. Not only did Tetzlaff complete the distance at an average speed of 78.5 miles an hour, but if he had maintained his previous average to the end, the new record would have been approximately 80 miles.

But while the greatest interest naturally attaches to the big race, it must not be forgotten that the other events were of equal importance. The so-called medium car winner was Ralph De Palma, who is by

De Palma took the lead in his race on the fourth lap. Disbrow's Case was a strong contender, but the Mercer proved too much even for the higher powered Case in the hands of Joseph Nikrent. The Fords made a splendid showing in the light car event.

One of the features of this combined contest was the racing of the two brothers, Joseph and Louis Nikrent, the former in a Case and the latter in a Buick. They came across the tape almost together at the end of the ninth lap. Shain in the Schacht was driving

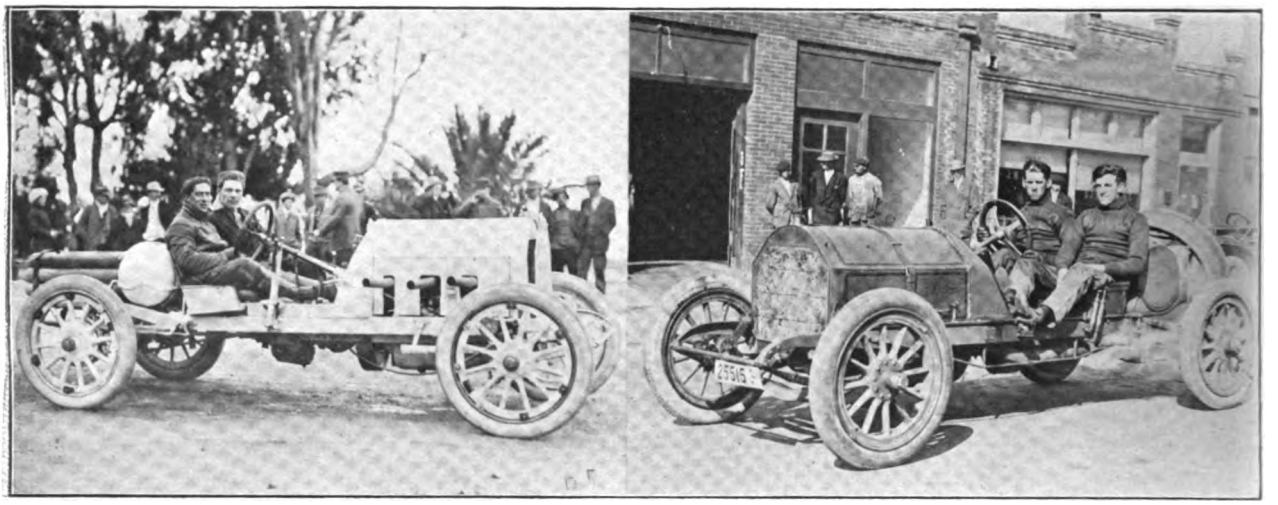
no means unknown on the Pacific Coast, but the light car event went to a man who was driving in his first race—George Joermann. The two were run together.



Promptly at 10:30 in the morning Earle Devore was sent away in a Buick, followed by Disbrow in a Case. Joermann was the last man off. Devore rounded the first lap in the lead, with Disbrow close behind him. De Palma in a Mercer was a good third. Jack Tower was the first man home in the little car event, with Evans, his teammate close behind him.

a consistent race and taking the curves like a veteran.

At the end of the 10th lap, De Palma's Mercer was almost a whole lap ahead of all the others in the medium car event. The two Flanders and Nikrent's Buick came down the stretch at this point in the light car event, almost together, and just as they were about to cross the tape, Joermann's Maxwell shot ahead of them like a bullet.

This latter race ended on the 12th lap, Joermann's face wearing a broad grin as he passed the finish flag

Digitized by Google

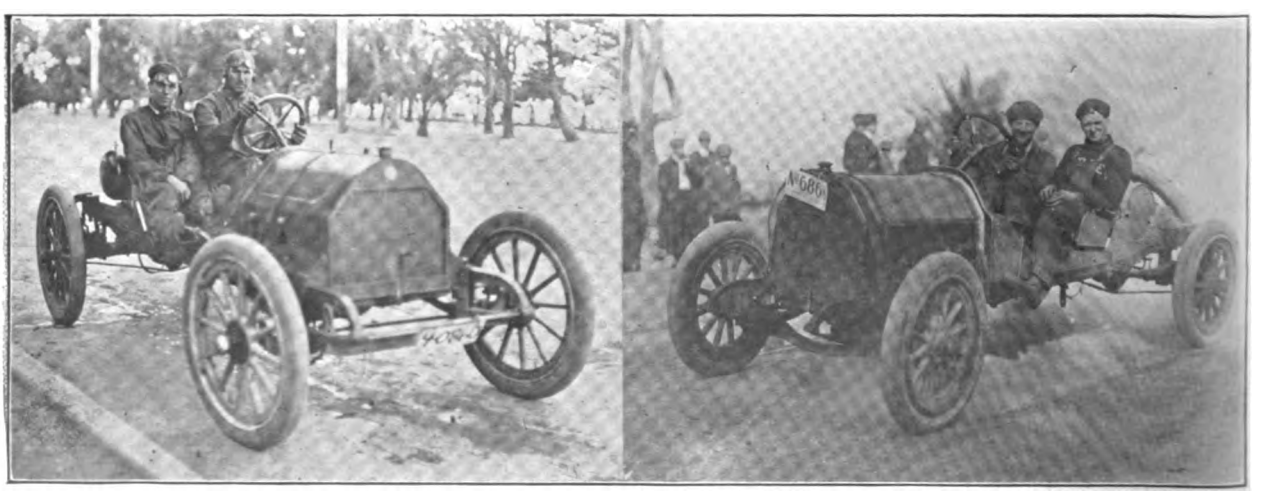
a winner. Evans in a Flanders was second, only a few hundred yards behind the Maxwell, and his teammate, Tower, was third. Joermann's spurt at the end of the 10th defeated the two Flanders and put the Buick out of the winning class.

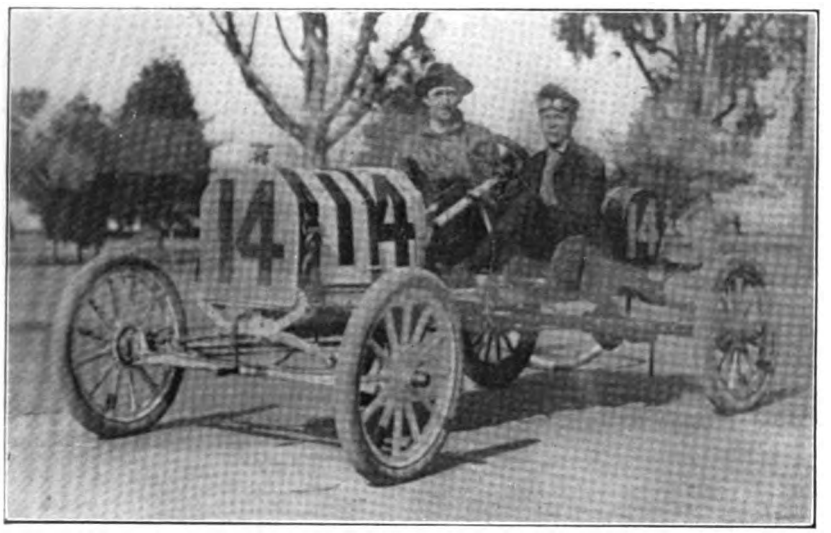
The two Case cars showed up strong in the medium car race, holding second and third place throughout. Of course, De Palma's lead was far too great to admit of the Case machines catching him. The Mercer's driver was easily the favorite with the crowd, and a rousing cheer greeted him as he crossed the tape a winner. Joseph Nikrent was second, and Disbrow, third.



Following the road races, a meet was held on the Los Angeles motordrome, May 5, in which most of the machines which took part in the previous day's events were contestants. Several new speedway records resulted.

Caleb Bragg in a Fiat set a new world's mark for five miles, regardless of class, covering the distance in 3:11.75. The previous record was held by Ralph De Palma. Louis Disbrow in a Simplex took Barney Oldfield's mark for the same distance for cars of 451-600 cubic inches piston displacement, his time being 3:25.1. Joseph Nikrent in a Case lowered Ray Harroun's mark for cars of 231-300 inches, with a time of 3:44.3.

Disbrow in a Case set a new record for 10 miles in the 231-300 class, going the distance in 7:46.4. He also made the fastest mile of the day, driving a special Jay Eye See car in 0:38.



In the race for 25 miles, Ralph De Palma in a Mercer and Joseph Nikrent in a Case, with the same two machines in which they finished first and second in the medium car race the previous day, gave a splendid exhibition of generalship. De Palma won, setting a new record for cars of 231-300 inches, his time for the 25 miles being 18:53.8.

It will not be out of place to make some mention of the good work performed by the officials of the two

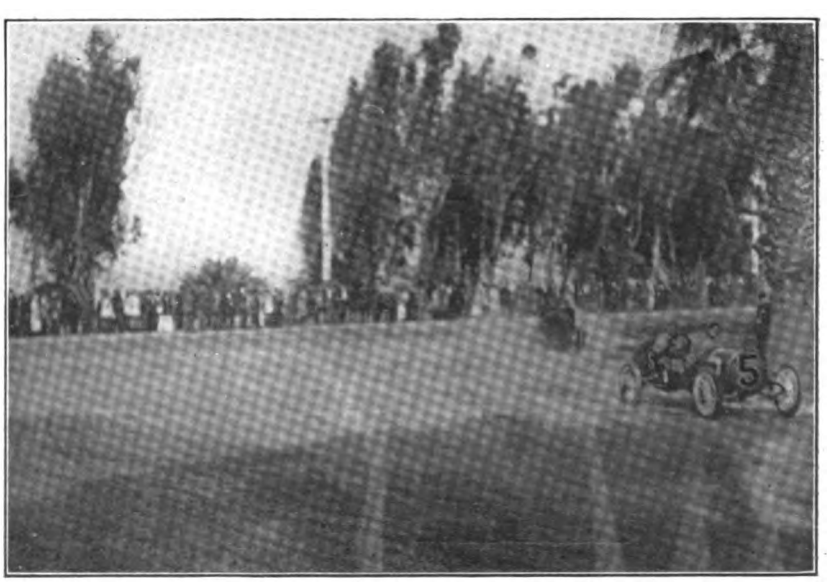
A. J. Charles in Ford, a Competitor in the Light Car Division.

meets, particularly that of A. M. Young, the manager. In every respect he appeared to be the right man in the right place, and it was due in no small measure to his energy and diplomacy that the big race was the great success it proved to be. The other officials were: Starter, F. J. Wagner; clerk of the course, P. H. Grier; referee, R. P. Hillman; timers, W. H. Halliwell and C. Halliwell; judges, Jacob Jepson, Walter Chanslor and Ralph Hamlin; technical committee, Capt. H. D. Ryus; official representative of the American Automobile Association, E. J. Custer.

ROCKINGHAM PARK RACES.

New Englanders will not be required to journey to Indianapolis, Ind., Memorial Day, in order to witness one of the most interesting speed contests of the year. Those who have charge of the proposed race meet at Rockingham Park, Salem, N. H., May 30, are now ready to announce a portion of the programme, which indicates that there will be plenty of variety to suit all classes of spectators.

The Berkshire Motors Company, Cambridge, Mass., has decided to withdraw the special racing machine it was constructing for the 500-mile race at Indianapolis, and to enter it at Rockingham park instead. Walter Clapp has charge of the entry, and is trying to arrange with Harry F. Grant, twice a winner of the Vanderbilt cup, to drive the machine. Grant has taken a decidedly active interest in the meet, and it would not be at all surprising if he should change his mind about retiring from the field, just this once.



Fred Collins of Dorchester, Mass., who is well known as an amateur driver, has entered his 90 horsepower Chadwick, at the wheel of which he will be seen in the free-for-all amateur event. Leland Hersey of the same city will drive it in the professional races.

R. R. Ross, manager of the Boston branch of the Fiat Automobile company, promises that one of the Fiat cars which took part in the Santa Monica races, recently held on the Pacific Coast, will be entered for the professional events, and that one of the company's well known pilots will be at the wheel.

In addition to the motor car races, an aviation programme will be arranged. Lincoln Beachey, the well known Curtiss aviator, will make exhibition flights, and is trying to secure a match race with Harry Grant or some other equally well known automobile driver.

RECORD BREAKING MILLER TIRES.

In these days of exceptionally fast speed tires play an important part in every long distance event. These shoes used by Teddy Tetzlaff in winning the free-for-all at Santa Monica, Cal., May 4, and thereby establishing a new world's record, were made by the Miller Rubber Co., Akron, O. This is the first time that Miller tires have figured as prominently in important contests.

Ralph De Palma and Winning Mercer in the Medium Event, Rounding Death Curve.

FOWLER TO MAKE THE VORTEX.

The Fowler Lamp & Brass Company, of Chicago, has taken over the Reichenbach Laboratories Company, maker of the Vortex carburetor and will concentrate the entire business in the Fowler building on East 24th street, Chicago, where the line of the Roberts Brass Manufacturing Company, which was recently purchased, will also be handled.

LECTURES ON KNIGHT MOTOR.

It is more or less well known that the Boston Y. M. C. A. automobile school has taken up a course of instruction with respect to the Knight sliding sleeve motor, the students having complete access to the establishment of J. H. MacAlman, 96 Massachusetts avenue, agent for Columbia and Stearns-Knight cars. Recently, H. F. Farrow, the Knight expert employed with the MacAlman agency, delivered a highly instructive lecture before the school, illustrating his talk with one of the motors, which was completely disassembled for the purpose of bringing out its novel features.

Robert Burman at the Wheel of Latest Cutting Special Model.

WISCONSIN CLUB AFTER SIGNS.

Wisconsin laws require towns to erect and maintain guide posts and sign boards, and not all towns have complied with the regulations. The Milwaukee Automobile Club has started a campaign against such towns, and promises prosecution for town boards which persist in ignoring the law. The Union Automobile Club of Brodhead, Wis., is also taking up the sign question, and will post the road between Janesville and Brodhead at its own expense, so that by next summer Wisconsin should be pretty well posted.

Universal lighting means the safe use of public ways at night. It need not inflict unreasonable restrictions on anyone. Why not follow Massachusetts' example?

TO FORM NEW MAXWELL CLUB.

The Maxwell-Briscoe Motor Company, Tarrytown, N. Y., a subsidiary of the United States Motor Company, has decided to form a 50,000-mile Maxwell Motor Club to encourage long distance touring among Maxwell owners. Gold medals are to be given to those who cover the 50,000 miles, and silver medals to those who cover 25,000. It will not be necessary to make these distances in one car, but the mileage of several Maxwell cars owned at different times may be added to make the total.

BURMAN'S CUTTING MODEL.

The accompanying illustration is that of Robert Burman, who holds the world's record for speed in an automobile, at the wheel of a Cutting car, made by the Clarke-Carter Automobile Company, Jackson, Mich. The man beside him is Charles Cutting, after whom the line produced by this concern is named. The car itself is of particular interest, in that it follows the design suggested by Burman.

It is equipped with a very powerful motor, rated at 100 horsepower. The pointed radiator cuts the wind resistance to a minimum. The seat is located far back, about in the position occupied by the rear seat in the ordinary touring car. The steering gear has been constructed long enough to reach this seat, and the whole design presents an unusually attractive appearance. Burman maintains that it will hold better balance at high speeds than with the passengers located in any other manner.

In many ways this car is a duplicate of the racing machine which Burman will drive in the 500-mile race on the Indianapolis motor speedway, May 30. He has been working out this machine for several weeks and expects to be one of the most formidable entries in that event. Incidentally this will be the first appearance of a Cutting in long distance racing.

TITANIUM FOR STEEL.

Titanium promises to be largely used in the steel parts of automobiles, according to B. C. Spitzley of the Abbott Motor Company, Detroit. It is now being used in steel rails with excellent results, the New York Central having found that such rails in service lost in weight but one pound a yard when ordinary steel rails lost three pounds a yard. The titanium rails are tougher and have a higher tensile strength than rails of ordinary steel. The cost of treating steel with titanium is but 75 cents a ton, and the increase in tensile strength amounts to 20 per cent.

Tarvia

Preserves Roads
Prevents Dust~

Broadway at Dobbs Ferry, N. Y. Roadway treated with Tarvia-B.

Dobbs Ferry's Experience with Tarvia

BROADWAY in New York is one of the longest highways in the world, running from the Battery in New York City far beyond the city limits to the north, following the line of the Hudson for over fifty miles.

It is one of the great historic thoroughfares of the State and is one of the principal automobile highways in the country on account of its picturesque views overlooking the Hudson and the fine estates which border on it.

The maintenance of this road has proven very expensive and for the purpose of reducing the annual costs, Dobbs Ferry used Tarvia on its section of Broadway. The results are described in the following letter:

Dobbs Ferry, N. Y., January 30, 1912.

Gentlemen:

"The Tarvia-B furnished by your Company to the Village of Dobbs Ferry through Michael J. Francis, Contractor, has proven entirely satisfactory. The roadway of Broadway from the Hastings village line to that of Irvington, which was practically a new macadam road, is now one of the finest in the State and Ashford Avenue, which is one mile in length, also a macadam road, is in perfect condition after having been treated with your Tarvia. The automobile traffic is extremely heavy, being approximately one hundred per hour and on Saturdays and Sundays about double that number, and yet the roadway shows no effects of such traffic.

"The Board of Trustees and the people of Dobbs Ferry are unanimous in their praise of Tarvia and after having a large experience in the use of road binders, Tarvia-B has my unqualified endorsement."

Yours very truly,

Hugh P. Tiernan, Village Engineer.

Tarvia is a coal tar product scientifically and carefully prepared for road use, in three grades—Tarvia-X for road and pavement construction, Tarvia-A for surface work (applied hot), Tarvia-B for dust prevention and road preservation (applied cold). Illustrated booklet describing the different treatments free on request to nearest office.

SECOND 500-MILE SWEEPSTAKES RACE.

Entries Close for Annual Memorial Day Event on Indianapolis Speedway---Something Concerning the Drivers and What They Have Accomplished in the Past---Twenty-Seven Cars Will Start at 10 in the Morning.

TWENTY-SEVEN cars are entered for the second international 500-mile sweepstakes race on the Indianapolis motor speedway, May 30. Last year there were 40, but this number was considered by all concerned as being too many to be handled with absolute safety to both contestants and spectators. Accordingly, the contest board of the American Automobile Association adopted a rule restricting the number of cars which may start in any race to 30. This explains the reduction in grand total this year, and it is anticipated that the result on the day of the event will be much more satisfactory in every way.

Gilbert Anderson, Stutz 1.

Leonard Zengel, Stutz 2.

It will be remembered that Ray Harroun in a Marmon won the first 500-mile race last Memorial Day, his time being 6:42:08, making an average of 74.59 miles an hour. Ninety thousand people witnessed this victory and were unanimous in the opinion that it was the greatest speed contest in the history of motoring. Of course, much faster speed has been demonstrated since that time, although not in a race covering so many miles. The world's road record is now 78.5 miles an hour, made by Teddy Tetzlaff in a Fiat over the Santa Monica road course, May 4, and inasmuch as many of the cars which took part in that event are scheduled to appear at Indianapolis, Memorial Day, it is expected that this year's average will be not far from 80 miles an hour.

The 27 cars will be sent away promptly at 10 o'clock in the morning, and for nearly seven hours the best known drivers of America will compete for the 12 prizes offered. The purse totals $50,000, divided as follows: First, $20,000; second, $10,000; third, $5000; fourth, $3000; fifth, $2500; sixth, $2000; seventh, $1500; eighth, $1400; ninth, $1300; 10th, $1200; 11th, $1100; 12th, $1000. In addition a number of makers of accessories of national reputation have offered special prizes conditioned upon the use of their equipment.

The complete list of entries, with the drivers, appears herewith. Most of these machines are well known, at least by name, although it is understood that in several instances special construction has been utilized in an effort to present more speed. Undoubtedly additional information concerning these will be available before the race actually takes place. At present, the public is more than ordinarily interested in the drivers.

Gilbert Anderson is best known because of his performance with a Stutz car, made by the Ideal Motor Car Company, Indianapolis, Ind., during the first 500-mile race a year ago. His machine was practically unknown, being the first produced by this concern. In fact, the company's organization had not been completed at that time, and its future depended almost entirely upon the showing made by this car in this race. Anderson appears to have been equal to the occasion. He drove the machine the entire 500 miles without a stop, thereby establishing the Stutz as possessed of remarkable quality. Since that race he has driven Stutz cars in a number of events, always with the same result, insofar as non-stop performances are concerned, and he finished in second place in his class at Fairmount Park, Philadelphia, last October. His first racing experience was in the Crown Point races of June 18-19, 1909, when for 50 miles he lay on the hood of a Marion car, driven by Monson, adjusting a carburetor.

Teddy Tetzlaff, Fiat 3.

Robert Burman, Cutting 15.

Leonard Zengel finished with place in every race

Digitized by Google

in which he started in 1911, when he was at the wheel of National cars. He has been a racing driver for a number of years, and perhaps his most important victory previous to his connection with the National Motor Vehicle Company, Indianapolis, Ind., was the winning of the 1910 Fairmount Park race, in a Chadwick. Last year he took the Elgin national trophy, and finished third in the Fairmount Park sweepstakes event. His appearance in this race in a Stutz car will be awaited with considerable interest.

Teddy Tetzlaff holds the world's road race record with the Fiat machine in which he will appear at Indianapolis May 30. This is not exactly a new experience for him, as he came into prominence during the Santa Monica road race of 1910, when he created a new American road race record with a Lozier car. He is a Californian, and has been driving Fiat cars since early in 1911. For some reason, he did not show up at all well in the Santa Monica race of last October, in which he was at the wheel of a Fiat, but he appears to have regained his old driving form in the latest contest over this course.

Ralph De Palma finished in first place 30 times out of 46 starts in 1911, placing him at the head of the list of drivers for the year. He has been driving since 1908, when he appeared in the Briarcliff races. Inasmuch as during that year he entered 16 events and finished in first place 10 times, and followed this in 1909 with 34 firsts out of 47 starts, and in 1910 with 30 firsts out of 48 starts, he established a record for consistent work which will be hard to exceed. He has been seen at the wheel of numerous makes, doing his best work, perhaps with the Mercer and Simplex. It was in a Mercer in which he won in his class at Santa Monica, May 4.

Louis Disbrow began his racing career in a Rainier in the Motor Parkway sweepstakes of 1908, finishing in second place. In 1909, he drove a car of the same make in four 24-hour races at Brighton Beach, L. I., in one of which he secured a record of 19 hours' continuous driving on a mile track. During the same year he won the $10,000 Atlanta trophy. He has driven the Knox in numerous hill climbs, and last year was particularly successful in a special Pope-Hartford racing machine. His recent activity on the Pacific Coast in a Case car places him in an enviable position.

Harvey Herrick is another California boy. In 1910 he won the Los Angeles-Phoenix race in a KiselKar, and last year he was at the wheel of a National, representing the Pacific Coast agent. He won the Levis trophy in the Bakersfield road race July 4, created a new world's record for road racing in the Santa Monica race in October, and won the Los Angeles-Phoenix race for the second time, in 1911. This will be his first race on the Indianapolis speedway.

Spencer E. Wishart is rated as a millionaire who drives his own cars, purely for the sport of driving. For the past four years he has been at the wheel of Mercedes machines, although he has not figured as a prominent winner. In the Fairmount Park race of last October, he was disqualified, because he drove a portion of a lap without a mechanician, after finishing in second place. He finished in third place in the seventh Vanderbilt Cup race in November.

Howard Wilcox won first place in his first race, the five-mile Southern Championship event at New Orleans, Nov. 20, 1909. During 1910 and 1911 he was seen at the wheel of a National, figuring very prominently with cars of this make in numerous hill climbs and other events. With a National, he established a new world's stock car mile record at Jacksonville, Fla., in March, 1911.

Donald Herr, who served as mechanician in the first 500-mile race, is the youngest driver on the

Digitized by Google

Hugh Hughes, Mercer 21.

Bert Dingley, Simplex 12.

National team, from point of experience, but has succeeded in winning several events since becoming identified therewith. His chief claim to popularity was the winning of the Illinois trophy in the Elgin stock car races of 1911. He also finished in third place in his class at Fairmount Park in October.

Harry Knight began driving when he was but 13 years old, piloting a Queen car over the road from Indianapolis to Washington, and making a call upon President Roosevelt at the White House upon the successful conclusion of the trip. In 1910 he drove Westcott cars in a number of events, and last year he drove both Westcott and Cole cars. It was with a Westcott that he took the Hoster-Columbus trophy in Columbus, O., Sept. 13. This will be his first appearance in a Lexington, as well as the Lexington's first long distance race.

Bert Dingley drove in the first Vanderbilt Cup race in 1904, and the following year took part in the Gordon-Bennett race in France. Since that time he has been a consistent winner, although most of his victories have been on the Pacific Coast. Last year he began by winning the free-for-all at Alameda, Cal., Feb. 22, and followed this by finishing second in the race for the St. Francis trophy, second for the Levis trophy at Bakersfield and second for the Shettler cup at Santa Monica. In 1911 he drove a Pope-Hartford.

Donald Herr, National 9.

W. Barndollar, White 14.

W. Barndollar has been a racing driver since 1906, but has intentionally kept from the public, it is stated, because of his desire to keep his professionalism from his family. Because he is practically unknown and because the White car, made by the White Company, Cleveland, O., has not been seen in racing events during recent years, this addition to list of entrants is of decided interest.

Robert Burman is best known because of his world's speed record, having driven the "Blitzen" Benz a mile in 0:25.4 at Daytona, Fla., April 23, 1911. This was at a speed of 141.73 miles an hour. He tested the first Buick car produced by the Buick Motor Company, Flint, Mich., and was at the wheel of cars of that make in various contests until 1911. In 1910 he drove the Marquette-Buick, but the disqualification of these machines robbed him of many victories. His appearance in this event with a Cutting, made by the Clarke-Carter Automobile Company, Jackson, Mich., will be his first with cars of that make.

Charles Merz, Stutz 28.

Howard Wilcox, National 8.

Lee Frayer is one of the oldest men in the industry. After a short experience with motorcycles and air-cooled motors, he began the production of the Frayer-Miller type of the latter, and helped to organize what was known as the Oscar Lear Automobile Company in the fall of 1904. His first race was the six-day contest at Long Branch in August, 1905, during which he was at the wheel most of the time, covering 3302 miles and making a continuous run of 1877 miles. His connection with the Columbus Buggy Company, Columbus, O., dates from July, 1909, when he took charge of the engineering department as chief engineer. He has driven in a number of events, and was at the wheel of a Firestone-Columbus in last year's 500-mile race. It is understood that the same car will be utilized in this event.

William Liesaw is not particularly well known as a racing driver, although he has been quite success-

Digitized by Google

ful in many of the minor events of the country, and understands Buick cars thoroughly.

William Endicott has had a number of farewell appearances. Just before the 500-mile race of 1910, he announced his return to racing solely because there were no Cole cars entered, and he did not like to see the race go by without his favorite machine being represented. This year he will be at the wheel of a Schacht and for the first time, having driven Cole cars exclusively heretofore. Incidentally, he was the first driver employed by the Cole Motor Car Company.

Ralph Mulford drove Lozier cars for four years, previous to 1912. With Harry Mitchell he won the 24-hour race at the Point Breeze track, Philadelphia, in 1907. The following year he helped create a new world's record for 24 hours at Brighton Beach, and three weeks later finished in second place in another event of the same character, exceeding his former time. He finished third in Briarcliff race the same year. In 1909 he created still another 24-hour record. In 1910 he took the Elgin national trophy and finished in

Lee Frayer, Firestone 16.

Harvey Herrick, Case 6.

better than fifth place in every event entered. Last year he won the Vanderbilt cup, and finished second in the Fairmount Park sweepstakes. This is the first time he has been seen in a long distance event in any other car than a Lozier. The Knox, made by the Knox Automobile Company, Springfield, Mass., is owned by Mulford.

Hugh Hughes has had a long racing experience, although not prominent among the list of winners until last year. He drove a De Dietrich in the Gordon-Bennett race in France in 1904, and when he first came to America from England, where he was born, he was at the wheel of an Allen-Kingston in several 24-hour events as well as numerous hill climbs. Later he went with Walter Christie, handling the latter's front drive machine on many circular tracks. In 1910 he did good work with a Fal-Car. Last year he organized the Mercer racing team. His chief victories were the Kane County trophy at Elgin, Aug. 25, the class 3C event at Fairmount Park in October, and the fourth Savannah Challenge trophy in November.

Ralph Mulford, Knox 19.

John Jenkins, Continental 27.

Joseph Horan is well known as a driver of Lozier cars, particularly at important race meets in the South. He acted as mechanician for Mulford for three years, and in the same capacity for Seymour and Cobe in long distance events. This is his first race as driver on the Indianapolis speedway.

Melvin Marquette is something of an unknown. At least, his name does not appear in the list of drivers who have been at all prominent during the past few years.

Joseph Matson is better known nowadays as a driver in reliability events, although previous to 1910 he was frequently seen at the wheel of Chalmers cars, securing the Masapequa trophy in 1909 with a car of that make. He also created a number of world's records with these machines.

John Jenkins was at one time a pugilist and has two crippled hands. He drove his first race in America on the Indianapolis speedway. Formerly, he had driven a Fiat on the Continent. It was during the 24-hour race on the Los Angeles motordrome, April 9, 1911, that he came into prominence, and throughout the remainder of the year was seen at the wheel of Cole cars. He drove in last year's 500-mile race, and took the Hamilton trophy at Cincinnati, O., Sept. 9,

Ralph De Palma, Mercedes 4.

William Endicott, Schacht 18.

Digitized by Google

finishing second for the Cincinnati trophy the same day. The Continental is a new car.

Charles Merz made his first appearance in a race when a boy in short trousers at Indianapolis, during

Louis Disbrow, Case 5.

Joseph Horan, Lozier 22.

which he crashed through a fence, and narrowly escaped death in the resulting wreck. Less than two weeks later, Nov. 16-17, 1905, he was back at wheel of a National with Fred Clemens in a 24-hour race in that city, creating a 1000-mile record which stood for some years. In fact, the National created new records from 630 miles to 24 hours. Merz always has driven National cars, heretofore. Last year he won the St. Francis trophy on the Pacific Coast, finished second in a number of long distance events, and ended the year with a new world's road record during the race for the Shettler cup at Santa Monica, Oct. 14.

FIGHTING INDIANAPOLIS TAX.

Four members of the Hoosier Motor Club have brought suit against the city of Indianapolis to prevent it from enforcing the automobile license ordinance which was enacted recently. The new license amounts to from $5 to $15 a year, according to the size of the car, while the former fee was $3. It is charged that the ordinance is unconstitutional in that it was passed for revenue, and that it is class legislation, creating an unequal and non-uniform taxation on a special class of personal property. Several automobilists who have been arrested and fined for failing to comply with the ordinance have announced their intention of taking an appeal, so that the matter will be well threshed out.

FREE OVERALLS FOR WORKMEN.

The R-C-H Corporation, Detroit, maker of the R-C-H car, has started an innovation in factory management by furnishing its workmen with their working clothes. Each employee receives two suits of overalls and these are kept clean and in repair by the company.

GEORGE SUMNER, INC.

A little over a year ago George Sumner, Inc., of New York City, took over the agency for the Rayfield carburetor, made by the Findeisen & Kropf Manufacturing Company, Chicago. At that time this product was very little known in the East. However, since this agency was established the merits of the device have consistently been brought to the attention of the public until the increase in the output in this section has been some 700 per cent.

With the object of still further enlarging the business, as well as to enable the public to have the advantage of personal service, the concern recently opened a branch at 755 Boylston street, Boston. This office will be in charge of J. K. Dalton, an able carburetor expert, who is prepared to give the same liberal service as always has been given by the New York house.

While this concern is a dealer and manufacturer of automobile specialties, it never has carried more than three lines at any one time, believing it the part of wisdom to bring all of the experience and knowledge of its members to bear upon the particular articles that it is exploiting. Under this arrangement the consumer is held to obtain better attention and more satisfactory treatment.

BRUSH RUNABOUTS FOR LINEMEN.

Linemen of the New England Telephone & Telegraph Company will use Brush runabouts, 50 having been ordered from the United States Motor Company, New York City. Some of the men have been using machines of the same make during the past year with great success, but the recent order was placed only

Spencer Wishart, Mercedes 7.

Harry Knight, Lexington 10.

after investigation of all the runabouts on the market. The company is an enthusiastic believer in the motor car, and uses 20 large Sampson trucks, also a product of the United States Motor Company.

Digitized by Google

BLUE RIBBON METAL POLISH.

Nothing detracts so much from the appearance of a car as to have the brass and metal trimmings tarnished, but many motorists find it tiresome to keep these looking bright and attractive. Those who have had much experience with the Blue Ribbon cream metal polish, made by the International Metal Polish Company, Indianapolis, Ind., insist that there is little reason for such lack of attention if supplied with a suitable product.

The Blue Ribbon polish is a thick oil cream, or emulsion, put up in half-pint, pint, quart, half-gallon and gallon cans for the owner or private garageman, and in five and 10-gallon packages for public garages, fire departments and other large users. It is guaranteed to remove the tarnish and not the metal, and therefore is entirely free from injurious ingredients. The maker claims it does not settle, requires no shaking before using and leaves no sediment in crevices. It is equally adaptable for household use.

PITTSFIELD SPARK COIL AFFAIRS.

The capital stock of the Pittsfield Spark Coil Company, Dalton, Mass., has been increased from $100,000 to $250,000, the increase being for the purpose of installing new machinery and generally enlarging the business. Coils, timers and other electrical accessories are made. Officers have been elected as follows: President, W. P. Wood; treasurer, L. B. Hopkins.

FREAK CAUSE FOR ARREST.

A New York policeman recently arrested the driver of a demonstrating truck, preferring the charge that he was operating on a manufacturer's license a truck that "did not bear sufficient evidence of hard work." The driver was held for three days before he got a hearing, and complaint has been made to the police commissioner by the New York Automobile Dealers' Association, protesting against the unwarranted arrest.

FLANDERS A TRADE MARK.

The Studebaker Corporation, Detroit, has been granted a trade mark on the name Flanders, the application which was made last December having been acted upon favorably recently. For some time there was a rumor that another concern was hoping to reap some of the benefit of the name, which may or may not have led to its being trade marked.

TRAVELLING EXHIBIT.

J. S. Conwell, manager of the United Motor Los Angeles Company, the southern California agent for the United States Motor Company, New York City, recently tried out a travelling exhibit of Maxwell and Columbia cars and Sampson trucks with considerable success. The cavalcade went on a two weeks' tour through the smaller California towns and cities, where it excited much interest.

WINS DESERVED PROMOTION.

The Rhode Island branch of the Olds Motor Works, which was established the first of the year, is in charge of Ernest L. Smith, who was transferred from Boston to Providence at the time the branch was opened. Mr. Smith was for years a commercial salesman and when he decided to become identified with the automobile industry he made a connection with the sales department of the Olds Motor Works and was stationed at Boston. Mr. Smith's home has been at Pawtucket, R. I., for years and he is widely and favorably known.

Ernest L. Smith, Manager Rhode Island Oldsmobile Branch.

When the company decided that a branch was necessary in Rhode Island in order to give its patrons the consistent attention and service they were justified in expecting, Mr. Smith was named as the manager. This was followed by the opening of admirably located salesrooms at 77 Exchange street and the establishment of a service station in Broad street. The policy of the company is to give to Oldsmobile owners factory attention and to deal with them direct instead of through an agent. The Rhode Island branch has the equipment and the facilities to deal with any condition that may arise, and Mr. Smith says that the satisfaction this insures will be realized.

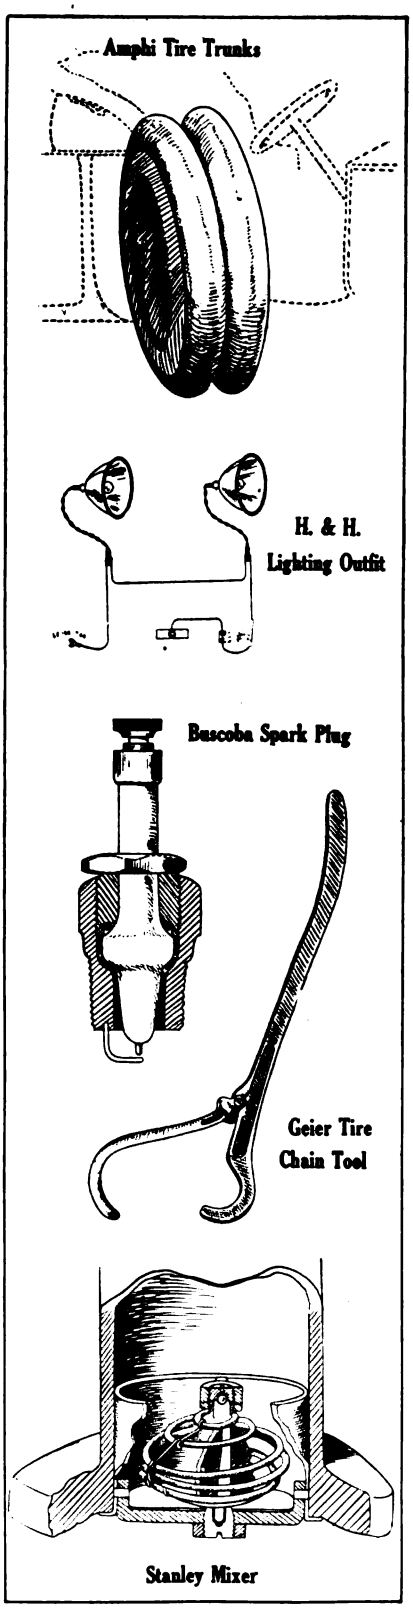
RHODE ISLAND GOOD ROADS MONEY.

The state of Rhode Island is to spend $850,000 for road improvement and maintenance work, the Legislature having appropriated the sum of $250,000 for this purpose. In addition a bond issue of $600,000, approved by the voters last fall, is available for good roads work.

Motorists should see that their individual states require lights on all vehicles using the highways at night.

Digitized by Google

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.



Amphi Tire Trunks, made by the Coward Auto Supply Company, Motor Mart, Boston, are adapted to take the place of a door, so that installing them at the side, on the running board, does not mean the obstruction of one of the doors as is usually the case. The trunks are supplied with a swivel mounting and can be fitted at either the side or the rear. They are water and dust proof, do not rattle, and are suitable for any kind of tire or demountable rim.

★

The H. & H. Lighting Outfit, made by the E. A. Hammer Company, Cleveland, O., has been specially designed for use with Ford cars, so that the owner of one of these machines can have electric headlights, at slight expense. Current is taken from the magneto, the wiring being from magneto to lamp and from lamp to ground, the two lamps being wired in series. The outfit consists of a pair of parabolic reflectors, two tungsten bulbs, switch and wires with terminals and clamps. The reflectors are of the parabolic type, projecting the maximum amount of light from the lamps, and the sliding socket enables the latter to be placed in the proper focus of the parabola. The bulbs are fitted with the Edi-Swan or bayonet lock base, which does not jar loose or break, preventing the lamp from becoming disconnected or injuring the reflector. The filament of the lamps is tungsten, tough enough to withstand the strain of automobile work and giving a brilliant light which will show the road ahead for 600 feet at 25 miles an hour.

★

The Buscoba Spark Plug is made by the Bush-Scott Company, Detroit, and may be had in conical and petticoat types in .5-inch standard, S. A. E. standard, or metric sizes. The shells are full length and handsomely finished. When the plug is taken apart for cleaning the copper asbestos gasket is retained by means of a recess in the bushings, which are hardened to prevent bruising, adding to the life and service of the plug. The porcelains are accurately formed of a special heat resisting material and are interchangeable, with the caps well crimped in place and filled with cement to exclude oil and water. The sparking points are made of a special alloy which approaches platinum in its resistance to heat and the electric spark. The binding post and nut are so formed as take a great variety of cable terminals. The packing of the plug consists of asbestos filled copper gaskets of standard type.

★

The Geier Tire Chain Tool is sold by the Post & Lester Company, Hartford, Conn., and is used for tightening anti-skid chains. Those who have had trouble in applying these members on a wet day will appreciate this device, which makes it easy to bring together the ends of a chain for hooking. The tool is in two parts, both hooked to engage the tire chain. Depressing the handle brings the hooks on it and the movable arm together and in line, enabling the chain to be fastened.

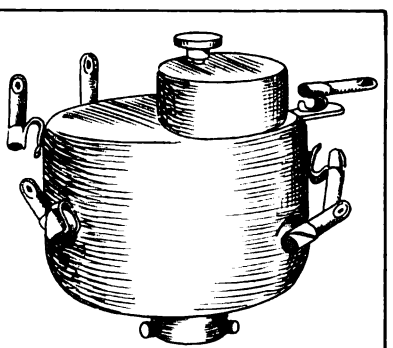
★

The Stanley Mixer is being placed upon the market by C. W. Jacob & Allison, New York City, and is a device to be located in the intake pipe above the carburetor. The construction is such that the incoming mixture rotates the coil and is itself set whirling, resulting in the gasoline and air being perfectly mixed before it enters the motor. All globules of gasoline are broken up and vaporized by passing through the mixer, resulting in increased power and fuel economy as well. The rotating member is made of stiff wire formed into a coil, within which is a pair of tilted propeller blades which whirl the device. The coil, or agitator as the maker calls it, is mounted on ball bearings and is very easily turned,

Digitized by Google

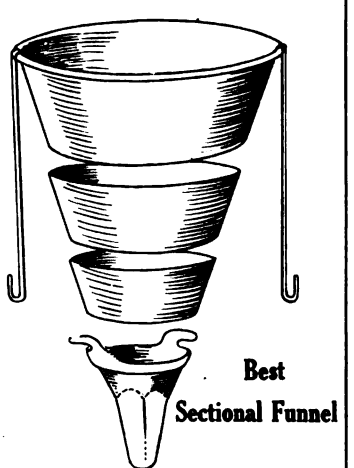
offering little or no resistance to the passage of the gases.

★



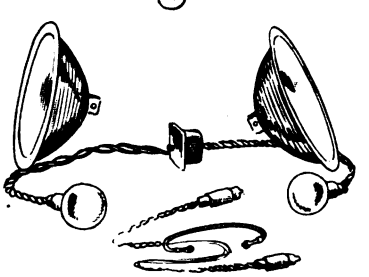
The Monitor Distributor is made by the Motor Specialties Company, Waltham, Mass., and is designed for use with a single unit coil, furnishing sparks to any number of cylinders. The distributor in combination with a six-volt battery, may be used instead of a high-tension magneto for ignition purposes at about one-tenth of the cost of installation. It is especially recommended for use on motors which run at high speeds. A feature of the construction is the shaft, which is of solid steel and runs through a very long phosphor steel bearing of perfect finish. This construction eliminates the fault of rocking or wabbling and secures a true and smooth running machine of long life. All the primary parts are at the top of the instrument where they are accessible by removing the cover. The contact is of a slightly wiping character, enough to keep the surfaces clean, and by means of a screw the duration of contact may be adjusted to suit the motor or coil. The body of the instrument is strong and impervious to water and oil.

★



The Best Sectional Funnel is built upon the collapsible plan, being in four sections which when nested fit in a circular box 7.75 by 2.5 inches, enabling the funnel to be carried in the tool box without waste of space. It is made by R. L. Best, Bismarck, N. D., of 26 gauge steel, nickel plated, and is inexpensive. The two arms seen hanging from the rim of the funnel engage with hooks on the spout when the funnel is in use, making it rigid. The arms fold underneath when the sections are nested.

★



The L. C. R. Lighting System is made by the L. C. R. Storage Battery Company, Dayton, O., and is designed especially for Ford cars. It consists of a set of parabolic reflectors to fit in the ordinary gas lamps, with wiring to connect the lamps with the magneto. The installation is an exceedingly simple one and does not need the services of an expert electrician. It adds little to the weight of the car, as no storage battery is carried, current being taken from the magneto alone without danger of weakening the ignition, it is claimed. A switch installed on the dash or wherever convenient, controls the lamps. The reflectors are parabolic, silver plated, with a flange which will fit beneath the wire ring that holds the glass in the lamp, so that it is easy to install them. The globes are of Mazda make with Edi-Swan base. The outfit comes complete with all connections, terminals and wire, ready to be installed.

Best Sectional Funnel

L-C-R Lighting System

Atkins Carburetor

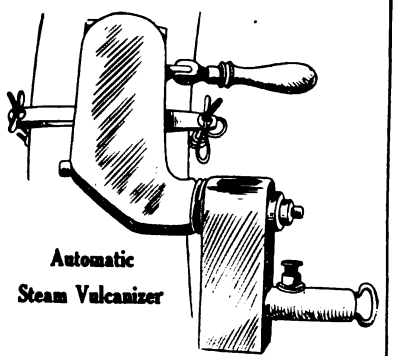
★

The Atkins Carburetor is made by the Atkins Manufacturing Company, Coldwater, Mich., and differs from other carburetors in that the float chamber may be located anywhere along the gasoline line as it does not stop the flow of fuel through the nozzle when the motor stops, but merely regulates the hydrostatic pressure on the nozzle. The float is thus not an integral part of the carburetor and is not shown in the illustration, which portrays only the carburetor proper, which may be placed in any position without affecting its operation. The instrument is very compact and is simple in action. The gasoline flows from the float chamber so placed as to furnish a gravity feed to the carburetor, and the throttle regulates this flow by increasing or diminishing the space around the nozzle. The throttle is connected to the lever seen between the toothed wheel and the body of the carburetor. Moving this lever moves the toothed wheel and the valve. The only adjustments are in the connection between the lever and the wheel, and the auxiliary air valve.

★

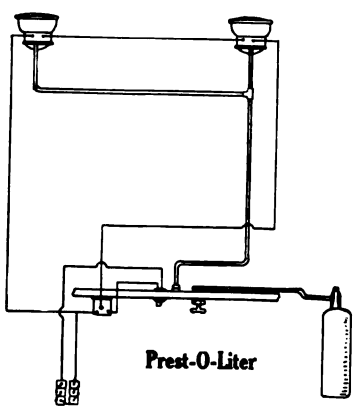
The Automatic Steam Vulcanizer is being placed on the market by the Simplicity Supply Company, Cleveland, O., and has been designed with the idea of produc-

Digitized by Google



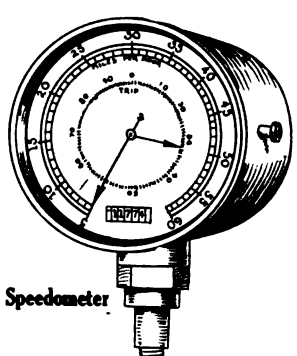
ing an apparatus as nearly automatic as possible, requiring no attention in vulcanizing. The device has no gauge or thermometer. To use it is only necessary to light the lamp, no watching or other attention being required. It will do all kinds of work, either on the wheel or off, from vulcanizing cuts and tears in the casing to patches on tubes. The outfit is small and compact, taking up little room in the tool box. The cover of the box forms a vulcanizing board which may be clamped to the running board of a car, or wherever convenient.

★



The Prest-O-Liter, made by the Prest-O-Lite Company, Indianapolis, Ind., makes possible the lighting, control and extinguishing of the acetylene running lights of an automobile from the driver's seat. It is made in three styles, for two headlights, two headlights and tail light and for two headlights, tail light and two side lights. The system consists of an automatic reduction valve attached to the gas tank, piping to the dash, controller valve for the dash, insulated burners with spark gap, spark coil and wiring. It is independent of ignition system, using separate battery and spark coil. The regulator valve, attached to the gas tank, keeps the pressure in the pipe line to the dash down to less than two ounces, so that there is no danger of an explosion as might be the case if the gas were under heavy pressure. To operate, it is only necessary to open the controller on the dash and push the button. This permits acetylene to reach the burners and produces a spark, igniting the gas. The handle of the controller is detachable, and the latter governs the gas so that any desired set of lamps may be lighted.

★



The Reliance Speedometer is made by the Reliance Speedometer Company, Boston, in a number of styles. It is of the centrifugal type, with an evenly balanced ball governor which makes the indication of speed steady. It is provided with speed and trip hands and a season odometer. The trip hand may be set to any desired reading by means of a screw. The construction of the instrument is substantial, with ball bearings at every point. Noise is prevented by the use of hard composition ring gears having cut teeth and running with a fibre pinion. Accuracy is secured by the fact that each instrument and dial is calibrated individually. The trip hand moves continuously. The finish may be had in brass, nickel, black, brass and black, or nickel and black. A feature of the Reliance installation is the swivel drive and ball bearing shaft. The drive is ball bearing, swivels, and is provided with spiral gears, insuring quietness and smoothness, and eliminating chances of breakage. The flexible shaft, provided with ball bearings, serves to give a steady drive, eliminating sudden jumps in the indication and also guarding against shaft breakage. A swivel is provided at each end of the shaft.

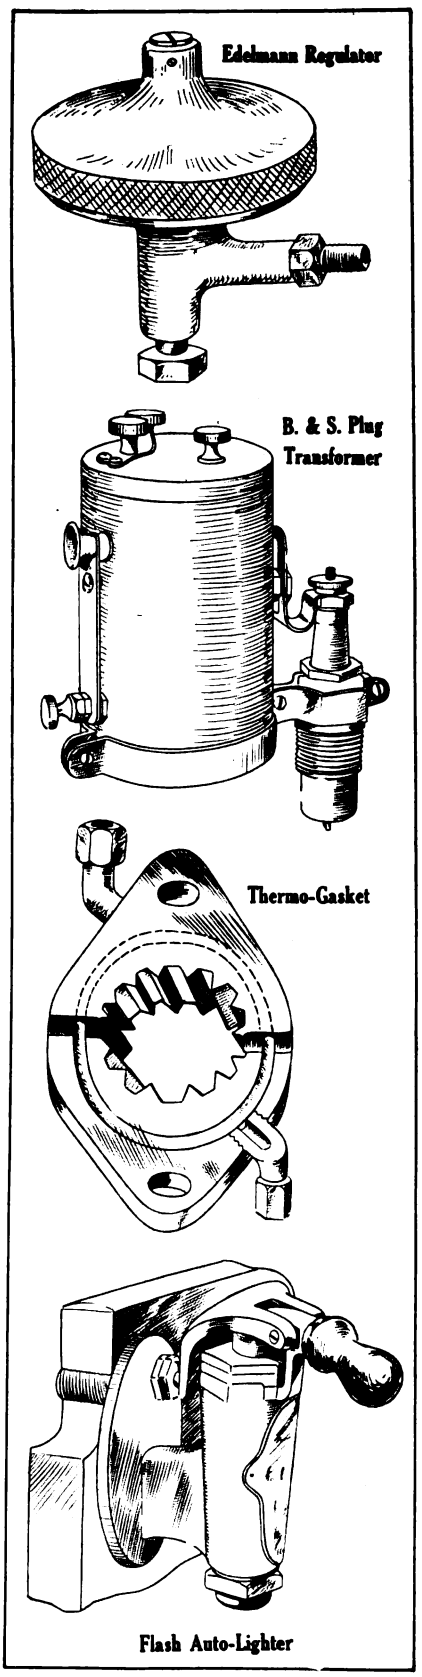
H. & H. Oil Gauge

★

The H. & H. Oil Gauge has been designed specially for use on Ford cars by the E. A. Hammer Company, Cleveland, O. It is attached to the bottom of the crankcase, and shows the amount of oil therein at all times. No drilling of the case is necessary to install the gauge stem first being inserted in place of the petcock with which the case is provided, and the petcock being located in the gauge itself. The gauge has been improved over the previous model produced by the company in that means have been provided for draining without removing it. It is turned from a solid brass bar, making it very substantial, while leaks are guarded against by leather washers. An improved air vent makes it positive in action, and the glass which is .125 inch thick and .75 inch in diameter, is easy to read and practically unbreakable.

Digitized by Google

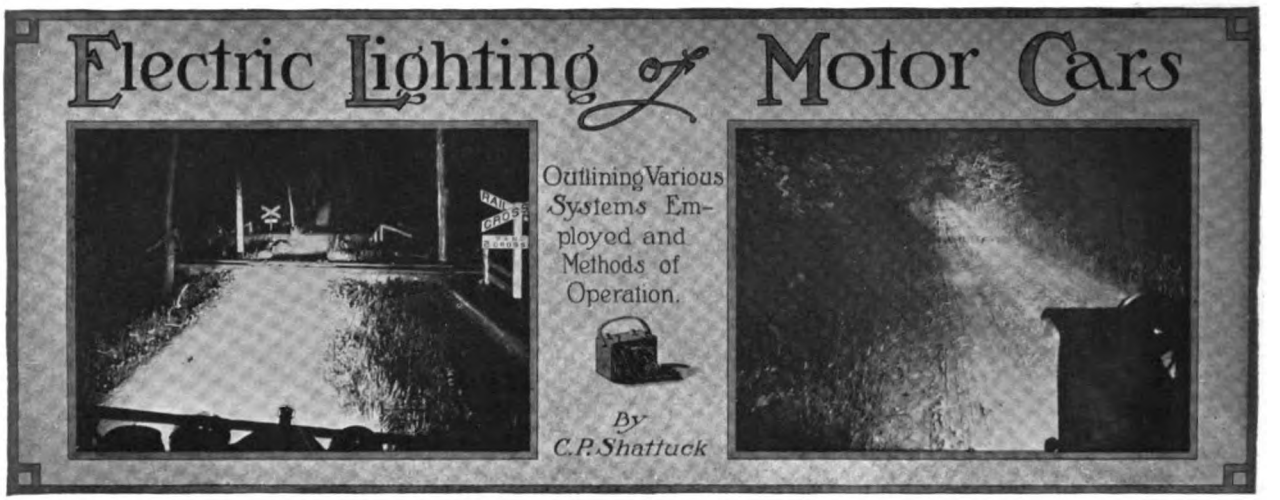


The Edelmann Regulator is manufactured by E. Edelmann & Co., Chicago, Ill., and is designed to be attached to pressure gas tanks, enabling the user to regulate the pressure of the gas delivered from the tank. It can be adjusted to deliver at pressures of from as low as two ounces, which is about the proper figure for supplying two .75-foot burners, to a pound or more, as desired. The regulator is made with a metal diaphragm which has long life. Adjustment is easily made by turning the screw in the cover.

★

The B. & S. Plug Transformer is made by the Briggs & Stratton Company, Milwaukee, Wis., and is a complete vibrating spark coil mounted on the spark plug without any secondary wiring to leak. It fits any spark plug and gives a hot spark with low battery consumption. The cost of a switch and coil is saved and the device is said to give better results than a box coil, the vibrator being very rapid and causing a shower of hot sparks at the plug point. Installation is easy, there being only one primary wire necessary, thus preventing mistakes in wiring. The vibrator may be adjusted readily, and at the same time the whole instrument is water, heat and oil proof. It may be covered with a protection hood if desired. Four types are furnished, two for mounting on the plug as illustrated, and two for mounting on the cylinder where convenient. The latter require a short piece of secondary wire from the coil to the plug.

★



The Thermo-Gasket is a combined heating and mixing device made by F. W. Battershall & Co., Albany, N. Y. Less than .5 inch thick, it is designed to be bolted between the carburetor and the intake manifold of the motor, taking the place of a hot water jacket on the carburetor and of a mixer. The construction is easily seen in the illustration. Surrounding the opening through which the mixture passes is an annular passage through which flows a continual stream of hot gas, led from the exhaust manifold of the engine through copper tubing. By this means the device is heated and the carburetor and intake manifold as well, the mixture as a result being made homogeneous, with all particles of gasoline thoroughly vaporized by the heat. An additional feature of the device which assists in mixing is in the diagonal fins which not only radiate the heat into the mixture, but impart a whirling motion to it.

★

The Flash Auto-Lighter is a system for automatically lighting or extinguishing acetylene headlights from the driver's seat, made by the Motor Specialties Company, Motor Mart, Boston. It comprises three parts, the controller, which is illustrated, an induction coil, and a pair of special burners. The controller combines a gas valve and an electric switch, the two being operated by the one lever. It is so timed that sparks are produced at the burners before the opening of the gas valve. The turn of the lever starts the sparking at the burners and admits the gas to the piping. The coil is of the ordinary single unit type, of high grade, finished in mahogany and brass and thoroughly guaranteed. In order that the lighter may be entirely independent of the engine circuit, the coil is provided with four terminals for the primary and secondary wires. The burners are made to fit any standard lamp and are provided with sparking points rigidly clamped in position over the gas vents. The points will not interfere with the light given by the burners, and will not be jarred apart by the vibration of the car. The lamps are lighted instantaneously, by a single turn of the handle to the left, and may be extinguished as easily, by a turn of the handle to the right. The lighter enables the lamps to be controlled as easily as the motor, so that they may be extinguished when stopping or driving on city streets, with resulting economy. With the outfit are furnished gas pipes, union fittings, wires, terminals, etc.

Part VII.—The Dynalux Dynamo System.

A DYNAMO designed especially for automobiles, having in mind the peculiar conditions and requirements under which a mechanical generator must operate successfully in this work, is the Dynalux, brought out by the Dean Electric Company, Elyria, O., well known maker of electrical apparatus. It is the result of exhaustive experiments that were conducted to perfect a device capable of developing a steady and constant production of electrical energy not affected by the variable speeds of the car. In designing the system the engineers have considered its utilization by those unfamiliar with electrical devices, their installation and operation, and claim for the Dynalux system a simple generator having but one working unit outside of the battery and lamps, dispensing with volt and ampere meters, magnetic regulators, complicated wiring, etc.

Its simplicity will appeal to motorists as the principle involved is similar to the straight storage battery system. Current to the lamps is furnished by one of these members charged by the dynamo which is connected to the battery by two wires without regard to their polarity. That is, to say: Either wire may be connected to the negative or positive terminal of the current container as the dynamo will always operate in the right direction. The leads to the lamps, signalling horn, etc., are by a separate set of wires connected to the battery, this arrangement eliminating the possibility of introducing high resistance connections in the circuit through wires jarring loose, and thereby causing high and destructive generator voltage to be impressed upon the lamp filaments. As the Dynalux dynamo maintains the battery in a fully charged condition and is a six-volt member, it is obvious that if lamps of similar voltage be utilized these cannot be burned out through excess voltage as above explained.

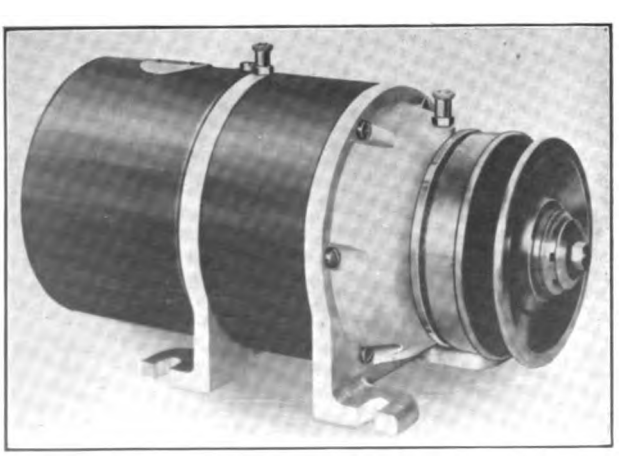

Fig. 44—The Dynalux Dynamo Equipped with a Declutching Device Preventing Excessive Speeds and Controlling Current Generated by Automatic Cut-In Device.

The dynamo is compact, occupying but little room, and its casing contains the automatic switch for connecting the circuit to the battery when the proper charging current is generated, as well as breaking the circuit when the speed of the generator falls below that required. The variable speed of the automobile is provided for by a declutching mechanism, also contained in the housing of the dynamo, and the devices and components of the generator require no attention whatsoever except oiling at stated intervals.

Lamp Loads.

The dynamo provides an ample output of current capable of supplying electrical energy for the largest automobile, and is designed to carry a lamp load as follows:

Two 21 candlepower headlights.
Two 4 candlepower side lights.
One 4 candlepower tail light.
One 2 candlepower dash light.
One 6 candlepower dome light.
One battery ignition system.
One horn.
One inspection lamp.

Additional lamps, such as pillar, running board, etc., may be operated without danger of overloading, as all of these lights are not drawing current from the battery at the same time. The latter will, how-

Digitized by Google

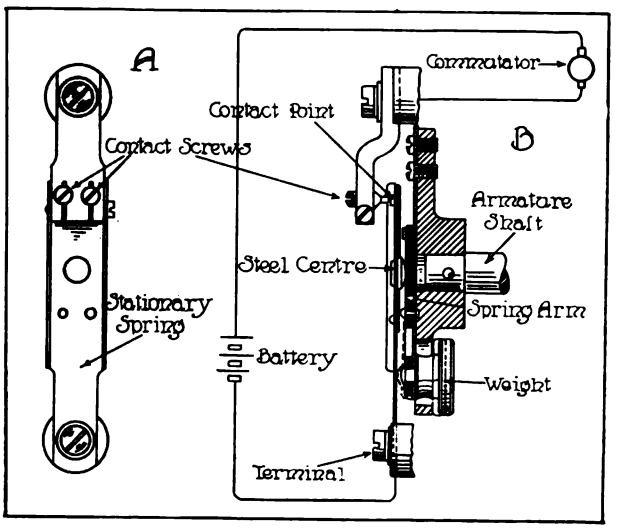

Fig. 45—Automatic Cut-In Device: A, Flat Steel Spring Carrying Contact Member; B, Outlining Principle of Operation by Centrifugal Force, and Relation to Armature Shaft.

ever, permit of the use of these members for a considerable period without overtaxing it as with a 120 ampere-hour battery employed with the Dynalux system, many hours' service is obtained even if the dynamo be inoperative. Lamps of larger candlepower may be utilized if desired, and the many hours of lighting that can be obtained from the battery alone may be computed easily.

For example: With the side and tail lamps, aggregating approximately 12 candlepower or 12 watts, these would consume about two amperes, and the battery would supply current for 60 hours. Even with a group of five lamps, including the headlights, the members could be burned about 15 hours continuously, or two nights. Another feature emphasized by the company is that the current supplied by the battery is steady and that flickering or variation in brilliancy is eliminated.

The Dynalux dynamo, which is presented at Fig. 44, is of the two-pole type, having a plain drum wound armature with a large commutator and ample sized brushes. The field is made up of fine laminations and the field windings are of the differential-compound type. It generates a direct current which is essential for charging batteries, is self-regulating, may be driven from the crank or camshaft of the automobile engine by gears, chain or belt, and its armature revolves at a fairly high rate of speed, the ratio being about three to one. If the armature were rotated at this speed when the motor of the car was operating at its maximum efficiency it is obvious that it would tend to destroy the commutator, and produce undue friction as well as noise in the bearings. To regulate or prevent the armature from attaining high ratios a declutching device is incorporated in a pulley which member actuates or imparts energy to the armature shaft. These members are outlined at Fig. 48, A and B, respectively.

Dynalux Declutching Device.

The former is a very simple arrangement and the result of much experimentation and is so constructed that continuous service does not affect its function. It consists of a star shaped flat spring member provided with four arms. It will be noted in the illustration that the ends of two of the springs are provided with heavy weights and that the remaining extremities are similarly fitted but with lighter members. The ends are bent at an angle so as to force the frictional surface of the clutch like member against the disc. The latter is keyed to the armature shaft and revolves with it. Referring to Fig. 48 B it will be noted readily that the clutch device and housing are a part of the pulley and rotate with the latter.

The tension of the star shaped spring member is so arranged or adjusted that the pulley will drive the armature shaft without any slipping until the latter attains a certain number of rotations; for example, 3000 revolutions a minute. When this speed is reached the heavier weights on the ends of the spring device force their respective spring arms into a straight line releasing the clutch member or breaking its contact with the disc on the armature shaft. The latter continues to revolve, however, because of the other two spring arms.

Slipping of Clutch.

There is a tendency for the clutch to slip at this critical speed and this is increased proportionately

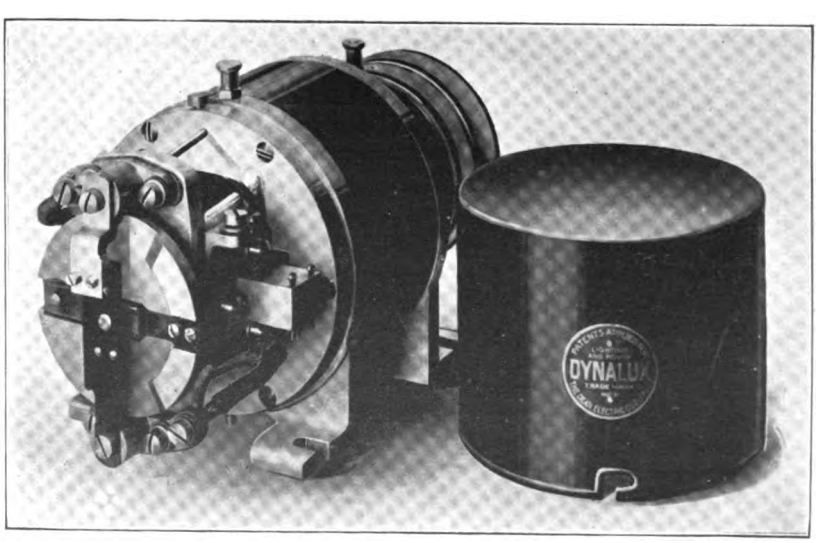

Fig. 46—Dynalux Dynamo with End Cover Removed to Show Accessibility of Commutator and Brushes, Also Brush Cords by Changing Which the Dynamo May Be Driven in Either Direction.

Digitized by Google

with that of the pulley until the centrifugal force is sufficient to cause the spring arms carrying the lighter weights to straighten out, when the pulley will revolve freely upon the armature shaft. Any further increase of the speed of the automobile simply rotates the free pulley, and it is obvious with such an arrangement that the armature and its ball bearings are protected from the destructive effect of excessively high speeds, which would be possible were the dynamo positively driven at ratios in excess of those of the crankshaft of the automobile engine.

The function of the different weighted arms on the spring members of the declutching pulley is to bring about an easy disengagement of this member with the disc actuating the armature shaft and gradually accelerate the speed of the latter when that of the pulley decreases, the arms moving into contact and bringing about the desired result. The operation of

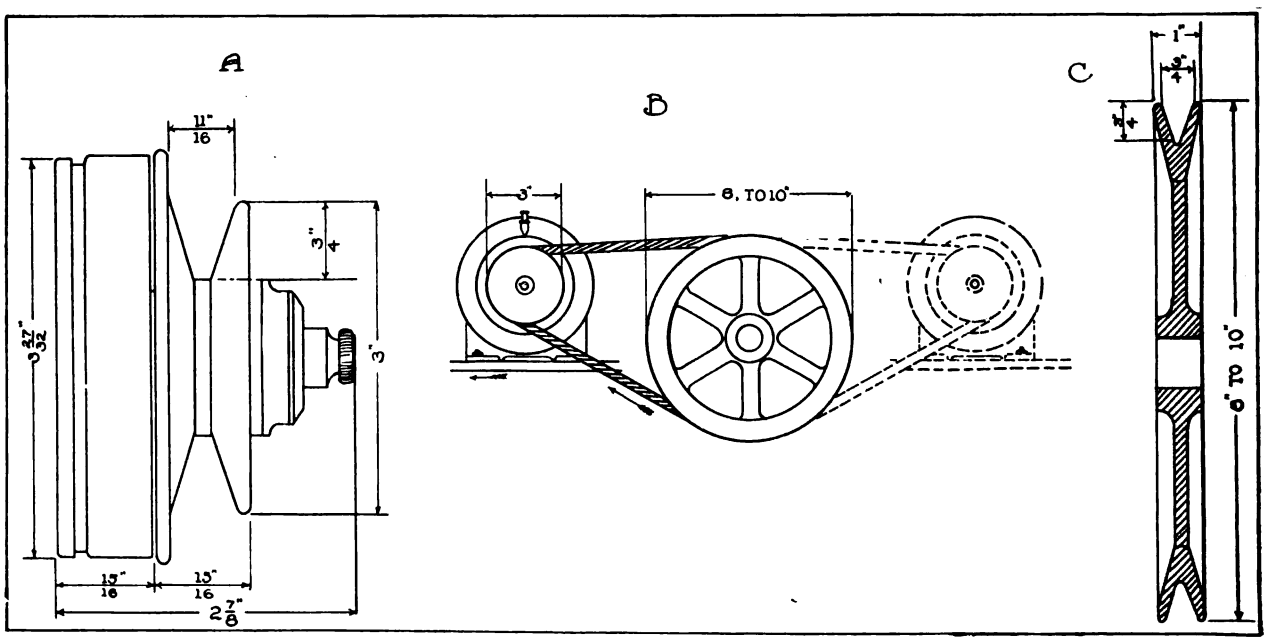

Fig. 47—Driving Mechanism of Dynamo: A, Depicting Driven Pulley and Its Relation to the Declutching Device; B, Method of Installation and Driving with Laminated Belt; C, V Shaped Pulley.

the declutching device is similar to that of the clutch of the motor car, with the exception that the Dynalux performs its work automatically without subjecting its components to stresses. The maker points out that this device is not subject to continual wear as with a constant speed armature with governing devices directly attached to the shaft and that the only friction is at critical speeds when engagement or disengagement takes place. The Dynalux generator is designed so that should the declutching device fail to operate the machine will withstand higher speeds, equally as well as other types not equipped with limiting devices.

Automatic Cut-In Device.

With any type of mechanical generator of electricity utilized to charge a storage battery or supply current direct to the lamps, it is essential that the voltage or strength of the current be controlled and not allowed to flow until a predetermined point has been reached, one in keeping with the battery. It also is necessary that the circuit be broken when the voltage of the battery is in excess of that of the current being generated by the dynamo, to prevent the former from discharging through the latter.

The automatic cut-in device utilized in the Dynalux system for connecting the generator with the storage battery is depicted at Fig. 45 A. It comprises a flat steel spring arm one end of which is attached to a disc which is keyed to the armature shaft as shown at B. The free end of the spring is provided with a weight which is so proportioned that it has a tendency to swing to the left when the centrifugal force reaches a point where it is sufficiently powerful to overcome its tension. The motion is imparted to the stationary part of the spring through the hardened steel centre. The former is provided with a pair of contact members on its free end, which closes the circuit against a pair of contact screws when the armature shaft attains a certain speed. When contact is made the current generated flows through its proper channels to the storage battery. The construction and adjustment of the cut-in device is such that when the dynamo develops a voltage of approximately 6.5 volts, the contact is made and the battery is in circuit.

It is stated by the maker that as the battery is approximately of this voltage, there will be no destructive arcing at these points when connection is made or broken. The governing mechanism is adjusted accurately at the factory, and after being tested its parts are locked securely. It is also claimed that the device will operate continuously without any at-

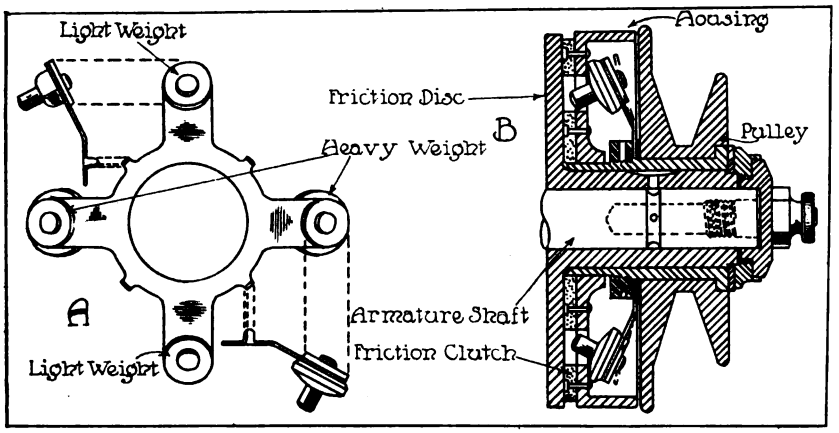

Fig. 48—Declutching Device Regulating Speed of Armature: A, Star Shaped Spring Carrying Light and Heavy Weights and in Contact with Friction Disc; B, Showing How Driven Pulley Is Engaged and Released.

tention whatsoever, being automatic in its action.

Current is collected from the commutator on the armature shaft by means of liberal sized brushes and these may be removed easily for inspection by taking out cotter pins on the outside of the brush holder, when the brush and spring may be completely withdrawn. These members and the cut-in device are located in the casing and are accessible by removing the cylindrical end cover which with the components is depicted at Fig. 46.

Method of Driving.

As previously outlined the Dynalux dynamo may be driven by gear, chain or belt, and in installing, it should be so mounted that there is no relative motion between the driving member and the supporting bracket, such as would be possible if the dynamo were mounted on the main frame of the automobile and the driving member on the motor proper. When belt drive is utilized adjustment must be provided as well as means incorporated for locking the same securely after setting. Spring tension is not suitable for taking up any slack in the belt in the type of drive recommended by the maker, which is a V shaped member of laminated chrome leather.

Its design is such, the maker maintains, that it will not jump off the pulleys in service, is not susceptible to water, oil or grit, and will withstand a temperature up to 160 degrees, Fahrenheit. Its laminations are riveted together so that the links may be removed to compensate for any slack and thereby keep the dynamo within the limit of about .75 inch adjustment. Fig. 47 B shows the details of the drive including the driving pulley as well as the driven member on the dynamo. The relative location of the declutching device and its relation to the driven pulley is outlined at A, and the diagram also gives the dimensions of these components.

Compactness of Dynamo.

In designing the Dynalux dynamo the company has taken into consideration the fact that the construction of many power plants of the motor car does not lend itself readily to the installation of a large sized machine. Therefore, it has sought to produce a simple and reliable dynamo which can be applied easily to existing models or fitted to new machines without altering or rearranging their mechanism. The dynamo and its outside dimensions are given in the diagram at Fig. 49 and it is stated that the weight of the instrument is slightly less than 18 pounds without pulleys. Its compactness will be noted, being 5.5 inches in diameter and about 10.5 long. All working parts are fully enclosed and protected against dirt, dust or water, and the material and workmanship throughout are of the highest quality.

High grade annular ball bearings are employed, of liberal size, these insuring long life and quiet operation. When mounted under the hood it is stated that it is practically noiseless. Each dynamo is assembled and tested carefully and it is claimed by the maker that its construction is such that the components cannot jar loose or its operation become affected by the vibration of the power plant or shocks produced when the vehicle is traversing rough roads.

Wiring and Installation.

One of the features of the wiring is its simplicity. It will be noted that but two wires lead from the dynamo to the battery, and as has been previously pointed out, these may be connected to either terminal of the latter. Provision is made for the operation of the armature shaft of the dynamo in either direction; that is, clockwise or anti-clockwise. This is depicted at Fig. 50 which shows the location of the two

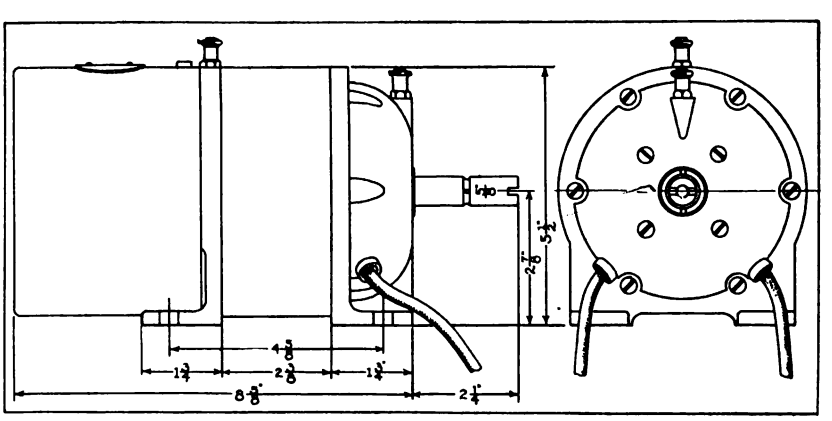

Fig. 49—Depicting External Dimensions of Dynamo Which Is Compact and Constructed of High Grade Material.

Digitized by Google

wires or brush connection members. These are colored green and black to facilitate identification. If the dynamo is to be operated in a clockwise direction, looking at the pulley end, the leads are connected as shown at A. If to be driven in an opposite direction the brush cords are attached as illustrated at B. This arrangement permits of installing the dynamo on either side of the motor and taking the drive from the crank or camshaft as desired.

The wiring diagram makes provision for a group of five lamps including two head, two side and a tail light, and by the utilization of a junction box it is possible to operate dash, inspection and dome lights as well as an electric signalling horn. It will be noted that the leads from the dynamo are connected directly to the terminals of the storage battery and not to the junction box or intermediate points in the lighting circuits. The latter are directly connected with the terminals of the battery, and the company points out that by this simple method of wiring danger of

sible short circuits, but can be attached neatly and securely to the chassis by metal saddles or straps.

Care and Maintenance.

The maker of the Dynalux claims that it is a very simple matter to remove the storage battery if a defect should occur in it, as it is not necessary to connect the wires in any predetermined direction, and the new battery will be charged properly with the leads from the dynamo attached either way. As a usual thing the automobilist is warned in advance of a reduction in the battery's capacity, affording ample opportunity to have the member overhauled and replaced. The commercial lighting battery is so substantially constructed that it will withstand the jar and vibration of motor cars for long periods without the necessity of removing it, except for overhauling, and at such times the car is not in service. By keeping the plates covered with distilled water, and observing the general rules of the maker, it is pointed out that storage batteries will give efficient service.

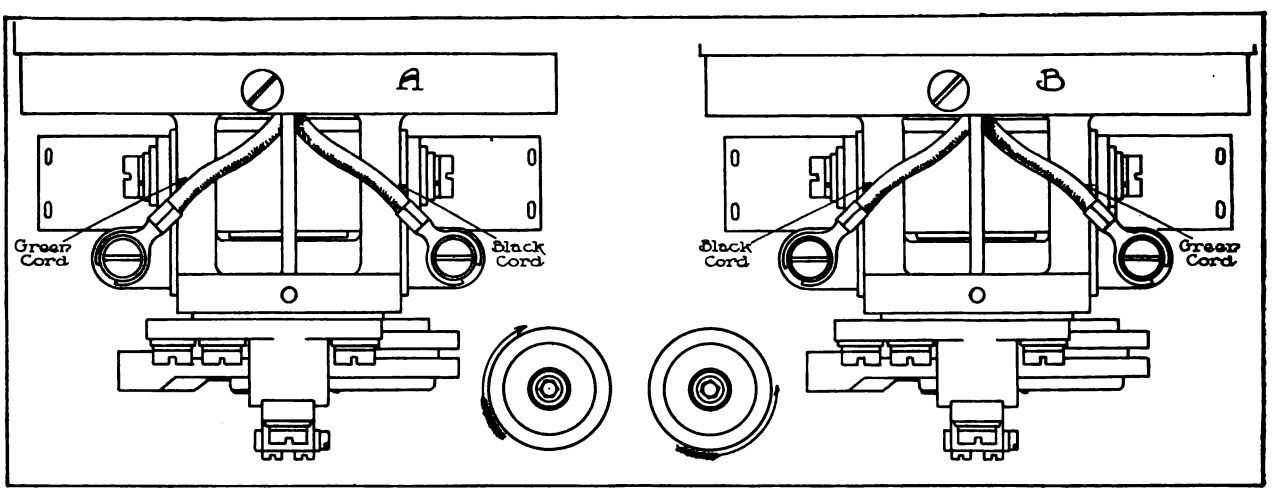

Fig. 50—Outlining Pulley End of Dynamo with Colored Brush Connecting Cords and Their Location When Armature Is Driven Clockwise as at A, and Anti-Clockwise as at B.

overloading the lamps is avoided. The lighting and other circuits of any standard approved design, such as are installed for the straight storage battery system, may be employed, this permitting the purchaser to wire his machine to best suit his requirements and to utilize any type of switch for controlling the lamps.

Battery.

The battery recommended for use with the Dynalux is one especially designed for lighting purposes, a 100 or 120 ampere-hour member, the latter being favored because of its greater reserve capacity for maintaining the lights for long periods when the car is not being operated. It should be of six volts and as with other electric lighting equipments the utilization of an ignition battery is not advisable, but the battery for furnishing current to the lamps may be used for ignition purposes. In connecting the dynamo to the battery the maker suggests the use of circular loom or similar material to convey the leads as the tubular conduit not only protects the wires and prevents pos-

If the automobile is to be run for any length of time without the battery in service, it is advisable to remove one of the dynamo brushes, so as to relieve the charging circuits from electrical potential, thereby avoiding possible damage from accidental short circuiting of the wiring of the car. The brush may be removed easily by taking off the cover of the dynamo and slipping out the retaining pins and brush.

The only possible adjustments are those of the contact points and commutator. If at any time the surface of the latter should become rough it can be polished quickly by holding a fine sandpaper, not coarser than 00, on the revolving member by means of a small, flat piece of wood. This is standard electrical practise. Emery paper should not be utilized as the grit will imbed itself in the copper of the commutator, acting as an abrasive and will rapidly destroy the brushes. Regarding the contact points it is only necessary to see that these members do not touch each other when the machine is not in operation

Digitized by Google

or when the armature is revolving at a speed slower than that required to charge the battery. However, these members are adjusted properly at the factory, and barring accidents on an overhaul of the dynamo, will not require attention. The Dean Electric Company guarantees the Dynalux against electrical and mechanical defects and claims that the instrument is so substantially constructed that it will outlast any car to which it is fitted.

(To Be Continued.)

IMPROVED HIGHWAYS FOR IOWA.

Iowa is planning to take an even more active part in the good roads movement in the future than in the past, and the boosters are co-operating with Illinois organizations. A meeting of delegations from various Iowa cities is to be held in June, at which representatives of points along Illinois roads which lead to Iowa will be present, and it is expected that the results will be seen in better highways between the two states. The Iowa Transcontinental Automobile Route Association is quite active, and expects to hold a meeting in Cedar Rapids in the near future.

WINS VERDICT FOR POOR ROAD.

A case of considerable interest to automobilists was decided recently in South Norwalk, Conn. H. G. Andrews of New York City sued the Connecticut town for damages to his machine caused by a poor road. It seems that in 1910, while driving over a road in South Norwalk, he suddenly ran into a rocky spot, and before he could slow down the machine it had been badly damaged and he and his wife, who was ill, were considerably shaken up. It was shown that he was driving with the proper care, and that the road was in such poor condition as to be dangerous even when great caution was observed by those familiar with it. A verdict was given for $350, the town being held responsible for the road and consequently for the damages of the automobile.

BRAZING AND SOLDERING.

The Norman W. Henley Publishing Company, New York City, has just issued a new booklet, "Brazing and Soldering," by James F. Hobart. This is a handy little book that will be of much value to both the amateur and the professional repair man. All methods of brazing are thoroughly covered, with the use of the apparatus, and details of special fittings which render the operation easier. The construction of a home made brazing furnace is described, and formulae for making brazing alloys of varying hardness are given. In that part of the book devoted to soldering all the methods and tricks of operation are described, detailed instructions being given. A part that should prove especially valuable is the section devoted to special methods for various jobs, such as on electrical wires, tin plate, galvanized iron and zinc, lead, aluminum, etc. The composition of solders is thoroughly covered, a large number of formulae for various work being given. Fluxes for different metals are also covered. The book contains many practical hints or kinks which make work easier or quicker. The company has also just issued a book by Thomas W. Poppe on House Wiring, covering all the particulars of wiring a house for electric lighting.

Opportunity is afforded in the accompanying illustrations to compare the construction of ambulances produced in Europe with those made by the leading manufacturers in America for export. The picture on this page presents the latest type installed with the fire department in Berlin, Germany, and it may be stated that this is the first installation of this character in the German capital. The other views depict machines recently shipped by the Pope Manufacturing Company, Hartford, Conn., and the Knox Automobile Company, Springfield, Mass.

It will be noted that the German chassis follows standard lines and is equipped with pneumatic tires of liberal dimensions, thus affording easy riding qualities. Of course, in this respect there may be little difference between the machines produced in America and abroad. The principal distinction between this vehicle and those of American manufacture lies in the body work and its appointments.

The German car is entered both from the side and rear. The illustration shows the method of removing the patient. Two cots are provided, one above the other, and space is left at the side for the surgeon and attendants. The rear door does not expose the entire interior, but only such portion as will admit of easy handling of the patient from the outside. The surgeon must utilize the side entrance.

With the Pope-Hartford ambulance, which is in service in Rio de Janeiro, Brazil, the roof and inside walls are finished in mahogany, with doors on either side and double doors at the rear. These latter have double locks, operated either inside or out, and each door has a plate glass window, beside those in the side walls. Ample room for the surgeon and attendants is provided and the arrangement of windows is such as to afford the fullest possible admission of light and air.

The Knox, which was designed especially for export, has two compartments behind the driver's seat, the forward end having a door at either side, also a folding seat for the use of the surgeon. This compartment serves as a side entrance to the rear end, and opens directly into the latter without an intervening door. Directly behind the partition at one side are two cots, one above the other, each supported on springs and each of the folding type adjustable to any angle. Below the lower cot is a large locker for the convenient storage of medicines, etc. Two folding seats are provided for the surgeon and attendants, and between them on the opposite side from the cots, is arranged a neat folding hot and cold water outfit, with sink and drainage to the outside of the car. The interior is finish in pure white enamel, and is lighted by electricity.

Afghanistan is shortly to join the ranks of the good roads countries, the Amir, who owns a large number of cars, having ordered the construction of some 10,000 miles of improved highways. It is understood that this new system will cover practically the entire country and involve considerable mountain work. At present there are hardly 10 miles of road in Afghanistan suitable for automobile travel, and it is not at all surprising that the Amir should have decided upon this undertaking.

★

Capt. Charles D. Hope, R. F. A., of England, has decided to utilize a trailer in making short tours in his Arrol-Johnston car during the coming summer. The trailer may not present an attractive appearance but Capt. Hope expects it will prove useful. It consists of a shallow box or tray mounted on two full elliptic springs which in turn are carried on a plain axle fitted with solid rubber tire wheels. The coupling is composed of two stout iron draw bars attached to the forward part of the tray and welded together at their converging point into a dowel pin which drops into an eyelet on the rear framework of the car.

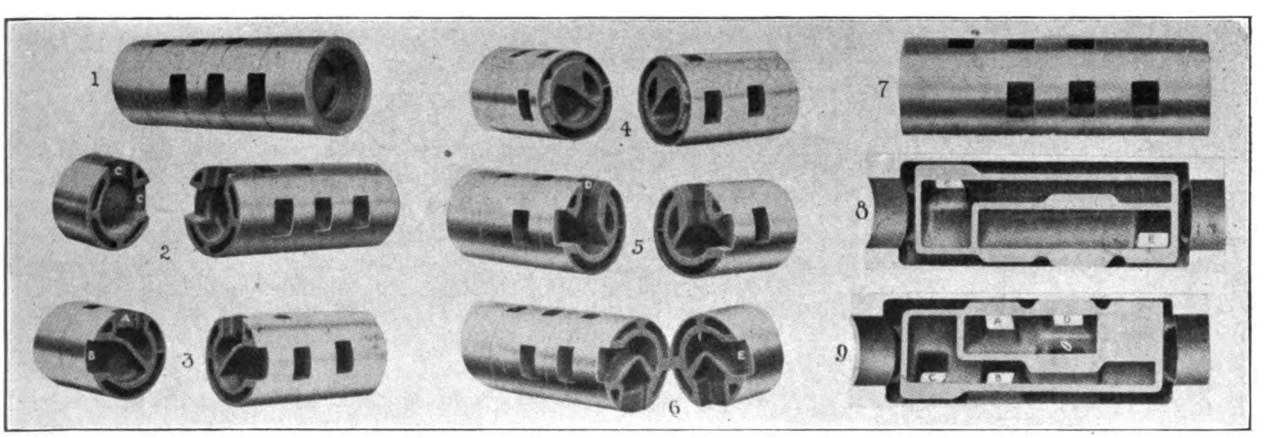
★

Another interesting rotary valve engine has made its appearance in England, the invention of E. J. Castiglione and a man named Bolton of Carlisle. The principal features are brought out in the accompanying illustrations, one of which presents progressive cross sections of one-half of the valve, this portion serving two cylinders only, the extension performing the same functions for the other two. The sketch outlines a part sectional elevation and plan of the motor.

Briefly, the idea of the design is to have a single rotary distributor serving all four cylinders in the usual manner, but a single rectangular port is provided at the top of each cylinder head, and valve pockets are done away with entirely. Thus there are four cylinders, provided with the usual ignition gear, with more or less hemispherical combustion chambers, and each with a single orifice through which the fresh gas must be taken and the exhaust expelled.

The purpose of the distributor, therefore, is to connect each cylinder with the intake and exhaust manifolds at the proper time in the cycle of operations, and this is accomplished by the rotary valve with internal passages. In the accompanying illustration, 8 and 9 show that there are three chambers within the valve itself, the outermost containing cooling water. A and B are ports which serve the same cylinder, registering in turn with the single port in the cylinder head. The holes C C both communicate with an exhaust opening in the casing, so that when B is registering with the rectangular hole in the cylinder head, C in the lower half is registering with the exhaust outlet. When the valve turns around so that A registers with the cylinder port the mixture enters through D, passes through the little chamber and into the cylinder. E is the inlet port for the second cylinder.

The view at 7 is that of the complete valve for the two cylinders. The same thing is true of the view at 1, except in this case the distributor has been cut into sections, which will be explained as follows: The section at 2 presents the exhaust ports and corresponds to C in 8 and 9. It will be seen that there is no dividing web on this section, the central opening being the end of the exhaust passage, which runs along the valve. Two ports are shown at 3, one communicating with the exhaust passage and the other with the inlet, these corresponding to A and B in 8 and 9. The view at 4 is a section between the ports and merely shows the passages. The two inlet open-



Digitized by Google

ings are to be seen at 5, one of these corresponding to D. The view at 6 shows the two openings for the last cylinder, corresponding to E.

The sketch not only presents the general arrangement indicating the method of rotating the valve by bevel gears, but shows the manner in which water is introduced. Attached to each end of the valve is a brass funnel shaped pipe, which runs through a gland into a pump supplied jacket. Lubrication is by means of small holes in the valve casing.

★

For the first time in the history of automobile racing, Knight engined cars will be pitted against numerous others employing the poppet type of motor in the French Grand Prix next month. Naturally the result will be awaited with considerable interest. The entrants include Daimler, Panhard and Mercedes cars, each equipped with the invention of Charles Y. Knight of Chicago. It may be added that the first trophy won by a Knight engined car was that taken by a Minerva in the recent reliability tour from Christchurch, New Zealand. Laurin & Klement of Austria has been added to list of Knight licensees, bringing the total for the Continent and Great Britain to seven.

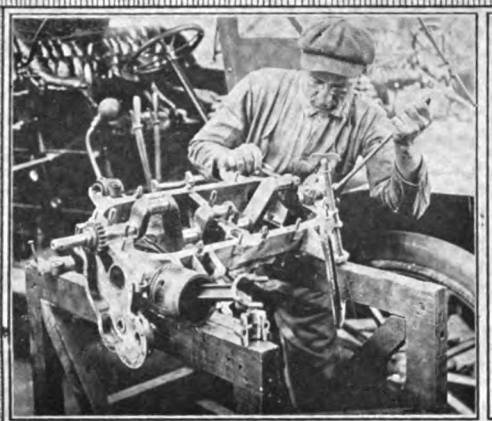
Sectional Views of the Distributor Valve in Castiglione-Bolton Rotary Valve Motor Recently Brought Out in Great Britain.

★

The Benz and Daimler firms in Germany have been disputing the honor of producing the first gasoline automobile. The trouble was started March 4, when the Daimler works at Untertuerkheim closed down to celebrate the 25th anniversary of the gasoline car, a Daimler, of course. The Benz people protested that the anniversary was two years late, and that the first gasoline machine was not a Daimler, anyway, but a Benz. According to this concern, the first automobile left the Benz factory in 1885, and is now in a museum in Munich, with copies of its patents, issued in 1886 and 1887. This antedates the first Daimler by two years, Gottlieb Daimler having driven his first car March 4, 1887, although two years before that he had driven a tricycle by means of a gasoline motor.

SCIENTIFIC AUTOMOBILE LUBRICATION.

An interesting and important contribution to the subject of correct automobile lubrication is to be found in a booklet recently published by the Vacuum Oil Company, Rochester, N. Y., maker of Gargoyle Mobiloils. Following the policy of this concern in adapting the lubricant to the condition under which it operates, this maker has spent considerable time in studying all of the cars constructed in America, as well as the foreign machines sold here, special attention having been paid to the matter of fitting piston rings, feed systems and other mechanical factors which enter into the matter of selecting the type of oil best suited to the needs of the particular motor.



This investigation showed the necessity for several grades of oil to provide the most efficient lubrication for the varying types of cars. In order to furnish this information in concise form, a complete chart of recommendations has been prepared, setting forth the exact grade of Mobiloil which will best meet the needs of any given machine. This covers all makes and models from 1908 to date, and the information has authoritative backing, coming as it does, from the concern which supplies lubricants not only to automobilists, but to three-fourths of the battleships and ocean liners afloat. A copy of the booklet and chart may be obtained by addressing the New York office of the company at 29 Broadway.

CARNEGIE SCHOOL ADDS AUTO COURSE.

The Carnegie Technical Schools at Pittsburg, Penn., have added a course in automobile engineering to the curriculum. The new department will be under the dean of the School of Applied Design, and will be conducted in Machinery hall, a large building now under process of construction.

Advocate the use of lights on all vehicles using the public ways during the hours of darkness.

MECHANICAL NOTES FOR OWNERS

Methods of Simplifying the Care and Maintenance of the Car, Discussion of Pertinent Facts and Notes on Operation.

EFFECT OF AIR UPON MIXTURE.

Of the important components of the power plant the carburetor is, perhaps, more often blamed for irregular operation of the motor than any other, particularly at low speeds. The average motorist desires that his car shall operate smoothly when the motor is throttled down to a few miles an hour as when in heavy traffic on the high or direct drive, as well as have plenty of power when driving at high speeds on the country roads. In changing gears the speed of the motor is an important factor, and with some cars

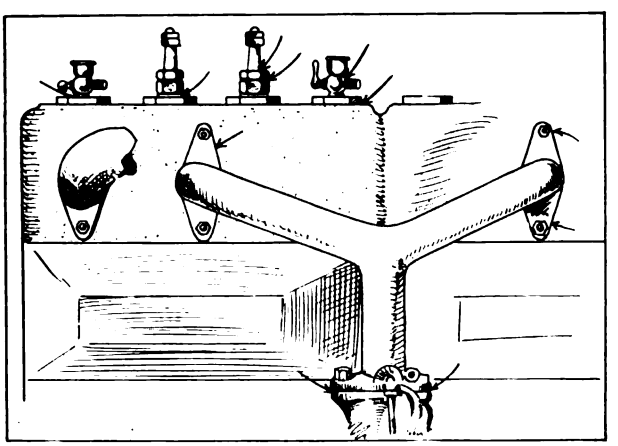

Fig. 1—Outlining How Auxiliary Air May Be Present, and Possible Causes of Lost Compression.

it is difficult to shift from first to second or come from high into the second or low without a clashing of the pinions, if the motor cannot be throttled so as to overcome the inertia of the flywheel.

It may be that the carburetor is so adjusted that the motor will throttle nicely, but upon higher speeds there is too rich a mixture, causing heating and faulty operation. And if the vaporizer be adjusted to the higher speeds the motor may skip at low, in which case misfiring disappears when the throttle is opened and the speed of the car is increased. Under such conditions the motorist is prone to condemn the carburetor.

When a car is new and the carburetor adjusted properly the motor will throttle nicely and respond to acceleration. In time and so gradually that it is hardly perceptible, wear takes place where the valve stem comes in contact with its guide and bushing, allowing auxiliary air to enter, and the mixture is weakened thereby particularly at low speeds. The amount of mixture drawn into the cylinder depends in addition to its size, upon the suction of the piston. If the latter and its rings fit properly and no leaks exist, the cylinder will receive a full charge of vapor.

When the mixture is being drawn in the exhaust valve is closed and the vapor passes from the carburetor through the intake pipe into the cylinder when the intake valve is open as depicted at Fig. 2, which also shows auxiliary air passing between the valve stem and guide, a condition due to excessive wear. Under these circumstances the mixture is diluted and it is obvious that unless the carburetor be adjusted to supply additional fuel the operation of the motor will be affected. The mixture will be too rich at high speeds although if the carburetor be provided with double jets it may be set to compensate for an ordinary amount of auxiliary air.

If the bushings are removable new ones should be fitted and the valve stems trued up. If the latter are worn badly it will be advisable to fit new stems and bushings. Where the guides are integral with the cylinder these will have to be rebored and new valve stems turned out to fit. At Fig. 3 is shown a method of repairing a leaky member. It will be noted that auxiliary air passes between the valve stem and guide, the arrows and dotted lines showing air being drawn in and the space caused by wear.

A method of preventing the admission of air and one that has the advantage of being adjustable, is presented at B. The guide member is threaded to take a cap or stuffing box which is fitted with a well lubricated packing compressed into the recess of the guide, and when this is expanded it closes the aperture. One

Digitized by Google

will be required for each cylinder and if the exhaust leaks badly it can be similarly treated. The latter, however, does not affect the mixture as the valve is on

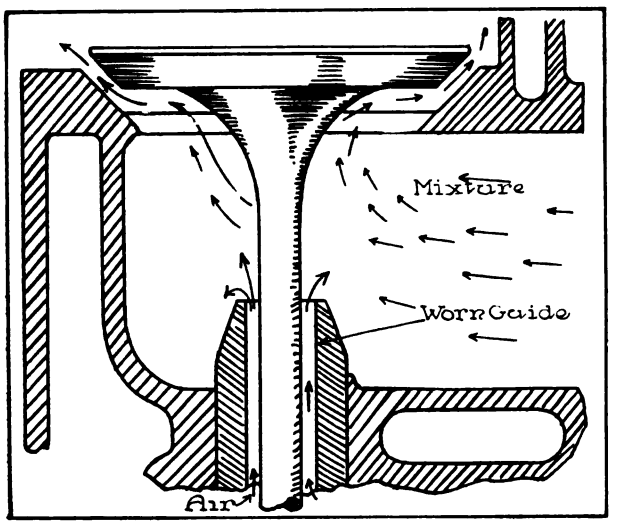

Fig. 2—Worn Valve Guides and Stems Allow Auxiliary Air to Weaken Mixture Causing Erratic Operation of Motor at Low Speeds.

its seat when a charge is being drawn into the cylinder.

Other components may allow auxiliary air to reach the mixture such as the connections between the carburetor and the intake manifold as illustrated at Fig. 1. In removing the vaporizer for cleaning or repairs, and if an asbestos gasket has been utilized and fastened with shellac, the material is apt to become damaged in the operation. If the carburetor be replaced without making a new gasket and is not snug, air will find its way as shown by the arrow in the drawing. The point at which the intake manifold is attached to the cylinders is another place where auxiliary air may enter if the connections are not tight.

While dealing with the effect of auxiliary air upon the mixture the loss of compression because of improperly adjusted spark plugs, valve caps, etc., should be considered. In cleaning a badly sooted plug some motorists make it a practise to dismantle it and in the reassembling fail to get the member gas tight. Valve caps may leak although apparently screwed down tightly. The priming cups threaded into the valve cups may disclose a leak when tested. If several of these members leak the compression of the motor is affected as well as power impaired.

These parts may be tested by filling with oil the crevices indicated in the drawing when the motor is running. If any leaks exist they will be noted by the lubricant bubbling. The loose members should be set up and again tested until tight. Shellac should not be employed to make tight joints as the parts are liable to freeze and make removal difficult. Graphite or some material not affected by the heat is best and may be employed on gaskets which will permit the latter to be taken off without injury.

HANDY HOME MADE GAUGE.

There are a number of tools about the garage which may be converted into useful members after they have become broken. Old files are made into bearing scrapers, or cotter pin extractors, etc. Very few owners save broken hacksaw blades, especially if the pieces be small, but even these may be converted into a handy tool. At Fig. 4 is outlined how a motorist utilizes a small piece of an old hacksaw blade. The piece was about 1.5 inches, and upon measuring its thickness it was discovered to be exactly .03125 inch.

This was the right gap for the spark plug and was employed when setting the points as shown at C. The motorist also noted when adjusting the lift of the valves that the space between the tappet and valve stem was .03125 inch so the tool served for adjusting these members without utilizing the marks upon the flywheel. As his car was equipped with a magneto, it was essential that a rule be employed in setting the gap of the magneto plugs. This was solved by grinding one section of the blade to .015625 inch, as indicated at B. The rough ends were smoothed up on an emery wheel and the teeth removed. The device could be drilled so that it might be attached to the key ring. It is further suggested that two or more of these members could be fastened together which arrangement would provide a measuring gauge ranging from .03125 up to .125 inch.

FITTING DEMOUNTABLE RIMS.

The practicability of demountable rims appeals to many motorists who are changing over their wheels, a process which may require the building up of the felloe or some slight alterations. In removing and

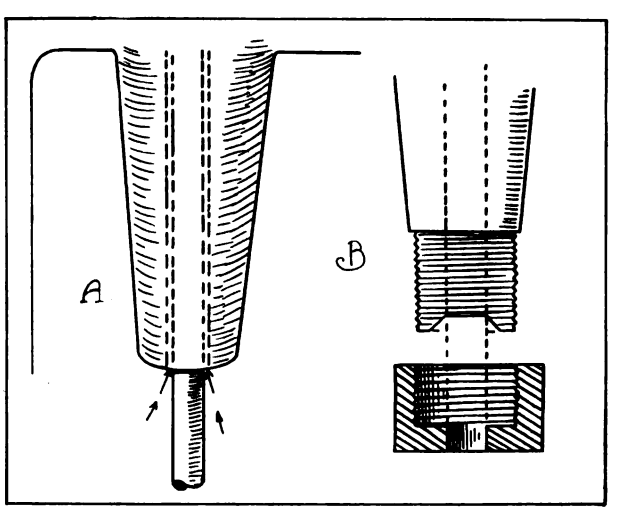

Fig. 3—How Valve Guide Integral with Cylinder May Be Fitted with Adjustable Stuffing Box Device.

fitting the new members the new wood is primed; that is, given a coat of filler material by the blacksmith or wheelwright. The color is usually pink which does

Digitized by Google

not harmonize with the finish of the automobile.

It is not necessary to send the wheels to a paint shop as the work may be performed by the operator. The priming coat is first covered by a coat of lead which, when dry, is smoothed up with curled hair, after which the color varnish is applied and finally one or more coats of finishing varnish. These materials may be procured at any carriage paint shop to which the car should be driven so that the head painter will be able to match the colors. Before applying the finishing varnish the rubbing coat should be treated with curled hair. Sufficient time should elapse between each coat to insure that the material has become hard.

FITTING NEW BRAKE LININGS.

In time brake linings wear until they will not grip properly even when adjusted to their limit for expansion. It then becomes necessary to replace the

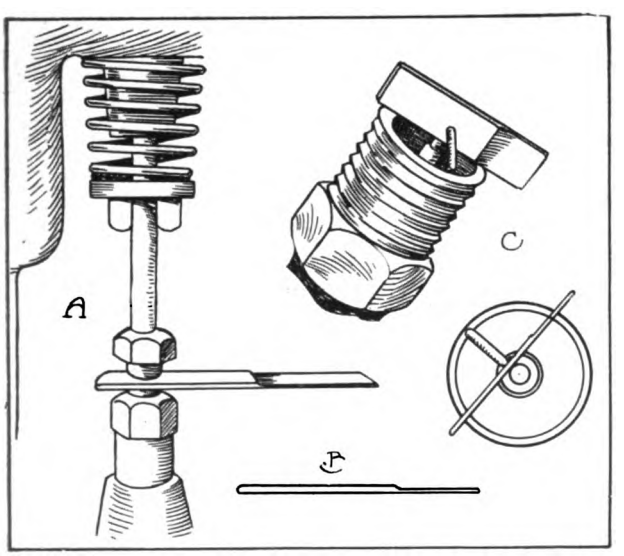

Fig. 4—Combination Measuring Tool, Constructed from a Piece of Old Hacksaw Blade and Depicting Some of the Uses to Which It May Be Put.

worn material with new, and while this may appear to be a simple operation it is one requiring attention to small details usually overlooked by the novice. When the wheel drums are constructed for internal expanding and contracting brakes, the thickness of the friction material utilized for the expanding members should be ascertained before purchasing.

If this information cannot be secured the space will have to be measured and before this is attempted the brake pull rod should be disconnected so that the expanding cam is in normal position. It should be remembered that the brake has been adjusted to obtain the maximum leverage of the cam and that a readjustment will be necessary with new linings. In measuring for new lining allowance should be made for clearance between the material and the brake drum when the friction bands are in a normal position.

The lining varies in width from one inch by quarters to 2.5, and is also made three and four inches. The thickness is .125, .15625, .1875 and .25 inch, the intermediate sizes being most generally used. To remove the old lining the brake band should be gripped in the vise and the peined over rivet heads cut off with a cold chisel, taking care to hold the latter so that the rivet will be cut off close to the brake band yet not cutting the latter. The rivets may then be driven out with a punch although they usually will come away with the lining.

In fitting the new lining it should not be wider than the band and should be lined up on the band before drilling the material for the rivets. Soft copper rivets, about the thickness of the lining and band should be used. These are inexpensive and a few cents will purchase enough for several sets of brakes. The lining should be countersunk deeply so that when the material wears the heads of the rivets will not be exposed, as these members will not produce friction enough to hold the wheels. The rivets should be driven in hard and peined over on the underside of the band. By gripping a punch in the vise and resting the head of the rivet upon the punch, the copper may be peined easily without the rivet slipping back and the lining will be drawn snugly upon the band at the same time.

In replacing the bands the springs should be examined and if these have lost their elasticity should be replaced with new members. In adjusting the brake pull rods they should be set so that the brakes grip firmly and hold the car but not so that they bind and heat the drums. The latter should be examined after a short run to note if undue friction be taking place. The contracting type of brakes does not require other attention than to see that they do not bind. The external type is easily taken care of and adjusted without trouble.

TREATING CORRODED TERMINALS.

The general use of magnetos is apt to make the present day automobilist careless regarding the storage battery when this member is utilized for starting purposes. Some types of storage batteries are more liable to sulphuration than others, this depending upon their construction and method of placing in the car. An instance of failure to start upon the battery, although it had been charged but the day before, was noted by the writer recently.

The owner had been cranking for some time and had the floor board out and hood raised searching for a short circuit or loose connection. The leads appeared to be intact and the battery when tested with a voltmeter showed six volts. The leads to the battery were also snug and the outside of the terminals were fairly clean. Upon removing these members they were found to be corroded, preventing the current from flowing because of the non-insulating accumulation. When scraped, cleaned and replaced, the

Digitized by Google

motor started on the switch. Storage battery terminals should be examined from time to time, cleaned and covered with vaseline or some acid resisting material.

DANGER OF GARAGE GASES.

Owners who have objected to the cold and barn-like atmosphere of their garages and wanted to close doors and windows should take heed of the case of James Bavaird in Eau Claire, Wis. He was found suffocated in a barn which he used as a garage, the atmosphere being full of carbon monoxide and dioxide.

It appears he had gone into the barn to repair a tire and had left the engine running, probably for warmth. Working close to the floor, the gases, which are heavier than air and had accumulated there, asphyxiated him, with two cows and 50 chickens. The gases finally became so thick and the oxygen so reduced that the motor stopped.

All garages should be well ventilated, and provision should be made to take air from the floor as well as the ceiling. Many a man who feels sleepy while working under a car and lays it to the fact that he is lying on his back, is under the influence of the gases from the motor.

CAUSE OF MYSTERIOUS KNOCK.

An owner was annoyed by a mysterious tapping sound in the motor and although he made a diligent search, failed to discover the cause. Taking the machine to an expert the latter was puzzled for a short time until he noted that one of the plugs was of a different type than the others. In questioning the owner it developed that he had tried the plug upon the advice of a friend who recommended the use of a long barreled member so that the spark would take place well down in the cylinder. The plug was removed and it was found that the valve just touched when at the top of its lift. A new plug was fitted and the tapping noise eliminated.

CARING FOR CHAMOIS.

A piece of chamois such as is used for polishing bodies, is somewhat like a razor strap in having to be worked in before it reaches its efficiency. A new skin is full of an oily substance, and will leave a fine fuzz on the body. For this reason it should be used first on the running gear, with which one is not so particular as with the body.

RENOVATING FELT WASHERS.

Felt washers are utilized in numerous places about the car to prevent lubricant from leaking out. In time the material becomes hard, especially if in contact with a moving part. Rear axles are usually fitted with felt washers to prevent the oil or grease from working out from the differential housing to the road wheels and when the packing becomes worn the lubricant not only spatters over the wheel and tire but affects the operation of the brake. The best method is to fit new washers but if the old ones be not worn badly, they may be renovated by soaking in gasoline to restore their elasticity. In fitting new members they should not be too snug as the part is likely to become worn.

NO ADVANTAGE IN PEROXIDE.

Some time ago a British chemist stated that two ounces of peroxide of hydrogen to every pint of water used in the acetylene generator would increase the illuminating power of the gas by 50 per cent., due to the oxygen from the peroxide aiding combustion. This theory has now been exploded, another chemist, V. B. Lewes, gas examiner for the city of London, having conducted a series of tests, burning acetylene under various conditions, in different burners, with varying pressures, and with and without oxygen, the illumination being measured in each case. Besides stating that the oxygen does not increase the illuminating power of the acetylene, Prof. Lewes called attention to the fact that the mixture is exceedingly explosive.

SELECTS SAMPSON VEHICLE.

The Chase Rolling Mill Company, Waterbury, Conn., said to be one of the largest brass manufacturing concerns in the world, has been experimenting with industrial transports for a number of years. In fact, it is believed that this company was the first user of motor trucks in that city. Its plant is located on top of a long hill, reached over vitrified pavement from the centre of the city, and the problem of haulage is one which has given G. L. Summey, chief engineer, considerable study. After spending some $7000 and three years in time he has decided upon a Sampson, made by the Alden Sampson Manufacturing Company, Detroit.

HENRY MOTOR CAR COMPANY SOLD.

The Henry Motor Car Company of Muskegon, Mich., has been sold and the manufacture of Henry cars will be discontinued. The cars on hand in the factory were purchased for $9000 by Sachsemmaer & Levine of Philadelphia, while the repair parts and good will were purchased by the Muskegon Automobile Company, so that Henry owners will be able to get spare parts, additional security being given in the fact that A. R. Palmer, formerly with the Henry company, is now connected with the Muskegon Automobile Company and will look after the interests of Henry owners.

THE AUTOMOBILE JOURNAL

VOL. XXXIII. MAY 10, 1912. NO. 7.

Published the 10th and the 25th of Each Month.

William H. Black, Treasurer. D. O. Black, Jr., Secretary.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 W. 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurian, 4707 Magnolia Ave.
BOSTON—John W. Queen, 6 Beacon Street.

Subscriptions:

The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Ten cents the copy.

Advertising Rates:

Information given at request. All advertising copy to insure publication must reach this office 10 days preceding the date of issue.

Remittances should be made by Check, Draft, Postoffice, Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

IMPROVED ROAD SITUATION.

The report of the office of public roads, Department of Agriculture, which was presented in condensed form in the last issue of The Automobile Journal, proves of decided interest to the motorist. It shows that in 1904 there were 153,608 miles of improved ways out of a total mileage of 2,151,379, while in 1909 the figures were 190,489 and 2,199,645, respectively. The gain in good roads for the five years was approximately 40,000 miles, or at the rate of 8000 a year.

Obviously, the statistics for the latter year are by no means suitable as a basis upon which to compute the present situation, since it is probable that the increase represented in the last two years is more than sufficient to offset the gain covered by the report. Certainly, this should follow when it is remembered that automobile owners have been contributing liberally, in the form of special registration fees, for this particular object.

Let it be assumed for the sake of argument that the gain in 1910 and 1911 was only proportionate to that of the preceding five years, and there are today some 210,000 miles of improved ways in this country, out of a total mileage approximating 2,200,000. This means a percentage of about 9.5. As it is known that many states have been expending largely increased appropriations for this purpose, it is not unlikely that the percentage is nearer 15, giving about 230,000 miles. Very possibly, this latter figure is far below the actual total.

In this connection it is of interest to note that the American Automobile Association is in receipt of reports which indicate that work of a good roads nature will be done this year on something over 1,000,000 miles of highways throughout the country. Obviously, this is not all to be of a so-called permanent character, but it indicates that practically 50 per cent. of the total mileage is to receive treatment, and largely because of the activities of motorists.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

NEW METHOD OF TAXATION.

Chicago appears to have caught the motorists off their guard, in that a new ordinance was passed March 4, going into effect May 1, under which a wheel tax is imposed on automobiles as follows: For cars of 35 horsepower and under, $10 a year; over 35, $20; electrics, $10; motor trucks, under one ton capacity, $15; over one ton, $30. No hearing on the proposed ordinance was given, and the first intimation the motorists had of the matter was an announcement a week before the new fees went into effect.

The city had a wheel tax based on seating capacity, under which vehicles capable of carrying more than two persons were compelled to pay $20 a year, and others $12. The new ordinance was passed under authority gained by a statute enacted by the legislature last July. Apparently, the motorists neglected to watch the legislators while at work, or else they worked as quietly as the city officials.

Other cities have wheel taxes, but so far as is known Chicago is the first to differentiate between automobiles and other vehicles. This appears to be an entirely new method of securing revenue from the motor car owners. The situation in that city would indicate that organized motorists must be even more diligent than ever in watching proposed legislation.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

Digitized by Google

DISCUSSING THE SHOW PROBLEM.

Those who have watched the attempts of certain cities to secure the support of the National Association of Automobile Manufacturers in the holding of so-called national shows in the fall, cannot help but be impressed with the fact that promoters have been dealers in almost every instance. The makers appear to be inclined toward the opinion that they have quite enough to occupy their time and attention in making preparation for the two exhibits in New York and Chicago. It would appear, therefore, that if there are to be any large displays earlier in the season they must be conducted by local dealers, relying upon such financial support as they are able to get from the producers of the cars which they represent.

There is little doubt that the so-called minor show circuit, which has reached large proportions during the past two years, has had a decidedly stimulating effect upon business in many of the centres throughout the country, and it is probable that more of these will be held earlier in the season another year. Just what effect this will have on the main exhibits, those staged by the manufacturers themselves, is somewhat problematical. It would appear that the whole show situation was undergoing a decided change. Meanwhile, France and some of the other foreign countries, which had abandoned the national show idea, are planning to revive the proposition again this year. The industry seems to demand these annual displays and their elimination is not to be undertaken without careful consideration.

Universal lighting means the safe use of public ways at night. It need not inflict unreasonable restrictions on anyone. Why not follow Massachusetts' example?

TRANSCONTINENTAL TOURING.

The American Automobile Association, which, it will be admitted, ought to be in a position to determine with some degree of accuracy what is expected in the way of touring, estimates that something like $1,000,000 will be expended by motorists in crossing the continent. Of course, this is but a small percentage of the business that will accrue to American enterprises through touring during the year.

It is significant that many of the western states are beginning to realize the importance of encouraging automobile visitors. Many of these dollars have been expended on the Continent of Europe in the past, largely because the American people have not seen fit to encourage touring at home. Until within the past year, New England and the East were alone in their attempts to interest the motor tourist.

But with all this increased activity with respect to good roads and advertising for tourists, comes the suggestion that there is even more need for uniform motoring laws. Boards of trade and other commercial organizations interested in securing tourist trade, should look into this situation and become prepared to assist organized motorists in procuring the necessary action when the legislatures begin their work next winter.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

MISSISSIPPI AND MASSACHUSETTS.

Although motoring has been a frequent subject of legislation since the practicability of the self-propelled vehicle was established, some of the laws that are being passed today offer plenty of indication that legislators are decidedly unfamiliar with what is needed in this respect. Mississippi has never had an automobile law, but will have one beginning June 1, in which "the owner of any automobile, locomobile, oldsmobile or other four-wheeled vehicle propelled by gas, steam or electricity" must pay registration fees varying from $5 for cars of 25 horsepower and under to $25 for those of over 50 horsepower.

Of course, the wording of the statute betrays a surprising lack of information concerning the automobile industry, but after all it is hardly less in keeping with the progress of the times than the attempt of the sub-committee of the Massachusetts Legislature to prepare a new schedule of registration fees. It may be added that the conservative reputation of the latter state with respect to motoring laws should have precluded the possibility of suggesting such unfair methods of taxation.

The automobile is rapidly becoming a universal vehicle. There are any number of men of moderate means who are looking forward to the time when they can use a small car and enjoy it with their families. That these people should be encouraged in their ambition to get into the open air and enjoy the pleasures of country opportunity generally will be admitted. The proposition that the automobile does damage to the road out of proportion to its contribution to the public treasury is false. The system of collecting registration fees is fast becoming a means of raising revenue, purely and simply.

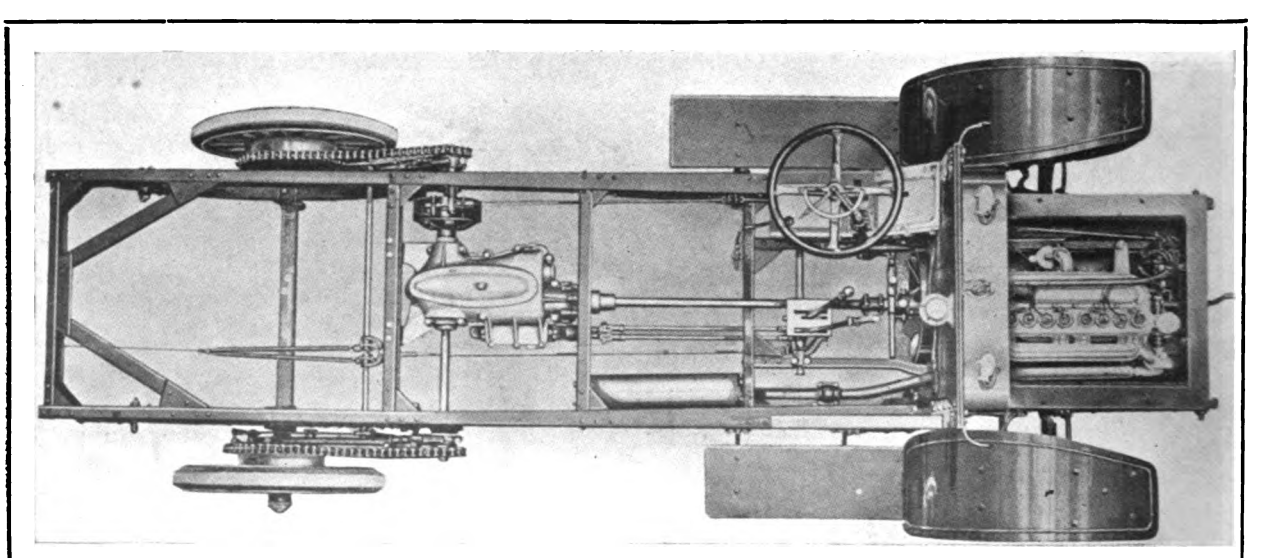
IN THE Commercial Vehicle Field

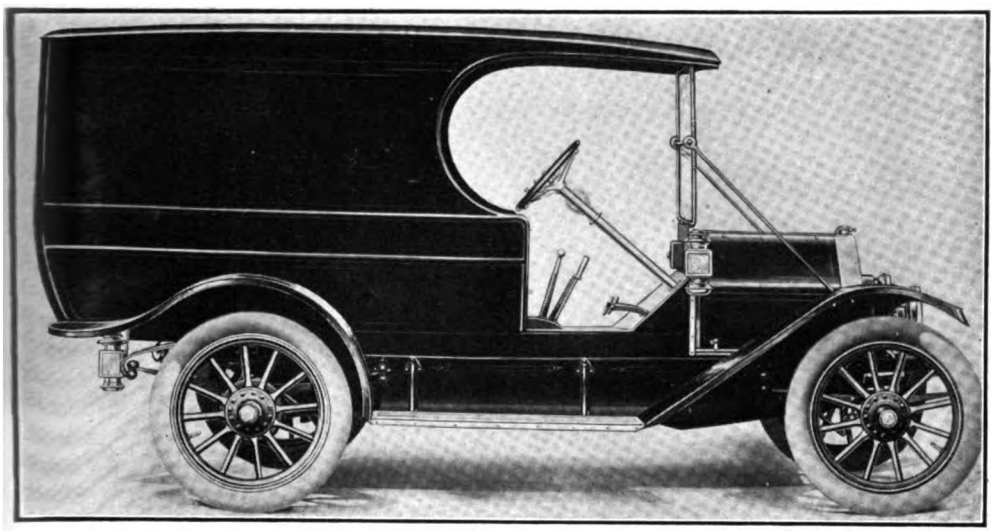
New Trucks and Applications, Time and Money Saved, and Other Items of Interest.



ADAMS ONE-TON TRUCK.

Simplicity, stability, efficiency and appearance are the cardinal points in the construction of the Adams one-ton truck, made by the Adams Bros. Company, Findlay, O. At least, that is the object sought by the designers, and inasmuch as the concern has been engaged in the manufacture of machinery for some 40 years there is abundant reason for believing that it has attained its object in the first three particulars. So far as appearance is concerned, that speaks for itself.

The motor is a four-cylinder, four-cycle, water-cooled unit with a bore of 3.875 inches and stroke of five, giving a rating of 30 horsepower. The cylinders are cast en bloc, with liberal provision for the circulation of cooling water. Pistons are accurately ground and fitted with rings ground on all working sides. The crankshaft is drop forged of 3.5 per cent. nickel steel, large diameter and unusual length of bearing journals, and with three bearings of special composition, insuring excellent service. The camshaft also is drop forged with integral cams, being entirely enclosed in the upper half of the crankcase and actuated by means of spiral gears. All valves are mechanically operated and interchangeable. They are of liberal diameter and located on the right side of the motor.



The crankcase is made of high grade aluminum alloy, and is so designed that the upper half contains all the working components while the lower half constitutes the oil reservoir supplying the lubricant to these parts. The oiling system is so arranged as to offer the combined advantages of the constant level splash and force feed systems. Positive water circulation is effected by a spiral gear driven centrifugal pump, aided by a fan located in the flywheel.

The radiator is of the vertical tube type, provided with two filler caps, permitting filling from either side, a distinct advantage in itself. However, the principal feature in connection with this member is the location, at the rear of the motor in front of the dash. It is held that this not only protects it from danger due to possible collisions, but the mounting is such as to eliminate any damage emanating from the unequal motions to which the side rails of the frame are subjected by reason of traversing rough roads.

Plan View of Adams One-Ton Chassis, Showing Simplicity of Design and Limited Number of Working Parts.

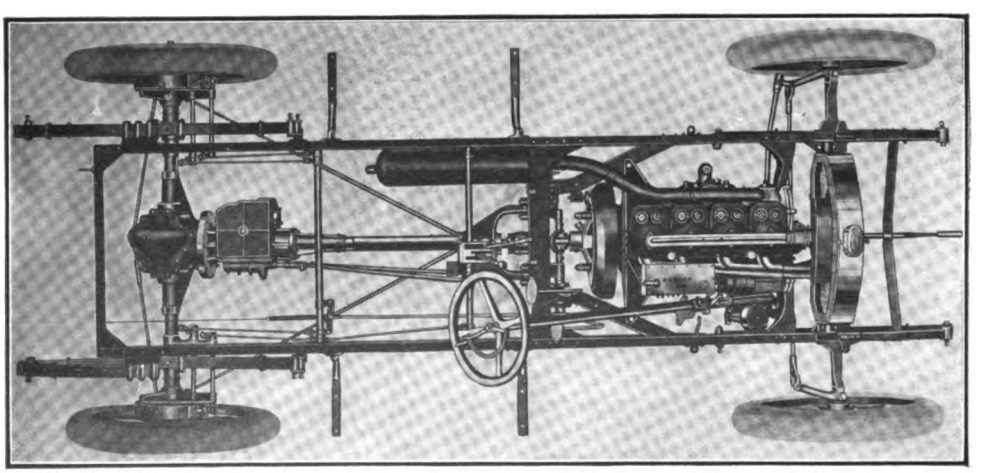
Latest Type of Overland Light Delivery Wagon Known as Model 59 Special.

Ignition is by a dual system, employing an Eiseman high-tension magneto. Steering is accomplished by an irreversible screw and nut Ditwiler type post located on the left, affording left hand drive with its advantages of a clear view of the road in either direction and easy ingress and egress from the seat. The spark and throttle control is mounted on the steering wheel, and with the location of the magneto and carburetor all connections between these are established by two straight rods. The carburetor, which is a Kingston, is also controlled by pedal. The arrangement and location of magneto, water pump, filling funnel and oil gauge on the front end of the engine affords extremely easy access to any part of the motor by simply lifting the hood, and this may be removed without disturbing any other adjoining part.



OVERLAND LIGHT DELIVERY.

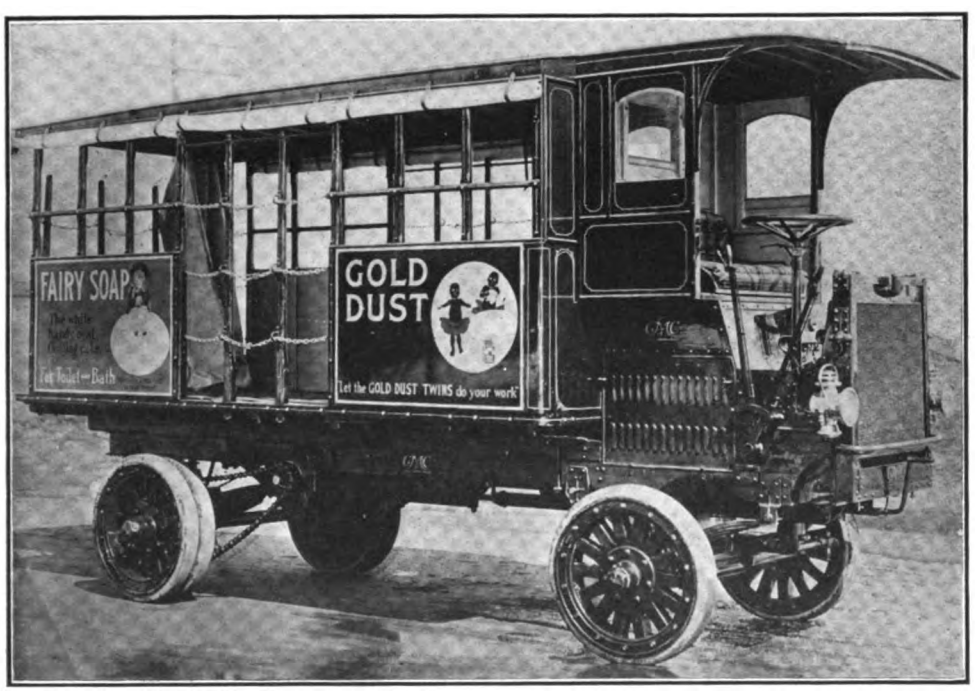
Several new features are brought out in the 1912 model 59 Overland light delivery wagon, made by the Willys-Overland Company, Toledo, O. Only one chassis is provided but this is fitted with two types of body, one of which is shown herewith. This is known as the Special, while the other is the Express, the latter being fitted with open flare board body.

Last year, the motor was rated at 25 horsepower, having a bore of 3.75 inches and stroke of 4.5. This year the motor is rated at 30 horsepower, with bore of four inches and stroke of 4.5. It is of the four-cylinder, four-cycle, water-cooled, L head type, with all valves on the left hand side, where they are operated from a single camshaft with integral cams. The cylinders are cast separately of a high grade gray iron, and are arranged vertically under a hood.

The reputation of the Overland concern in the production of pleasure cars has lost nothing in the careful workmanship and attention to detail which is manifested in the construction of this chassis. All pistons and rings are accurately ground to size. The cylinders are supplied with ample water jacketing surface, and particular attention has been paid to the matter of cooling, which is by the thermo-syphon system. The radiator is of the honeycomb tubular type, supported on either side by trunnions which take up all road stresses. The special design is with reference to securing the minimum amount of wind resistance. The six-bladed adjustable fan is hung from an arm of the crankcase, extended upward, and is driven by belt from the crankshaft.

This latter is of special grade of alloy steel, hardened and ground. The bearings are of liberal area, five in number, plain, die cast, and very accurately fitted. The same extreme care is manifested in the matter of fitting the inlet and exhaust manifolds, to permit easy ingress and egress of all gases. The camshaft is of a selected quality of steel fitted with three bearings of the same material and design as those of

Chassis of Overland Light Delivery Wagon Presents Neat and Attractive Appearance.



Digitized by Google

the crankshaft. The camshaft is hardened and ground to limits, thus insuring the size of the bearings and the certainty of valve timing.

Lubrication is by force feed oiler to the cylinders with constant level splash in the crankcase. Ignition is by jump spark, utilizing Splitdorf dual magneto and dry cells. The carburetor is of the float feed type and ignition and carburetor are controlled by levers located on the steering post.

The clutch is a cone member with a woven asbestos and wire facing, which is heat proof and will not char. The transmission last year was planetary. This year it is selective, affording three speeds forward and reverse. Drive is by shaft, through the torsion tube to the bevel gear on the live rear axle, which is of the semi-floating type and equipped throughout with Hyatt roller bearings. The frame is channel section cold rolled steel. The front springs are semi-elliptic and the rear three-quarter elliptic. The front axle is an I beam forging. Service brakes are expanding on the rear wheel hubs controlled by pedal, the emergency members, contracting on the rear wheels and operated by lever. The wheelbase this year is 106, as compared with 102 in 1911. The tread is 56 inches. Wheels are of the artillery wood type, with 33 by four-inch tires all around.

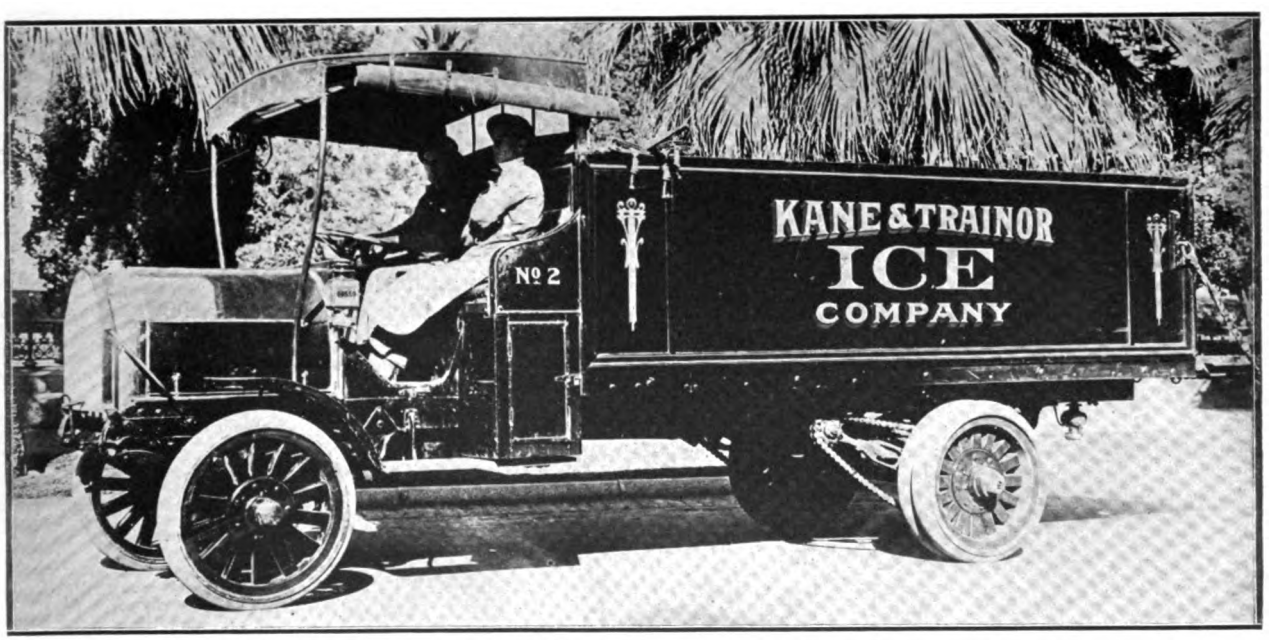
It will be noted from the accompanying illustrations that the control is in the centre, although right hand location of driver is provided. Every effort has been made to present a satisfactory delivery wagon from every viewpoint. To this end the body dimensions are very liberal. That illustrated has a length of 60 inches and width of 43, while the Express is 67 by 42. The height of the interior in the enclosed car is 53 inches.

G. M. C. 3.5-Ton Truck Owned and Operated by N. K. Fairbanks & Co., Chicago.

G. M. C. FOR GOLD DUST TWINS.

N. K. Fairbanks & Co., Chicago, Ill., maker of the famous Gold Dust washing powder, with which housekeepers throughout the land are more or less familiar, has adopted the motor vehicle in solving its transportation problem in its home city. As will be seen by the illustration herewith, it utilizes a 3.5-ton G. M. C. gasoline truck, made by the General Motors Truck Company, Detroit, and it may be added that side panels have been arranged so as to afford ample opportunity for still further advertising the product of the company. The vehicle is propelled by a four-cylinder, four-cycle, water-cooled motor, having a bore and stroke of five inches, and rated at 40 horsepower. The location is under the seat with driver and levers at the right. Cooling is by cellular radiator, and ignition is double, with two sets of plugs, current being furnished by a Mea magneto and storage battery. A ball type speed governor is fitted to prevent the operator from exceeding the rated speed of the vehicle. The clutch is of the disc type, the transmission progressive, affording three speeds forward and reverse, and final drive is by side chains. Two sets of brakes are employed, these being of expanding and contracting types on the rear wheels, which are equipped with 36 by four-inch dual solid tires. The front members are 36 by five-inch single solid. The front springs are semi-elliptic and the rear full platform. It will be noted that the body is of the stake platform type with top and side curtains, and that the driver is fully protected from the weather by a cab.

NEW ELECTRIC LINE.



The Atlantic Vehicle Company has been organized in North Newark, N. J., for the purpose of producing a line of electric trucks, which will be known as the Atlantic. Four models will be constructed, of one, two, 3.5 and five tons capacity, respectively. The designer is Arthur J. Slade, who has been connected

Digitized by Google

with the production of electric vehicles for a number of years, in co-operation with others who are extremely well versed with the demands of the mechanical transport problem. The officers of the company are: President, McKinley Boyle; vice president and sales manager, Ralph Sanger; chief engineer, Arthur J. Slade.

KISELKAR FOR ICE TRANSPORTATION.

An accompanying illustration shows one of the KisselKar trucks, made by the Kissel Motor Car Company, Hartford, Wis., in service with the Kane & Trainor Ice Company at Stockton, Cal. It will be noted that special attention has been paid to the body design, which not only presents a decidedly attractive appearance but is extremely well executed for the work in hand, particularly in the climate in which the vehicle operates.

KisselKar Truck in Service with the Kane & Trainor Ice Company at Stockton, Cal.

The motor is a four-cylinder, four-cycle, water-cooled unit, placed forward under a hood, with driver and levers at the right. The clutch is a large cone member of the adjustable type, and power is transmitted through a selective sliding gear, affording four speeds forward and reverse. Final drive is by side chains of ample dimensions.

A feature of the rear system is a differential locking device by means of which it is possible to lock the driving axles as one member, thereby facilitating traction when one rear wheel is in mud or on slippery ground. It also provides an emergency drive in the event of the chain breaking, as the car could be propelled by the remaining member. The Kane & Trainor Ice Company is very much pleased with the vehicle, since it has demonstrated its value, economy and power in the successful transportation of ice under severe conditions.

LAMBERT TRACTORS ANNOUNCED.

The Buckeye Manufacturing Company, Anderson, Ind., well known in the industry as maker of the Lambert pleasure and commercial lines, employing the patented Lambert friction drive, has decided to locate a factory in Los Angeles, Cal., for the production of the Lambert friction driven orchard and farm tractor, on which it has been working for some little time. It is understood that this plant will be operated as an entirely separate institution, and that no trucks or pleasure cars will be constructed, at least for the present.

The new tractor is a three-wheeled vehicle, with the single wheel in front. The entire assembly is with an extremely low centre of gravity, the total height being 42 inches. The driver is located at the rear on a skeleton type of seat, with the steering wheel immediately in front. This is of the usual automobile construction, except that the column extends to the bottom of the centre of the vehicle, thence by the ordinary arrangement to the front wheel.

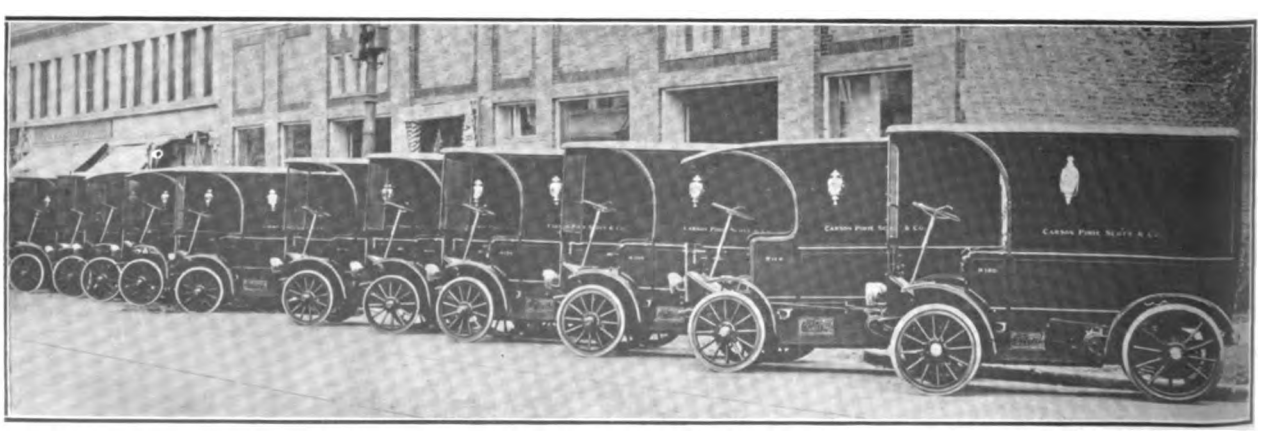
The motor is over the rear wheels and the friction transmission in front. It will thus be seen that the method of drive is exactly the reverse of that in the present construction of Lambert cars and trucks, in that the motor first drives forward to the discs, thence backward to the rear wheels. These latter are shod with rubber, but in addition metal cleats are fitted for auxiliary tractive effort when the machine sinks into soft ground. The front wheel rim is a broad band of steel with rubber in the centre, so designed

Digitized by Google

Stegeman Fire Insurance Patrol Wagon in Service with Underwriters in Milwaukee, Wis.

that only the rubber comes into play when traversing hard road surfaces.

STEGEMAN FIRE PATROL.



While the Stegeman Motor Car Company, Milwaukee, Wis., is best known through its production of the Stegeman truck, it is of interest to note that it has joined the ranks of fire apparatus manufacturers in that it has produced an exceptionally successful insurance patrol wagon which has been in service for some months with the Board of Fire Underwriters in its home city. It is stationed in house 2, at Ninth and Calena streets, and covers the outlying sections of the north,east and west sides, in which work it has had abundant opportunity to demonstrate its practical worth.

The motor is of the four-cylinder vertical type, giving 50 horsepower by dynamometer test with direct drive on the high speed, or when travelling from 35 to 40 miles an hour. The drive is by jackshaft to the rear wheels, through enclosed chains running in a bath of lubricant. All operating parts are enclosed and run in oil or grease. Oil holes have been eliminated and lubrication throughout is furnished by large and positive grease cups.

The frame is of pressed steel, reinforced with five cross sections and strengthened by thrust rods between spring centres. All mounting of the wheels is on ball bearings with a special thrust bearing to take up excessive side strains in making the necessary turns, so frequent with fire apparatus. Springs are semi-elliptic, front and rear, and supplementary coil springs and shock absorbers take up all injurious rebound. The body is constructed of welded steel, eliminating all rivets. Lockers are built on both sides with a through centre aisle.

ELECTRIC DELIVERY WAGONS.

An accompanying illustration shows a part of the fleet of 22 1000-pound Detroit electric delivery wagons, made by the Anderson Electric Car Company, Detroit, and in service with Carson Pirie Scott & Co., Chicago. These vehicles have been in operation for more than a year and have given entire satisfaction in covering various routes. These shown are garaged in South Chicago and operate in that territory, while others are stationed in Evanston and Highland Park. A few of the machines owned by the company are of one ton

Part of the Fleet of Detroit Electric Delivery Wagons Utilized by Carson Pirie Scott & Co., Chicago.

Digitized by Google

capacity and are utilized in delivering goods to substations, from which these lighter cars operate.

The 1500-pound wagons are equipped with Edison 60-cell batteries, although it may be stated that all vehicles made by the Anderson company use the Edison battery exclusively. The motor is of the firm's own make, a series wound type, in which varied road and load conditions are handled without undue increased current consumption. The controller is of the continuous torque, drum type, also made by the Anderson concern.

Two sets of brakes are employed, these being expanding on wheels and countershaft. Springs are semi-elliptic, front and rear, resting on large axle seats, through which suitable holes are drilled for the clips. The frame is of channel, angle and T steel. All joints are hot riveted. Sheet steel is employed for the battery and motor compartments, this being riveted to the frame members and battery supports. The front axles are I beam and the rear rectangular, both being special drop forgings. All wheels are of the artillery type, made from selected second growth hickory. The wheelbase is 80 inches and the tread 56. Tires are solid, 32 by 2.5 inches in front and 34 by three inches rear. The rated speed is 14 miles an hour and the mileage, loaded, about 50.

NEW CONTINENTAL WAGON.

E. M. Anderson and Dr. J. G. Barnstable of Superior, Wis., have incorporated the Continental Motor Truck Company for the purpose of producing a new wagon of one to three tons capacity to be known as the Continental. Only one chassis will be made at present, to which three standard types of body will be fitted, one an open express, one with closed panels and the third a stake platform.

The motor will be a four-cylinder, water-cooled unit, with bore of 4.125 inches and stroke of 5.25. Ignition will be by high-tension magneto mounted on the side of the crankcase and in a most accessible position. Water will be circulated by the gear driven pump through a radiator which forms a part of the dash, out of the way of both accident and injury. An automatic governor will be fitted to regulate speed.

The clutch will be a cone member, from which the drive will be through a four speed transmission to the jackshaft which will carry the differential and sprockets, final drive being by chain. The frame will be of steel, double trussed and mounted on semi-elliptic springs in front and full platform members in the rear. Brakes will be of the internal expanding and external contracting types. Tires will be 36 by 3.5 inches in front and 40 by four in the rear, solid rubber. The wheelbase will be 120 inches and the tread 56.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

NEW YORK LICENSE FEES.

Secretary of State Lazansky of New York has issued a statement showing that since Feb. 1 the revenue from automobile licenses has totaled $609,073.50. This amount was paid by 58,732 owners and 30,470 chauffeurs. The greater part of this money was taken in by the New York office, with Buffalo and Albany next in order of receipts.

SUCCESSFUL COLE DISTRIBUTOR.

One of the most genial and popular of the New York motor men is Sydney H. Veal, the secretary of the Colt-Stratton Company, eastern distributor for the Cole car, made by the Cole Motor Car Company of Indianapolis, Ind. This concern has one of the finest automobile establishments in New York City, at Broadway and 68th street, and has been unusually successful, which Mr. Veal's many friends assert is due in great part to his activities. The company has over 50 agents in its territory, handling a large number of cars annually.

Sydney H. Veal, Secretary Colt-Stratton Company.

Mr. Veal has had considerable experience in the automobile industry, having served in responsible positions with a number of prominent concerns. During 1905 and 1906 he was chief accountant for the Cleveland Motor Car Company in Cleveland, O., and in 1907 he was appointed secretary of the company. In the fall of that year he was sent to New York as the manager of the branch there, where he was associated with William M. Turner, who was his sales manager and who is now manager of the Amplex agency in Boston. In the spring of 1909 the Cleveland company went out of business, and the following fall Mr. Veal, with William L. Colt and Harry L. Stratton, formed the present organization of the Colt-Stratton Company to handle the Cole car in the eastern section of the country. The combined activity of these three men has done much to bring about success for the maker in Indianapolis, and their advice has been sought frequently in the matters of design and construction.

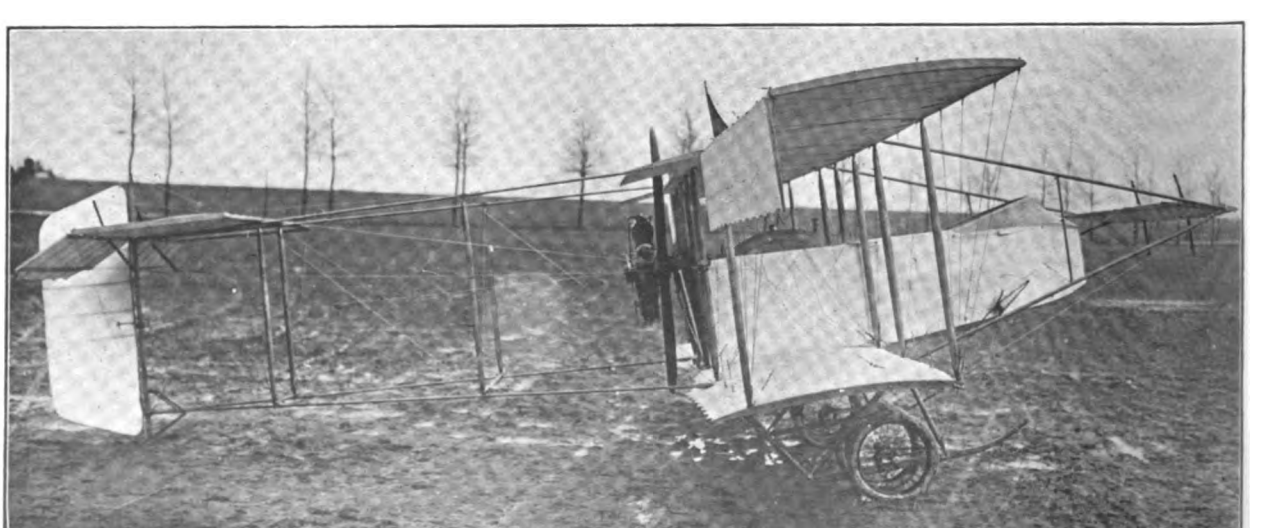
The cup defense committee of the Aero Club of America has invited proposals for the construction of an American aeroplane with which to defend the Gordon-Bennett cup in the fourth international race at Chicago, Sept. 9. These proposals will be received by the committee at its office, 297 Madison avenue, New York City, until June 1, and each must be accompanied by a certified check for $1000. The committee requires the following test:

"Each aeroplane shall be tested over a course which shall be a closed polygon whose perimeter, 3.106 miles (five kilometers) in extent, shall enclose an area 25 times the perimeter and contain no acute angle. The aeroplane shall make 124.27 miles (200 kilometers) over this course in one continuous flight in the same direction in a time to exceed 1:14:33.4.



"The place for the trials shall be determined by the committee, and the aeroplane shall be delivered thereat ready in all particulars for the trial on or before Aug. 1, 1912, and each machine shall be accompanied by an American pilot who shall drive the same during the trial and who shall have agreed to drive in the international race if nominated for same. After having landed at the completion of the trial each aeroplane, with all its parts and accessories, shall be in a suitable condition to repeat this performance 24 hours thereafter without replacing any except unimportant minor parts.

"During the trial each machine shall be flown at the risk and expense of the manufacturer, and the defense committee shall be free of all liability of any nature whatsoever that may have arisen previous to the acceptance of the machine."

The winning machine will be purchased by the committee for $10,000 and will represent America in the race. Other specifications provide that the power plant, as well as minor details of the machine and accessories, may be of foreign design and construction.

The latest type of Henri Farman military biplane offers some slight differences in detail, chief among which may be mentioned the larger hinged ailerons on the upper main plane, the enclosure of the engine housing and in the use of but one tail plane. Some of these innovations, if such they may be termed, have appeared in a modified form in previous construction, and as a whole, the machine cannot be said to offer any radical departure from accepted Henri Farman design.

One of the accompanying illustrations shows the

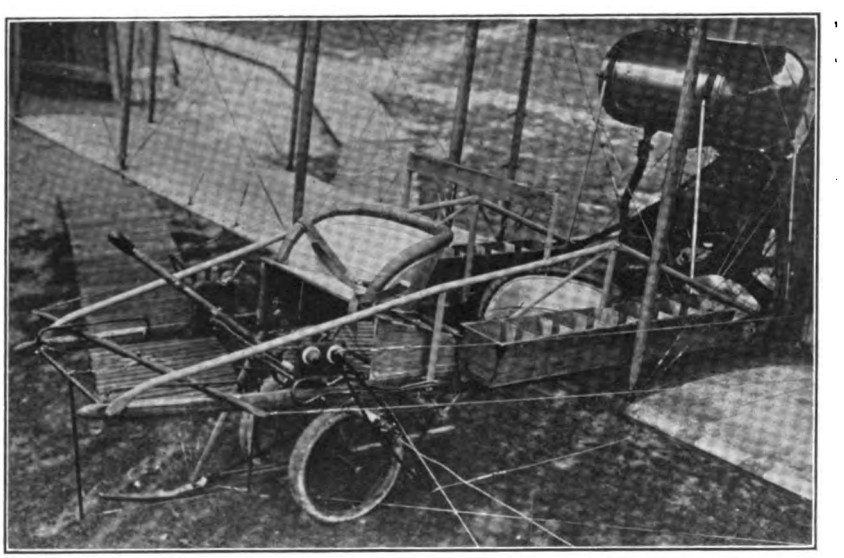
Latest Type of Henri Farman Military Biplane, Which Presents Some Slight Departures from the Standard Design Heretofore Employed.

Digitized by Google

construction of the pilot's cockpit, in which it will be seen that provision is made for the passenger at the rear of the operator and somewhat lower down. Disposed on either side of him are compartments in which are carried eight bombs. Provision also is made for discharging these projectiles through the bottom of the machine between the passenger's feet. This device is so arranged as to be governed with relation to the speed of the biplane, in an attempt to drop the missiles upon a given spot. The other details are apparent from a careful study of the photograph.

The first annual German aviation exhibition in Berlin last month was of special interest because of its indication of the present attitude of Germans toward the aeroplane. As is more or less well known, this country was particularly absorbed in the dirigible balloon, while others were engaged in exploiting the heavier-than-air machine. However, among the exhibits was the original Wright biplane, with which Orville Wright made flight at the Templehof field early in September, 1909. This machine, now the property of the German museum at Munich, stood beside the latest Wright biplane constructed for the German army.

The comparison was somewhat striking, and was an interesting commentary upon the advancement in the science during the past 2.5 years. The first machine had two light propellers and its equipment comprised only the indispensable things. Of course, it was not supplied with a tail. The latest military machine made under license in Germany has but one propeller, which is a distinct departure from the Wrights constructed in this country and elsewhere abroad, and a tail. Its equipment includes all the accessories now considered so necessary, including a wireless telegraphy outfit.



Other notable exhibits were the Euler biplane in which Prince Henry of Prussia secured his pilot's license. Beside it was the latest Euler military biplane, termed an aeroplane destroyer, on which was mounted a rapid firing machine gun; that is, there was a gun on it once; although as exhibited the mounting only was shown because the German government is not yet ready to disclose the details of the gun itself.

One monoplane was shown with three propellers, and another was equipped with two propellers, each working separately from an individual motor. Still another exhibit was a Sigismund, displayed by Prince Frederick Sigismund of Prussia, many times a millionaire. He proudly declared the machine was built entirely by himself without the assistance of engineer or mechanic.

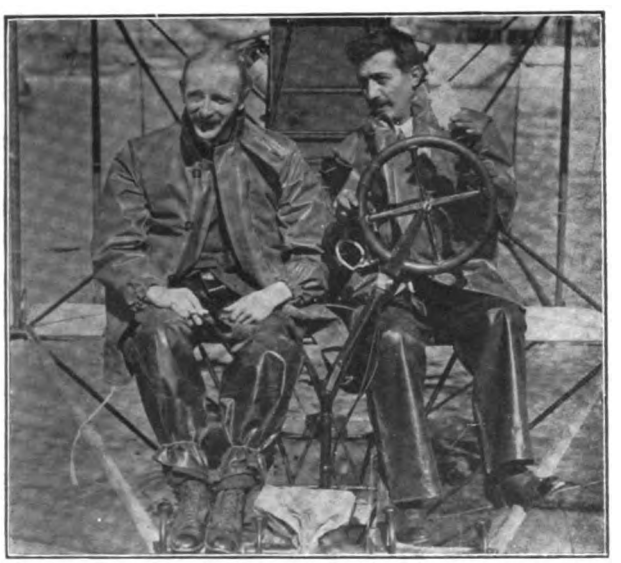
Of particular interest in this connection is the matter of ignition. Sixty-eight of the motors and completed machines were equipped with magnetos, and of these 53 employed the Bosch, seven the Eisemann, five the U. & H., two the Mea and one the Pintsch.

Corbet Wilson flew across the Irish channel from Fishguard, Wales, to Enniscorthy, Ireland, April 22, being the first aviator to make a continuous flight between the two countries. The distance flown was approximately 60 miles.

Harry N. Atwood, who made a new mark in American aviation May 1, by flying from Saugus, Mass., to Wells, Me., the first man to fly into the State of Maine from another state, is laying his plans to start on his proposed trans-Atlantic flight June 29. In a recent letter to Secretary George von L. Meyer of the United States Navy, Atwood requested that a torpedo boat

Cockpit of New Henri Farman Military Biplane, Showing Provision for Carrying and Dropping Bombs.

destroyer be assigned to accompany him on his trip.



Secretary Meyer points out in his reply that in his opinion the detailing of a boat of this character probably would be impractical, in view of the fact that notwithstanding its great speed it hardly would be a match for an aeroplane. Atwood desires that the American government detail a boat to be stationed about 500 miles off the New England course, to the deck of which he might fly in case it proved necessary. Secretary Meyer wishes further information upon the subject before granting the request, and suggests that it will be granted only on the condition that the government shall not be held responsible in any way for the success of the undertaking. He concludes:

"This department is desirous of encouraging efforts to popularize the sport of marine flying, and to afford a dignified means of imparting useful information concerning the art of aviation, its scientific possi-

Digitized by Google

bilities and its future usefulness; but I wish to make clear to you in the case of your proposed trans-Atlantic trip that the department, even if able to co-operate with you in any way, could not assume the slightest responsibility for the venture or give any assurance of the extent to which you might rely upon any naval vessel for assistance."

Louis Paulhan, who recently secured the European agency for the Curtiss hydraeroplane, has established what he calls an aquaplane school at Juan-le-Pias. An accompanying illustration shows Paulhan and a passenger about to take flight in one of the Curtiss machines. Inasmuch as this is the first picture of the pioneer aviator in an American made machine, as well as the first view of him seated in any machine for several months, it will prove of interest to his many friends in this country. Perhaps it need not be stated

Louis Paulhan and Passenger About to Make Flight in Curtiss Hydraeroplane.

that Paulhan is at the wheel, holding a small card in his hand, while the passenger is at his right.

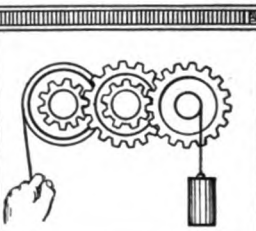
Flying a Wright biplane at the Nassau Boulevard field on Long Island, April 27, George Beatty carried five passengers twice around the course, creating a new American record for passenger carrying. The world's record is held by Roger Sommer in a Sommer biplane with 12 passengers, a total load of 1532 pounds. Beatty's load weighed 845 pounds.

The Loening aeroboat, designed by Grover C. Loening and constructed by the Queen Aeroplane Company of New York City, was given its first official tests at Bayonne, N. J., April 27. The machine is sustained on the water by a hull about 25 feet long, resembling that of a motor boat. In this the pilot sits well forward, a windshield and the control mechanism alone being in front of him. Behind is the 50 horsepower Gnome, and above a single pair of planes with a wing area like a small Berliot monoplane, spreading 28 feet. The light boat takes the place of a monoplane body, and at its stern is a special type of rudder. The total weight of the machine is 700 pounds. Its first trial demonstrated that it is a practical craft, arising from and alighting on the water with ease.

Following the recent hydraeroplane meet at Monte Carlo, Monaco, the British Admiralty has purchased a Henri Farman machine fitted with hydraeroplane attachment, similar to that flown by Fischer in winning first place at the meet. Inasmuch as several other European governments have been purchasing Curtiss machines, which are designed and constructed throughout as hydraeroplanes, it is significant that the British government should have decided upon an ordinary biplane fitted with floats.

It is understood that the Aero Club of Ilinois, which will have direct supervision of the international meet, at which the fourth international race will be flown, already has been guaranteed of the receipt of $100,000 pledged by interested citizens. The administration of the meet will be in charge of the following: General manager, James S. Stephens; secretary, Harold W. Robbins; controller, John B. Cunningham; consulting engineer, Sidney V. James.

The grand circuit race, starting and ending in Chicago will begin Sept. 15. The following stopping places, or controls, have been selected: Des Moines, Ia.; Omaha and Lincoln, Neb.; Kansas City and St. Louis, Mo.; Indianapolis, Ind.; Cincinnati, Dayton and Cleveland, O., and Detroit, Mich. These cities will share in the expense of the race.



The Aero Club of New England has decided definitely to hold an aviation meet at the Atlantic flying field, Squantum, Mass., June 29-July 7. This is the same site on which two successful meets of the Harvard Aeronautical Society have been held, although neither of them proved satisfactory from a financial viewpoint. William A. P. Willard has been engaged as manager of the third venture, and it is stated that eight aviators already have signified their intention of making entry.

Capt. Thomas S. Baldwin, who with Lee Hammond has been spending five months in the Orient, flying in 20 cities in Japan and China, has returned to America.

It transpires that among the survivors of the ill fated Titanic was Pierre Marechal, who was on his way from France to Hammondsport, N. Y., for the purpose of securing a contract with Glenn H. Curtiss to represent the Curtiss hydraeroplane in Switzerland. Marechal returned to France last week and will give exhibition flights over Lake Geneva this summer.

Digitized by Google

RECENT MOTOR VEHICLE PATENTS

Scheller Valve Grinding Tool.

The valve grinding tool which may be rigidly attached to the motor during the work, and which is adjustable to any type of engine, has been patented by John Scheller, Milwaukee, Wis. It comprises a post member which is screwed into the opening of the cylinder utilized for the spark plug, and locked by a nut. The top of the post carries a horizontal arm on which is fitted a slidable extension and provision is made for locking the parts securely. The adjustable extension is hinged, and is equipped with a vertical member which serves as a guide for the vertical rod carrying the valve turning bit. The upper part of the rod is fitted with horizontal extensions which carry handles for the purpose of rotating the tool in either direction. During the process of grinding in the valve, the latter may be lifted from its seat by means of the hinged member.

Stevens Battery Holder.

The utilization of dry cells in the motor car requires caution in installing else the efficiency of the members is apt to be impaired through short circuits. The usual practise is to employ waste or paper to secure the batteries and to prevent the terminals from coming in contact with one another. Herbert A. Stevens, Malden, Mass., has been granted a patent for a battery holder which permits the installation or removal of the cells as a unit and it is claimed that the device will hold the members securely. It comprises a series of belts or band members attached to a vertical support and the lower band is equipped with cross sections which serve as retainers for the cells. These bands conform to the shape of the batteries and when the latter are in position it is stated that they will not jar out of their relative positions.

Shlosberg Muffler.

Maris Shlosberg, Chicago, has patented a muffler which varies from those of usual construction in that it is cone shaped. It consists of a pair of hollow cones secured together at their bases and separated by a divisional plate having slight communicating openings between the cones located near its periphery. One of the cones is connected to the exhaust pipe while the other is equipped with a tube having an opening considerably smaller in diameter than that of the pipe. The exhaust gases from the motor enter the first cone, encounter the divisional plate, and are deflected through the openings into the second chamber, thence out into the open air. The inventor claims that back pressure is eliminated and that the noise of the explosions is reduced to a minimum.

Gilbert Automatic Funnel.

A patent has been granted Fred E. Gilbert, Jacksonville, Fla., for an automatic funnel having a valve mechanism whereby the flow of liquid either up or down may be controlled as desired by the operator. It is similar to the ordinary funnel except the upper portion is bowl shaped and the tube carries three valves having seats. The lower valve is fitted with a float, its function being to close the tube preventing an overflow of the funnel. Another valve controls the ports through which the liquid flows while the third member is provided with locking mechanism, preventing the movement of liquid in either direction.

Hoffman Number Plate.

One of the objections to attaching number plates to the front of the radiator is that the efficiency of the cooler is reduced thereby, also that the supporting members are likely to chafe the thin metal of the fins causing leaks. Peter M. Hoffman, Chicago, has been granted a patent for a number plate designed for attachment to the radiator, which he claims overcomes these difficulties. The plate is perforated, said openings corresponding to those of the cooler, and the extensions of the plate are provided with means for holding the member securely and thus eliminate chafing.

Sinclair Safety Crank.

The introduction of the self-starter for internal combustion engines has stimulated the efforts of inventors along the lines of safety devices for attachment to the starting crank so that in the event of a backfire the operator will not be injured. George B. Sinclair, Medford, Mass., has been granted a patent for a device which, it is claimed, will automatically release the clutching member of the starting crank when the latter is rotated other than in the normal direction of the motor. The extension of the crankshaft of the motor carries an integral clutch member which engages with a similar part slidably mounted, and attached to this is the starting handle. The moving member has a shoulder which engages with a bell crank pivotally mounted, and is actuated by a pawl in engagement with a ratchet wheel integral with the sliding clutch. A spring holds the pawl in contact, the latter permitting the ratchet to rotate in one di-

Digitized by Google

rection but if the latter be reversed as by a backfire, the pawl member imparts motion to the bell crank, which being in contact with the shoulder in the sliding clutch automatically disengages the latter.

Mallins Self-Starter.

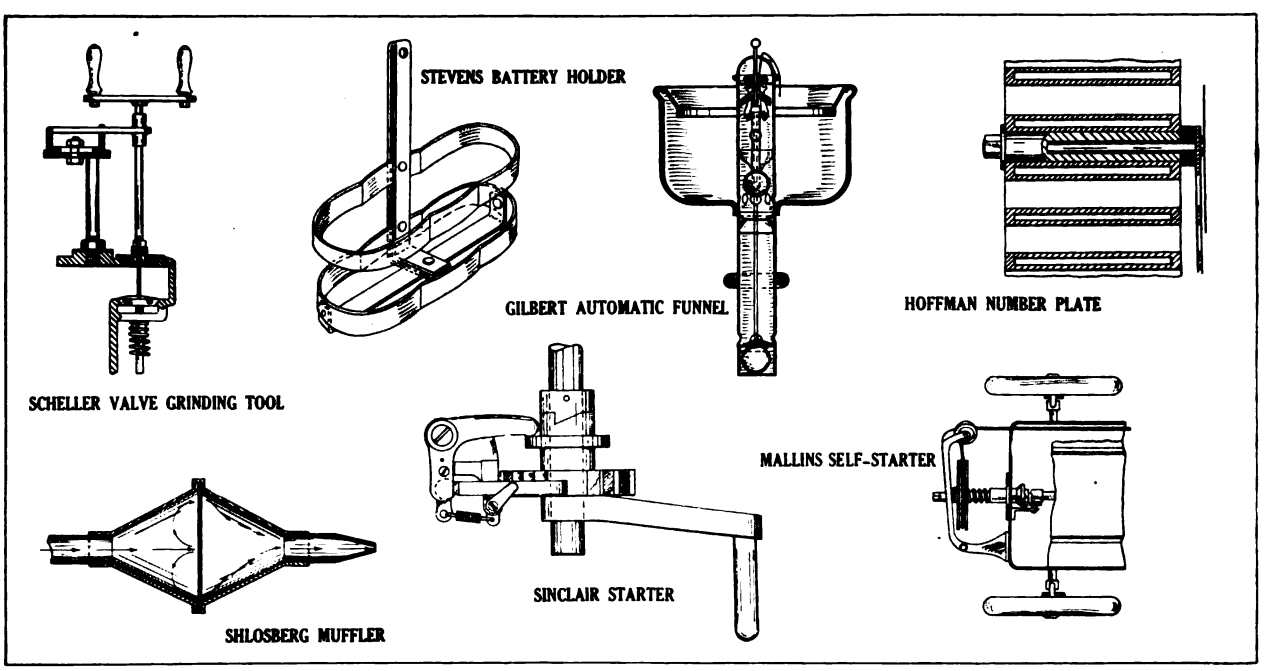
Although the self-starter is not taken as seriously in England as in this country it is interesting to note that an American patent has been granted Charles William Mallins of Liverpool, England, for a device for starting internal combustion motors from the seat of the car. It is unique in its construction, inasmuch as it is operated by pulleys and a cable. The latter, which is equipped with a shovel shaped handle on the dash, extends therefrom to the front of the motor passing over a pulley fitted to a pivotally mounted arm. The latter carries a larger pulley on which the operating cable is coiled, and is attached to an axially movable shaft provided with a coupling for engagement with the end of the crankshaft of the motor. The large pulley is equipped with a spring, the function of which is to coil up the cable, after the latter is unwound by operation. Means are provided for disengaging the clutch coupling from that of the engine shaft if the rotation of the latter be reversed. In practise the handle is grasped by the operator and when pulled brings the movable arm and clutch into engagement with the crankshaft. A further movement of the cable rotates the larger pulley which in turn imparts motion to the crankshaft of the engine. Upon releasing the handle the spring rewinds the cable. It is claimed by the inventor that the device is operated easily and that it may be attached without any great alteration to the car.

OTHER PATENTS GONE TO ISSUE.

Tank Bracket and Step, Russell Huff, Detroit. A combination of step and bracket for holding an acetylene gas tank.

Spring, William R. Park, Taunton, Mass. A vehicle spring composed of resilient leaves in sliding contact with each other and having a film of wax between adjacent leaves.

Windshield, Chicago Coach & Carriage Company, Chicago, Ill. A windshield in which both upper and lower parts may be moved into various positions, each part independently of the other.



Solid Tire, Alexander Dow, New York City. A solid rubber tire containing several separated layers of fabric, each layer being formed into undulations whose crests extend diagonally of the tire, and with the weave of the fabric extending diagonally of the piece.

Self-Starter, Louis T. Weiss, Jr., New York City. A starter using acetylene gas under pressure, a handle on the dash operating tank valve and individual cylinder valves.

Motor, James C. Peache, Rugby, England. A two-cycle engine with a single sleeve bearing the inlet and exhaust ports at opposite ends.

Clutch and Starter, E. U. G. Reagan, San Antonio, Tex. A combination of clutch and starter, in which a spring is used to turn over the motor, being wound by the latter when running.

Tire, A. William Torkington, Purley, England. A solid tire in two circular halves, held by a band bearing cross arms bolted to plates at the side of the tire.

Some Recent Patents of Interest to the Manufacturer, Agent and Owner, Including Safety Starting Crank, Valve Grinding Tool, Self-Starter, Dry Cell Holder, Number Plate Holder, Automatic Funnel, Etc.

Digitized by Google

Lamp, William K. Lenhart, Philadelphia. An acetylene lamp containing one central fixed burner and two adjustable burners, one on each side of the central burner.

Spark Plug, William Ellis, Harrod, O. Has a number of electrodes in two sets with two terminals.

License Tag Holder, John W. Yochem, Tiffin, O. Plate is held top and bottom in channels, the lower part of the device being adjustable to take different size plates.

Motor Fire Apparatus, Harry W. Eisenbise, Reading, Penn. Combination chemical and water pump, the chemical tank valves being three-way allowing chemical to be directed to chemical hose line or mixed with water in the water hose.

Pneumatic Wheel, W. W. Guest, Alameda, Cal. The tread of this is in sections, each section being connected to a piston working in a cylinder containing air. Each cylinder is connected to a compression chamber except when the piston moves inward under the weight of the vehicle.

Lamp, R. G. Harris, Knoxville, Tenn. A lamp containing three reflecting partitions whereby rays of light from one source are directed through bull's-eyes to the right, left and below.

Muffler, Joseph Hall, Manchester, England. The first baffle plate has a dome shaped head which deflects the gases to perforations in the flat portion. The course of the gases is changed three times before they exit.

Electric Horn, Adam Lungen, assignor to Edwards & Co., New York City. A diaphragm is struck by a spring vibrated by an electro magnet, similar to the manner of the vibrator of a coil.

Tire, S. T. Allen, assignor to Triplex Tire Company, Detroit, Mich. The felloe is surrounded by a resilient band around which are arranged interlocking T shaped members, reinforced by metal pieces and held by a flange.

Electric Lighting and Starting System, Charles E. Bonine, Philadelphia. Consists of a shunt and series wound motor-generator, and storage battery with aumatic switch.

Rotary Engine, Jules F. Bourlon, Everett, Mass. Cylinder is annular with a continuous slot in its inner periphery. The pistons are provided with flanges overlying the slot and explosion chambers are formed by movable abutments.

Anti-Skidding Device, Edmund Kron, Milwaukee, Wis. Consists of a runner attached to wheel hub and adjusted a short distance above road surface, becoming effective in snow or mud when wheel sinks in same.

Lamp Bracket, Thomas C. Luce, assignor to the Luce Manufacturing Company, Dalton, Mass. This may be clamped to the frame of the vehicle, and the arms are separate and adjustable to different sized lamps.

Automobile Clock, Henry W. Matalene, New York City. A clock which may be either wound or set by rotating a ring located on the outside of the case.

Carburetor Attachment, H. E. Rogers, New London, Conn. A tube feeding a mixture of oxygen and air to the carburetor.

Carburetor, R. S. Hill and O. P. Underwood, Indianola, Ia. A carburetor in which the air supply is regulated by means of two plates, one covering openings in the other, the separation of the plates determining the volume of air which passes.

Differential, Otto Zachow, assignor to Four Wheel Drive Auto Company, Clintonville, Wis. Sleeves over the axle are connected to the driving member of the differential and may be engaged with the axle forming a differential lock.

Spark Plug, Franz Bartl, New York City. The outer shell of this has an annular shoulder on the interior, against which the core is tightened, and the electrode is circular.

Pipe Wrench, H. R. Sinclair and Carl Ekman, Worcester, Mass. The gripping member of this is a strap held in a wedge shaped passage on the handle by means of a wedge.

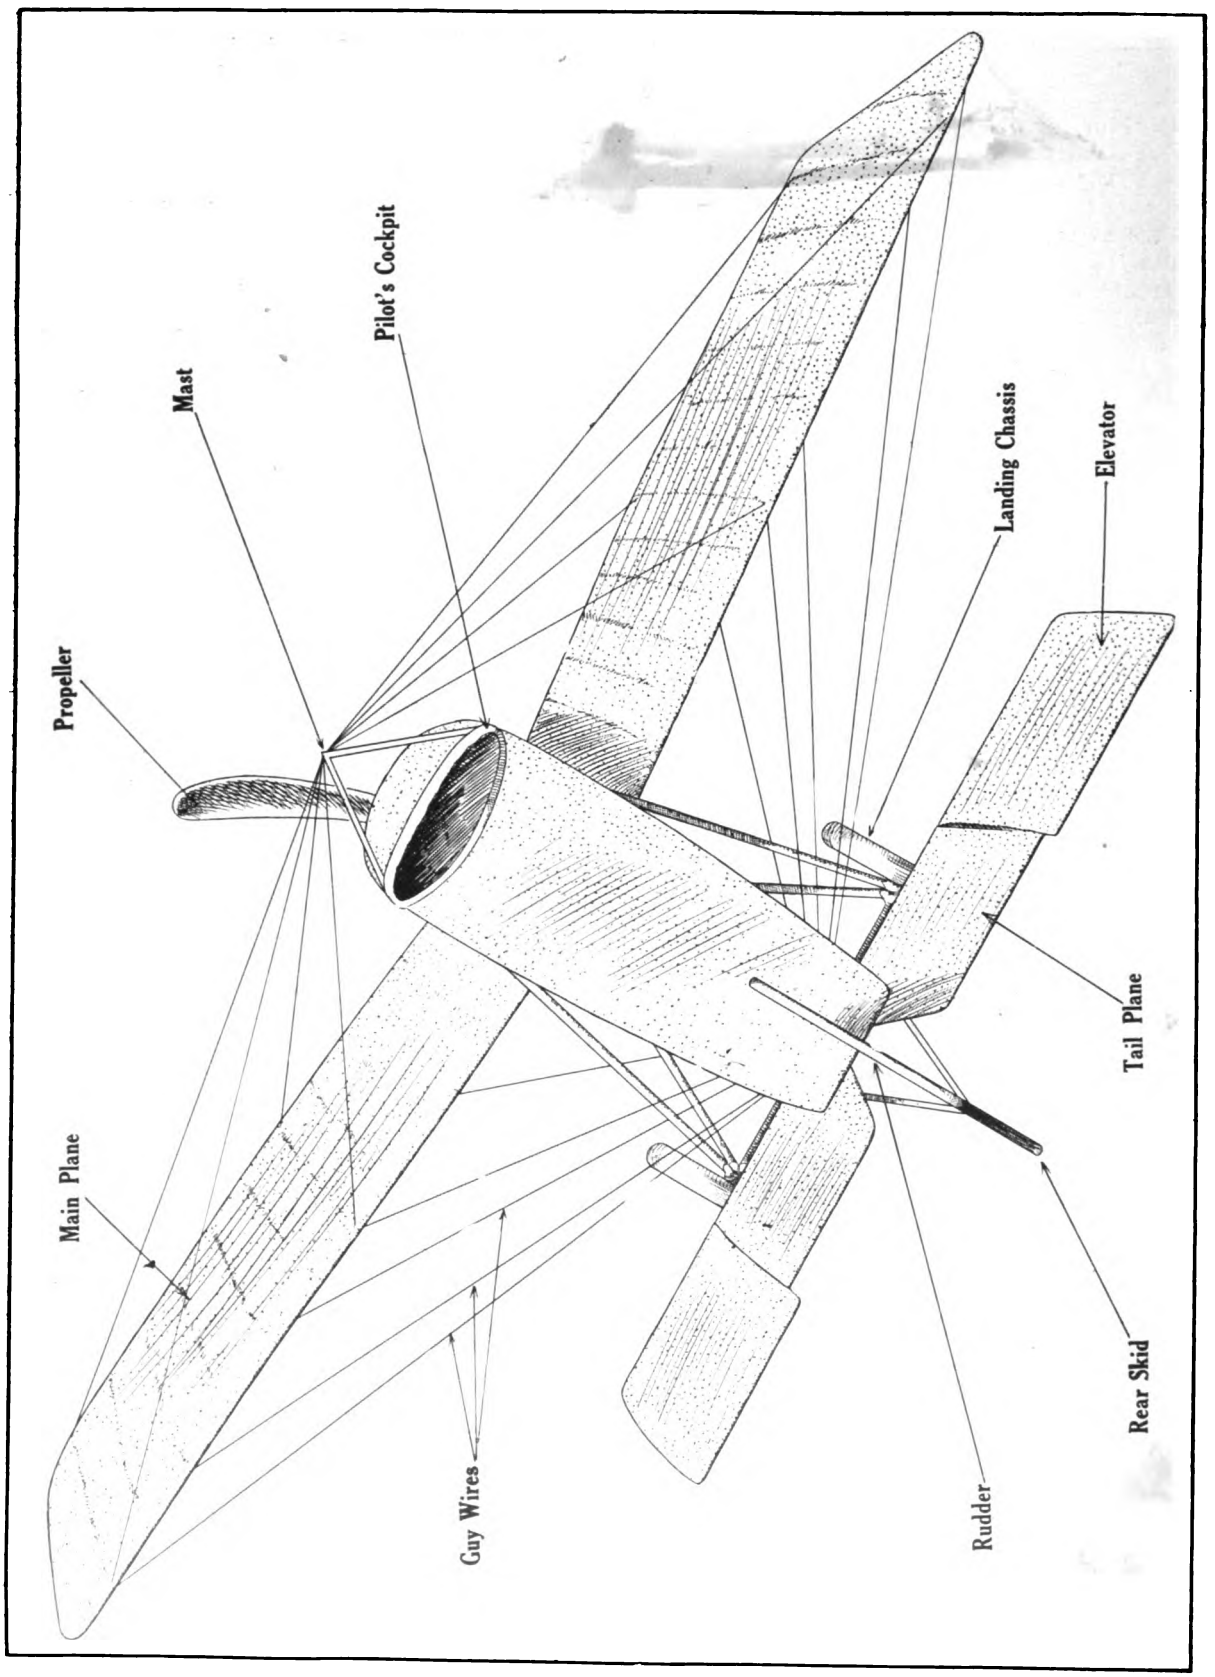
Piston, M. F. Bates, Lansing, Mich. The head of this is removable, being bolted onto the body of the piston.

Direction Indicator, J. A. Givens, Los Angeles, Cal. An arrow on a staff on the front of the automobile is moved to indicate direction by means of a hand wheel located on the dash.

Tire, J. A. Goodman and E. S. Ruff, Stockton, Cal. This contains a protective armor in two overlapping layers composed of plates movably held by eyes, slots and pins.

Saddle for Motorcycles, Edward Lycett, Olton, England. The saddle is connected to the frame by a hinge at the nose and at the rear is supported on rods connected to tension springs attached to the frame.

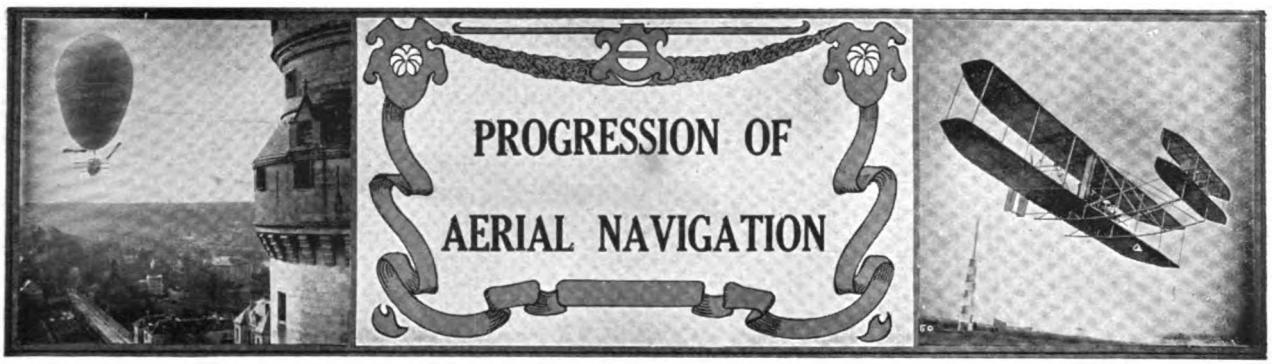
Dumping Body, Thomas Wright, Jersey City, N. J. Bottom converges to the centre, and body may be raised by means of a screw, to deliver the load from the side through a gate.



Cutting Tool, O. T. Anderson, Waterloo, Ia. Specially designed for cutting teeth on worm wheels, the tool has an enlarged head, with spiral threads diminishing in diameter and running back from the end cutting faces.

Pipe Wrench, F. H. Dickson, Oswego, N. Y. Handle is provided with two double reversible blocks each of which bears two hooks which engage the chain after it has been passed around the pipe.

JOHNS-MANVILLE IN LARGER QUARTERS.



On the 54th anniversary of the firm, April 20, the H. W. Johns-Manville Company moved its New York offices and show rooms to the new 12-story Johns-Manville Building at Madison avenue and 41st street. The entire building, a total of 61 acres of floor space, is occupied by the company.

MORANE-SAULNIER RACING MONOPLANE.

Something over a year ago Leon Morane of France decided there was more money to be made in the construction of aeroplanes than in flying them, albeit he had been decidedly successful at the wheel of the Bleriot monoplane, while a member of Louis Bleriot's school of aviation. Several prizes were taken by him and at one time he was among those who were exceeding the altitude record almost weekly. If memory serves correctly, he was the first to fly a machine equipped with a 100 horsepower revolving Gnome engine.

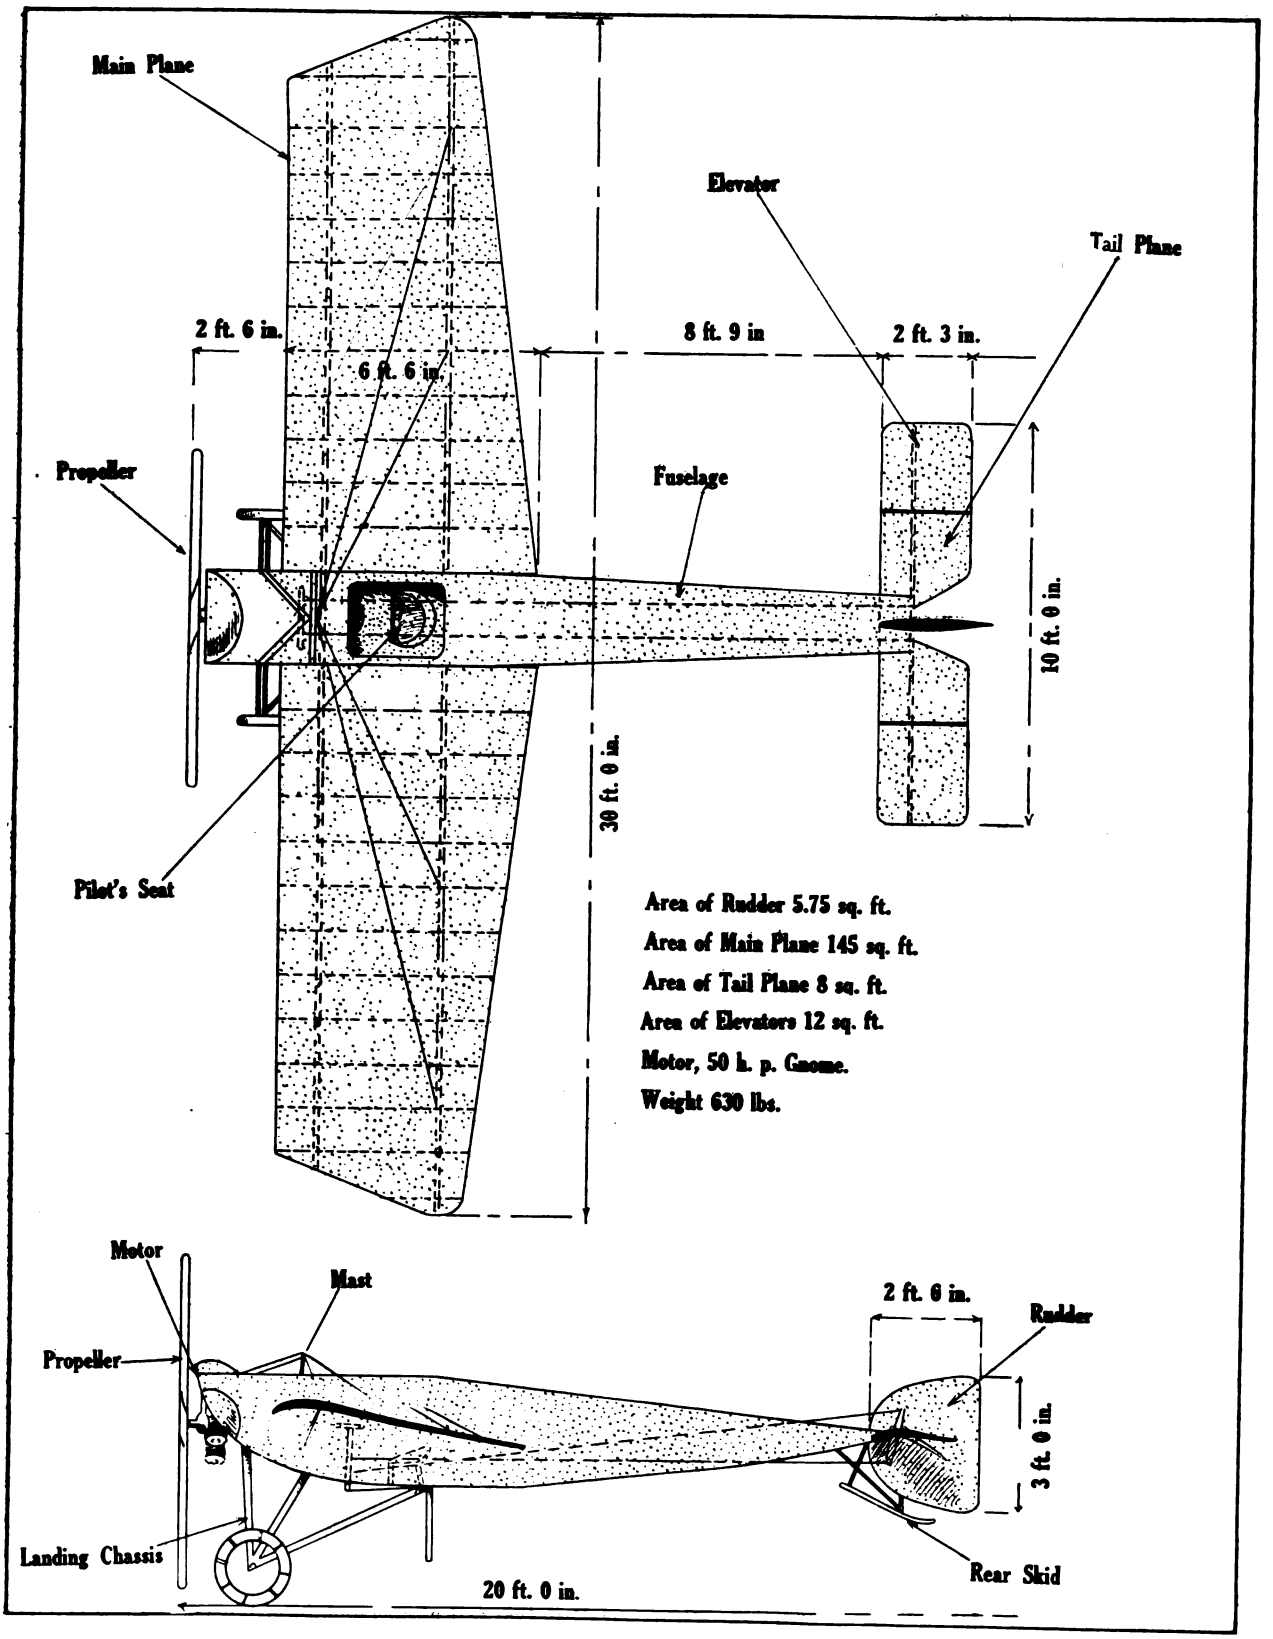
When he decided to become a constructor, the first Morane monoplane followed closely the design of the Bleriot, although there were some very marked differences, particularly in the matter of landing chassis. In his latest design, the racing machine under discussion here, there is much evidence of originality along these lines. In fact, it may be said that the landing chassis in this machine is a decided attempt to eliminate everything of an unnecessary character.

But to return to Leon Morane: Soon after leaving the Bleriot school he identified himself with the Borel firm, and while his first machine was known as the Morane monoplane, the name of Borel soon afterward became identified therewith. While with this concern Morane became associated with R. Saulnier, and recent designs have been the joint workmanship of these two men. Last fall, for some reason, both Morane and Saulnier retired from the Borel factory and started in business together.

The new series is known as the Morane-Saulnier, and comprises no less than four models, the racer, fitted with 50 horsepower Gnome; a school machine, with 35 horsepower Anzani engine; a two-seated military monoplane, with 70 horsepower Gnome, and an all-steel military machine, with gun carriage and 70 horsepower Gnome. It may be added that the last named has still to be given its preliminary tests, so far as is known in this country.

The racing machine has proved very fast in actual work, and already is looked upon as one of the successful designs in the forthcoming French elimination trials to select a team for the fourth international cup race at Chicago in September. During its initial test Jules Vedrines took it to an altitude of 1000 feet on the first attempt, flying 20 minutes at a speed of 78 miles an hour, which is considered decidedly remarkable for a machine equipped with a motor of only 50 horsepower.

It will be seen that it has been designed especially for speed. The chief aim has been to reduce head resistance to a minimum, and in this respect it has been particularly successful. Every detail contributes toward this end, including the landing chassis mentioned before.



The fuselage is enclosed throughout its entire length, the perspective shown herewith, which presents a view from above, bringing out this feature. The pilot's cockpit is the only break, with the exception of the lower portion of the motor housing, this construction being deemed necessary for the proper cooling of the revolving cylinders. So deep is the body at the pilot's seat that he sits well down into the machine, only his head protruding above the fuselage proper. This is done for the purpose of protecting him from the rush of air which strikes the forward part of the machine at great speeds. It follows that the control levers are entirely hidden, and their exact location may be noted from examination of the side elevation.

The construction of the fuselage is of the customary box girder type covered with fabric. From a point slightly back of the cockpit, it tapers gradually in square section to the empennage. The covering for the motor forms a wind and oil shield, which prevents the occupant of the cockpit from becoming spattered with lubricant. This is of steel.

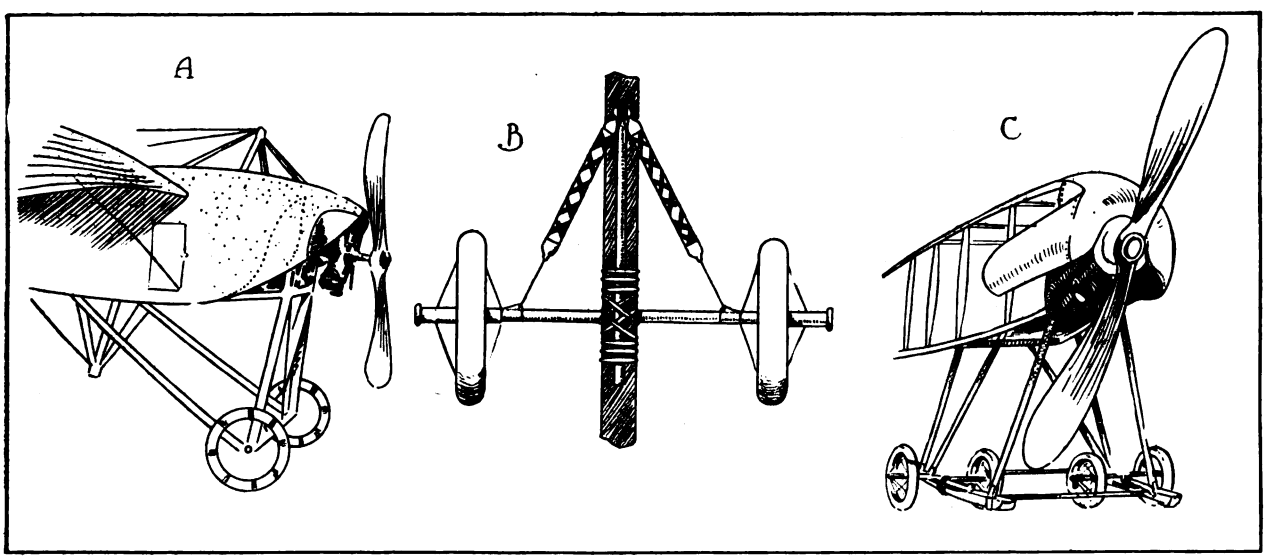
Little change is noted in the design of the main plane, over that utilized in the older machine, now known as the Borel. In plan form the wings are almost analogous to a blade of the Chauviere propeller, which is utilized. The entering edge is shorter than the trailing edge, and it is claimed that the strain felt at the tips is reduced in a great measure by this design, and that it is possible by this means to obtain a more powerful warping effect for correcting balance. The wings are guyed to a mast just forward of the pilot's cockpit and to the middle point of the undercarriage by stranded steel cable.

The empennage consists of a fixed tail plane, or rather two tail planes,one on either side of the rudder, and two elevators. It will be noted that the rear end

Digitized by Google

Plan View and Side Elevation of Morane-Saulnier Racing Monoplane, Showing Detailed Dimensions, Etc.

Digitized by Google



of the fuselage is recessed for a short distance, and that the tail plane fits into this. On either side of the balanced rudder this fixed plane is cut away to permit of easy turning of the former. The plane itself acts the part of a stabilizer, and the rotatable elevators govern the altitude of the machine.

Control of wing warping mechanism and the rear elevators is by a vertical universal jointed lever, of which the action is identical with that of the Bleriot. The rudder is operated by a pivoted foot bar, conveniently located.

As has been stated, the chief interest attaches to the landing chassis, and although Morane first came into prominence as a constructor through his attention to this particular detail, it is somewhat surprising to note the revolutionary character of the design in this respect. It must be remembered, however, that the object sought was a racing machine capable of great speed, and it was not contemplated that it guy wires from the wings are fastened. The running wheels are provided with steel spokes, which may add a modicum of flexibility.

The construction of the other models follows along the same general lines, with the exception of the chassis, which are of the Henri Farman type, in which the skids are upturned in front and apparently are not intended to come into action in landing. The wheels also are mounted in a slightly different manner, as indicated in B and C of the accompanying sketches. The fuel tanks are arranged under the steel windshield, which is heavily padded along its rear edge to prevent any personal injury to pilot or passenger in case they are thrown forward in landing.

The fuselage of the all-steel "war" monoplane is of torpedo form and constructed throughout of sheet steel. From its blunt nose, which is ventilated and which encloses the motor, to a point at the rear of the pilot's seat, this steel body is circular in section,

Some Constructional Features of Morane-Saulnier Monoplanes: A, Landing Chassis and Engine Mounting in Racing Model; B, Diagrammatical Sketch of Landing Gear on Other Types; C, Front View of Two-Seated Military Design.

should be flown except in contests, where a suitably smooth landing place would be provided.

All means for shock absorbing, other than the resiliency of the pneumatic tires, have been eliminated, effectually reducing the head resistance. There is no skid in front, although the tail is provided with a small one. This rear skid takes up some of the shock, so that when the machine comes to a full stop it rests on this at the back, the pair of rubber tired wheels at the front, and a short steel tubular post just back of the pilot's seat.

The chassis itself is constructed entirely of oval section steel tubing. Struts lead from either end of the axle directly up to the lower portion of the engine housing, and backward to the vertical post, previously mentioned. Additional struts lead from the centre of the axle to either side of the engine housing, and it is to the bottom of these struts that the under but from that point to the tail it flattens out horizontally. Even the skeletons of the wings and the rear controlling surface are carried out very cleverly in metal. As said before, no announcement has been made in this country as to the success of this machine in actual flight.

GRAND RAPIDS CLUBHOUSE COMING.

Work on the clubhouse of the Automobile Club of Grand Rapids, Mich., is to begin soon, plans having been completed and contracts for excavation and foundation work having been let. The building will be located seven miles north of Grand Rapids, at Plainfield.

Advocate uniform motoring laws in the interests of pleasant and profitable interstate touring.

MOTORING NEWS OF NATIONAL IMPORT.

New York Motorists Secure Good Roads Man---Inventor of Diesel Engine Here---Activities Among Manufacturers---New Concerns Organized---Haverhill Holds Show---National Association Hold Meetings.

The directors of the New York State Automobile Association held their regular quarterly meeting at Rochester recently and elected Frank D. Lyon, of Binghamton, secretary. Mr. Lyon was formerly deputy state highway commissioner, and has been connected with highway work in New York for a number of years, so that he is one of the best posted men on the situation in the state. In the association he succeeds Mr. Ritchie, who resigned on April 1 to take up another line of work. Mr. Lyon was recently appointed secretary of the executive committee of the National Congress of Good Roads, but was prevailed upon to decline this honor and accept his present position.

The $50,000,000 bond issue, which will be placed before the voters of the state at the coming fall election was considered at the meeting of the directors which elected Mr. Lyon, and plans outlined for a campaign of support for the project. The meeting authorized the executive committee to use every means and all available funds to carry on a publicity campaign to influence and educate the public during the coming summer. The necessity of this additional $50,000,000 to properly carry on the present highway work and to provide for the future will be emphasized.

ENGINEERS IN DETROIT.

Splendid Programme of Entertainment and Discussion Being Prepared for Summer Meeting.

The dates for the summer meeting of the Society of Automobile Engineers, which will be held in Detroit, have been fixed for Thursday, Friday and Saturday, June 27, 28 and 29. The headquarters will be in the Hotel Pontchartrain, where the meeting will be held in the convention hall. Several matters of importance to the industry as a whole will be taken up, although the full programme of papers and matters for discussion has not been announced as yet. Naturally, the members of the society in Detroit are anxious to provide something decidedly out of the ordinary in the way of entertainment; something befitting the centre of the industry, and a programme of entertainment and sight seeing is now in the hands of the following committees:

Entertainment—H. E. Coffin, Hudson Motor Car Company, chairman; H. W. Alden, Timken-Detroit Axle Company; Russell Huff, Packard Motor Car Company. Finance—H. M. Leland, Cadillac Motor Car Company, chairman; Tracy Lyon, General Motors Company. Transportation—F. H. Floyd, chairman; F. E. Sweet, Cadillac Motor Car Company; H. R. Corse, Lumen Bearing Company. Hotels—G. W. Dunham, Chalmers Motor Company, chairman; F. H. Berger, Oakland Motor Car Company; J. G. Vincent, Hudson Motor Car Company.

DIESEL ENGINE COMING.

Famous Inventor Declares Its Suitability for Automobiles and Seeks American Maker.

Dr. Rudolph Diesel of Germany, inventor of the famous Diesel engine, is at present in this country for the purpose of interesting American automobile makers in the utilization of his motor. He declares that within a year it will be adopted as the propulsive agent for motor trucks, and that it is only a question of time before it will be employed in pleasure cars as well. The Bureau of Commerce and Labor in Washington learns that at least one American manufacturer is considering the subject seriously, and while this concern is not engaged directly in the production of vehicles, it is possible that it contemplates future possibilities.

As is more or less well known the Diesel engine was originally produced in 1897. It is built in both two and four-cycle types, and will burn any hydrocarbon from the very heaviest of crude oils to the lighter distillates. It is even claimed that animal and vegetable oils may be utilized for fuel, excellent results having been obtained with both castor and palm oils.

Dr. Diesel delivered an address concerning his motor before the American Society of Mechanical Engineers in New York, April 30, this lecture being under the auspices of the gas power section.

PEERLESS COMPANY EXPANDS.

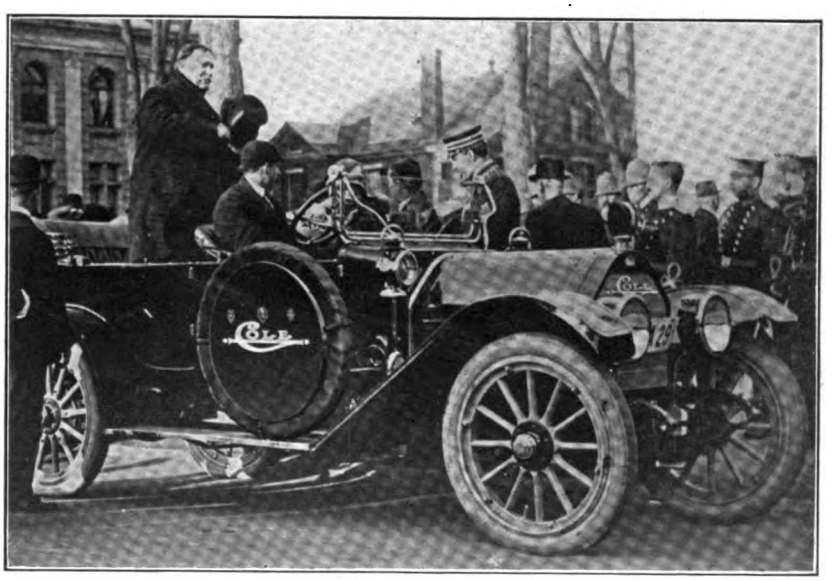
New Stock and Bond Issues Place Liberal Fund at Disposal of Truck Department.

Because of the recent growth of the company's business the Peerless Motor Car Company, Cleveland, O., maker of Peerless pleasure and commercial lines, recently offered for sale to its stockholders only, $300,000 of additional capital stock, which was largely over-subscribed. It also has sold its six per cent.

Digitized by Google

bonds in the amount of $1,100,000, these maturing in installments covering a period of 12 years.

It is understood that the sale of bonds was for the purpose of providing funds for developing and extending the business, particularly to meet the requirements of the commercial vehicle department. The additional capital stock provided money with which to take up the company's floating indebtedness.



PRESIDENTIAL CAMPAIGNING.

Automobile Is Destined to Play Important Part in Political Situation This Year.

Apparently the automobile is destined to play an important part in the forthcoming presidential campaign. As has been true of all political activities during the past few years, those in charge of the various candidates have discovered that in the mechanically propelled vehicles they have a valuable means of covering large territory in a limited time. Heretofore it has been necessary to charter a special train and subject the candidate to the task of speaking from the rear platform at such stations as it was possible to make stops. Nowadays the railroad schedule is eliminated largely, and the automobile takes the speaker to towns which have but one or two trains a day, and the candidate is able to show himself to a much greater percentage of the voters.

The entertainment committees charged with the duty of making plans for the reception of candidates and speakers have little trouble in securing the necessary automobiles, since every dealer throughout the country is quick to appreciate the publicity accruing to him through the use of his car for such purposes. There is another view of the matter as well. Politicians have shown decided unfamiliarity with the needs of motoring in the past, and it is possible that many of them will be led to appreciate the necessity for more uniform legislation and less attempts to discourage the motorist will result. Of course, pre-election promises are easily forgotten, but there is room for hope along this line.

As is well known, President Taft is an ardent and consistent motorist. It does not seem at all out of place to find him in an automobile. In fact, it is to be expected that he will make use of this form of conveyance wherever possible, because he is well aware of the advantages to be gained thereby. An accompanying illustration shows him speaking from the tonneau of a Cole car in Concord, N. H., during his recent visit to that state. It is probable that this will prove one of the characteristics of the present campaign.

President Taft Speaking from Cole Car at Concord, N. H., with W. H. Alexander, Local Agent at the Wheel.

BUFFALO ELECTRIC MERGER.

Completed Organization Discloses Men and Concerns Interested in $1,000,000 Company.

Additional information concerning the organization of the Buffalo Electric Vehicle Company, the announcement of the incorporation of which was made last month, reveals the fact that it is to become a merger of four big business enterprises in that city. The company is capitalized for $1,000,000, of which $700,000 is common stock and $300,000 preferred. The latter has been entirely underwritten by Buffalo people, and a large portion of the common has been taken by capitalists who are residents of that city.

Immediately after the election of officers the concern took over the capital stock of the Babcock Electric Carriage Company, Clark Motor Company, Buffalo Automobile Station Company and the Buffalo Electric Carriage Company. By the purchase of these plants the new concern comes into possession of a splendid factory for the manufacture of electric pleasure vehicles, another for electric trucks and one of the best garages in the city. In addition it takes over the branch houses of the Babcock Electric Carriage Company in Chicago, Cleveland, Rochester and other cities.

The officers are as follows: President, Samuel J. Dark; vice presidents, A. A. Landon and W. A. Morgan; treasurer, Harry Yates; secretary, Alfred W. Thorn; directors, Messrs. Dark, Landon, Morgan, J. T. Steele and W. Van Allen. S. J. Dark, the president, is secretary of the Buffalo Dredging Company and of

Digitized by Google

the German-Bock Asphalt Company, and a director of the Commonwealth Trust Company. Of the two vice presidents, Mr. Landon is president of the Clark Motor Company and superintendent of the American Radiator Company, while W. A. Morgan is president of the Buffalo Taxi Company, director of the Buffalo Copper & Brass Rolling Mill and local manager for Swift & Co.

HAVERHILL'S FIRST SHOW.

Manager Corbett Also Plans Novel Exhibition of Used Cars for Boston During June.

The first automobile show ever held in Haverhill, Mass., was staged in Mt. Washington hall, April 22-27, under the management of O. D. Corbett of New York City, who has been instrumental in the success of several displays of this character in Massachusetts cities both this year and last. Some 25 cars were exhibited, as well as motorcycles and accessories. The attendance was quite satisfactory from every viewpoint, and the number of sales exceeded expectations.

O. D. Corbett, Manager Haverhill Automobile Show.

The general color scheme was pink, white and green, and so artistically were the side walls and ceiling draped with bunting that there was no evidence of these to be had. Streamers of electric lights, encased in green floral shades, extended from the balconies to the ceiling, giving an added touch of brilliancy to the interior. An orchestra of young women furnished music.

The following made display of cars: Lawrence, Inc., Lexington; Hovey & Bagley, Maxwell and Stoddard-Dayton; Jackson Motor Car Company, Jackson; A. G. Willis, Hudson; Sawyer & Dean, Mitchell; W. H. Stevens, National; E. E. Elder, Rambler; M. J. Doyle, American; Empire Motor Car Company, Stutz; Treat Hardware Company, International wagon.

Other exhibitors were: H. E. Sawyer, Pope, Thor and Harley-Davidson motorcycles; George E. Seavey, Indian motorcycles; McCart Company, Martel blowout patches; Meyers Bros., novelties.

As has been stated, Mr. Corbett has been decidedly successful in holding motor car shows in the smaller cities of New England. He is now planning to enter Boston with a decided novelty, insofar as automobile displays are concerned. The proposition has not taken definite form as yet, but he contemplates holding a used car show in that city some time next month. Briefly stated, the idea is to enable the various agencies to dispose of their second hand cars and start the season with nothing but new machines on hand.

MONEY FOR GOOD ROADS.

More Than 1,000,000 Miles of Highway to Receive Attention in Various Sections.

According to the good roads board of the American Automobile Association, more than 1,000,000 miles of highways in all sections of the United States will receive attention of one form or another during 1912, and most of this work can be traced directly to the influence of the self-propelled vehicle. In the spring reports received by this board there is an unusual fund of information to be secured in regard to this matter.

New York, Maine and Pennsylvania will vote this fall on referenda providing for bond issues to be placed at the disposal of the highway departments. In Nebraska, the legislative committee of the state automobile association is preparing three measures, one providing for a state highway commission, another permitting the use of convicts on roads, and a third appropriating money for state aid, these to be presented at the next session of the legislature.

President T. G. Norris of the Arizona Good Roads Association expects the legislature of that state to make an appropriation for this work before adjourning. Similar results are expected in New Mexico. At the annual meeting of the Idaho State Automobile Association steps were taken to pledge the money necessary to complete what is called the Ross Fork sand road, giving a graded highway from Salt Lake City to Island park and on to Yellowstone National park. These organizations are actively engaged in promoting an effort to open this latter park to automobile traffic.

Concurrent with the opening of New Jersey to non-resident tourists, comes the information that the legislature passed three bills during its concluding session, one of which provides for a state system of highways, another for distributing the cost of their construction and maintenance, and the third adding the state treasurer to the highway commission. State Commissioner Stevens has decided to expend $2000 of the automobile money in posting the way from Jersey City to Camden, this being interstate in character, in that it is used chiefly by non-residents in going from New York to Philadelphia and southern points.

TRUCK STANDARDIZATION.

National Association of Automobile Manufacturers Decide to Assist Body Making Industry.

At the meeting of the National Association of Automobile Manufacturers in New York City, May 1, much of the time was taken up in a discussion of motor truck matters. It may be added, as well, that the Federal Motor Truck Company, Detroit, maker of the Federal line, was admitted to membership.

Among other things the association recommended the following standard truck frame sizes: Width, 36 and 42 inches; length, 48, 60, 72, 84, 96, 108, 114, 120, 126, 132, 138, 144, 150, 156, 168, 180, 192, 204, 210 and 216 inches. The object of this action was to arrange matters with a view to providing for interchangeability of bodies, and to enable the body maker to prepare standard stock bodies which may be delivered to the purchaser at once. The desirability of such standards is better understood, when it is learned that there are at present some 88 different models presenting 19 varying widths from 28 to 46 inches, and over 100 models with 41 differing lengths from 48 to 218 inches.

The question of making charge for commercial vehicle demonstration also was taken up, and resolutions recommending the following charges were adopted: Half-ton truck, $10 a day; one-ton, $10; two-ton, $15; three-ton, $20; four-ton, $25; five-ton, $30; six-ton, $30; seven-ton, $35; eight-ton, $35; nine-ton, $40; 10-ton, $40.

FEDERAL REGISTRATION BILL.

American Automobile Association Takes Action Somewhat Reversing Its Former Position.

The action of the executive committee of the American Automobile Association concerning the matter of federal registration at its meeting in Buffalo, N. Y., the last week in April, has occasioned some little surprise. It will be remembered that this association drafted the first federal registration bill presented to Congress and strenuously urged its passage. At this meeting a resolution was prepared by H. L. Vail of Ohio, C. M. Robinson of Connecticut and John Wilson of Pennsylvania, in which it was stated that:

"In the opinion of the members of the A. A. A. executive committee a federal registration act is not only unnecessary at the present time, but against the interests of automobilists of the different states," and "that the imposition of an additional tax for federal registration would be unfair and unreasonable discrimination against users of automobiles, and that the passage of such a law would be most unjust."

It is understood that the resolution was influenced somewhat by the recent action of the New Jersey legislature in opening the roads of that state to non-resident motorists, and more largely by the fact that the bill prepared by this association has been so amended that instead of being optional with motor car owners, federal registration is made compulsory and drastic penalties have been inserted in the bill.

HEADS MARION COMPANY.

J. I. Handley Becomes President of Reorganized Concern Which Increases Capital.

Official announcement is made of the reorganization of the Marion Motor Car Company of Indianapolis, Ind., negotiations which have been under way for some weeks having resulted in the signing of the necessary agreements. The capital of the concern has been increased from $100,000 to $1,125,000, with $625,000 common stock and $500,000 preferred.

Under the terms of reorganization J. I. Handley, until recently vice president of the United States Motor Company, becomes president, and the major portion of the stock is owned by him and John N. Willys, president of the Willys-Overland Company of Toledo, O. It is stated, however, that the new concern is in no way connected with the manufacture of Overland cars, or with the American Motors Company, with which it will be remembered Mr. Handley was long connected as president.

J. I. Handley, President Marion Motor Car Company.

The Marion Motor Car Company, which has been closely identified with the Overland interests for some time past, now becomes an absolutely independent and self-contained organization and will continue the manufacture of two models of touring cars. Within a few weeks, it is expected that President Handley will announce a strong personnel of Marion officers, which, it is understood, he has been recruiting from the ranks of his competitors. In addition, it is stated that plans are under way for the construction of another large and modern plant in connection with that now owned in Indianapolis.

Advocate uniform motoring laws in the interests of pleasant and profitable interstate touring.

THE SERIES V NATIONAL CARS.

WHILE it is remembered that the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, ceased to bring out what is termed the annual model in 1910, the new series V, announcement of which has just been made, is in every particular a 1913 design. It may be added in this connection that the series S, which was announced early in 1911, is continued practically without change, except in such minor details as make for refinement.

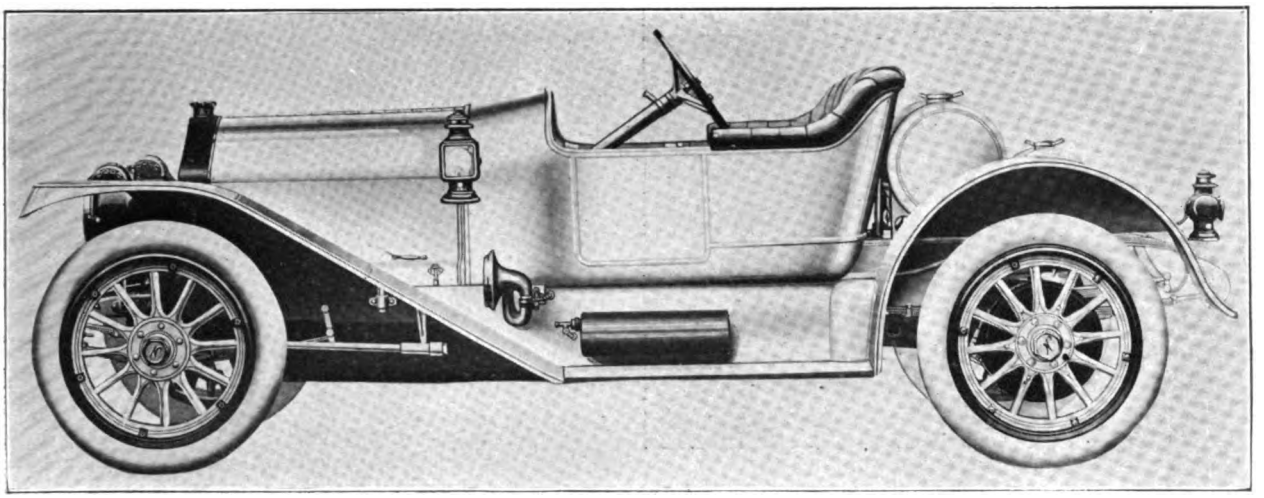
Quality, reliability and service supply the basis upon which the success of the National cars has been founded. For 12 years the manufacturing forces of the National Motor Vehicle Company have had no other standards, and the increasing popularity of this product has been such as to demonstrate that the motoring public recognizes the vital significance of these principles. In presenting series V, the officials of the company are confident that it completely typifies the developing a machine which will meet the exacting requirements of a discriminating clientele. The National 40 may be said to be the result of experimentation in every form of contest—road races, speedway and motordrome meets, beach events, hill climbs, track meets and reliability trials. In each of these it has stood forth pre-eminently as a successful competitor.

The official records for 1911 show that National cars, whether in the hands of professionals or amateurs, secured nine firsts, three seconds and two thirds in road races; 11 firsts, seven seconds and five thirds in speedway and motordrome meets; 20 firsts, 10 seconds and five thirds in beach events; 29 firsts, nine seconds and five thirds in hill climbs, and 15 firsts, 19 seconds and 13 thirds in track meets. Out of 202 entries for the year, cars of this make finished first 83 times; second, 48, and third, 31.

Sectional View of New National Series V Toy Tonneau Model, Outlining the Straight Line Shaft Drive.

aims of all makers of cars in all countries as to power, reliability, design and comfort.

But one chassis is offered, this being equipped with five body designs—a seven-passenger touring, a five-passenger touring, a toy tonneau, a speedway roadster and a three-passenger coupe. The motor is a four-cylinder, 40 horsepower unit, which is extremely noiseless in operation. The bodies are long, low and spacious. The lines are particularly graceful, being strong and straight, with long wheelbase, wide doors, smart sloping hood, large tires, deep luxurious upholstery, and every appointment which makes for comfort and easy riding. The equipment is most complete, including self-starter, gas and electric lights, tire pump integral with the motor, and all the other little niceties which enter into the convenience of motoring.



National cars enjoy an enviable reputation in contest work, and the company considers this of inestimable value, particularly as it has been the means of

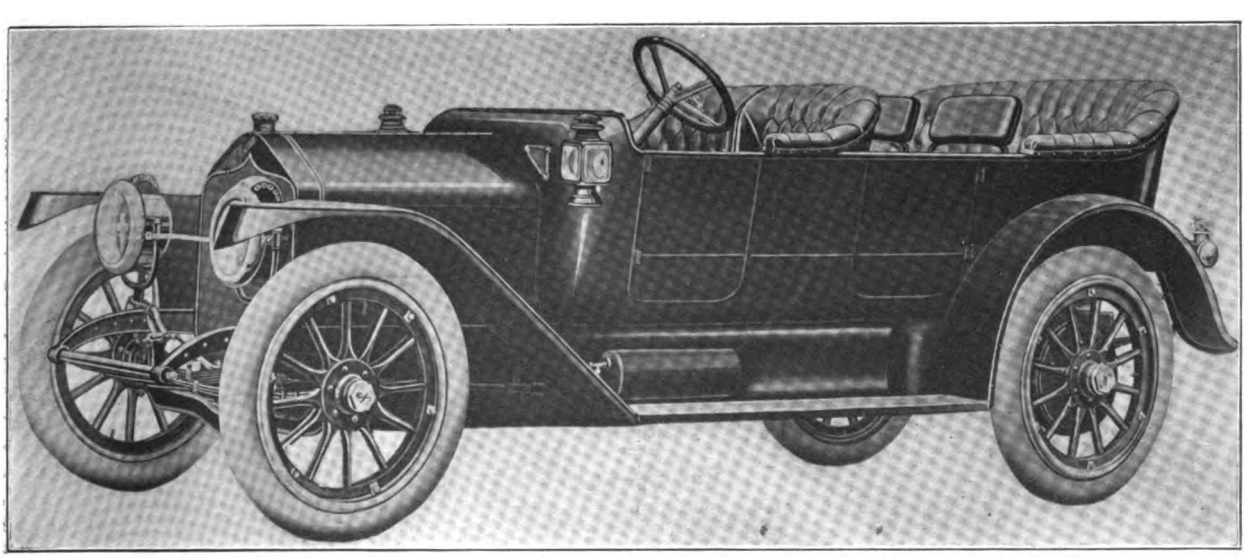
This in itself is a remarkable record. No other manufacturer was able to present a showing in any manner approaching it. It follows that series V represents not only all that modern engineering and designing can produce in the matter of comfort and attractiveness, but it is the result of consistent experimentation under conditions which actually demonstrate its ability to meet the requirements of the most exacting owner.

Constructional Details.

Although several changes in constructional details are noted, these making for quiet operation, durability and accessibility, as well as low cost of maintenance, the series V retains the general characteristics which have become standard with the National. The most striking innovation is the adoption of the left hand position of the driver, which combines the advantages of providing a clear vision of the road in either direction, negotiating corners with safety, easy access to both front seats, etc. However, with this

Digitized by Google

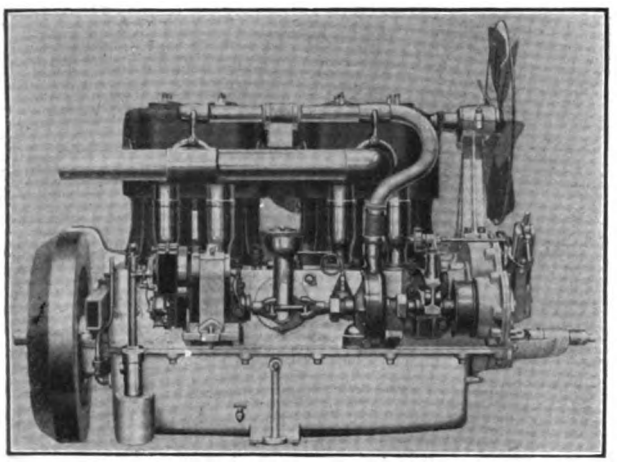
Two-Passenger National Speedway Roadster, with Particularly Low Centre of Gravity and Graceful Body Lines.



the control levers are in the centre, a feature which will appeal to those familiar with the right hand control.

This locating of the steering column at the left has been productive of changing the inlet valves, manifold and carburetor to the left hand side of the motor, the exhaust valves, manifold, water pump and magneto being on the right. The design of the motor has not been altered, the T head vertical, four-cylinder, four-cycle, water-cooled type, so successful in the past, still being employed.

Power Plant.



The cylinders are cast in pairs of a special high grade, close grained gray iron, thoroughly annealed, and the integral water jackets are of ample size, insuring maximum efficiency through proper cooling under all conditions. The practise of utilizing stiffening ribs extending from the water jackets to the base of the cylinders, is still adhered to, a feature making for sturdiness. A slightly longer stroke is noted, the cylinder dimensions being 4.875-inch bore and six-inch stroke, while those of the series S are five and 5.6875-inch, respectively. Although the bore and stroke have been changed, the horsepower is rated as formerly, but it is stated that the series V motor will develop between 15 and 20 per cent. more power than its precedessor.

The design of the piston is the same, the slightly domed head and inside web bracing features being retained. Four eccentric piston rings are located above the wristpin which is secured by a single set screw passing through one of the bosses. Both piston and rings are machine ground accurately to size, insuring a perfect and even compression in all cylinders. The mechanically operated and interchangeable valves are of liberal size, having nickel steel heads, and both

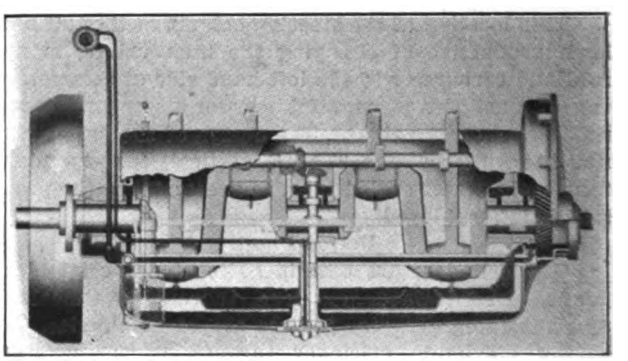
Right Hand Side of Motor, Depicting Location of Magneto, Water Pump and Method of Drive.

the intake and exhaust members and springs are enclosed, a new feature, one making for noiseless operation as well as eliminating dirt and abrasive foreign elements. These housings are of sectional pressed steel, the two halves being held together by a spring clamp device, facilitating easy removal and replacement without the aid of tools. Their bearing is provided by the top of the flanges of the pushrod guides. The latter are fitted with hardened and ground steel rollers, operating in bronze guides. The design is such that perfect alignment is secured and means for proper lubrication are incorporated. The construction throughout insures durability and accurate timing.

The connecting rods are of drop forged steel, having liberal sized bearings of specially designed phosphor bronze, babbitt lined, this bronze retainer being a new feature in the National motor. The crankshaft is of chrome vanadium steel, ground to .001 inch, with extra long bearings, these being die cast Parsons' white bronze. All studs and bolts are made of especially heat treated chrome nickel steel. The crank



Left Side of Power Plant, Showing Carburetor and Method of Enclosing Valves.

and camshafts are retained in the upper half of an aluminum crankcase and the operatng gears are of silico manganese steel, noted for its toughness and shock resisting qualities. These gears are spiral, accurately cut and finished, and operate in a bath of oil, insuring quietness, as well as eliminating friction. The design of the cams is such that an accurate and noiseless operation of the valves is secured as well as correct timing.

Oiling System.

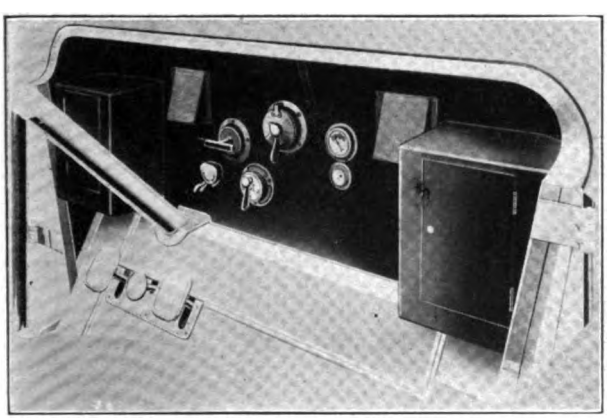
The distinctive National oiling system is retained, the severe tests of hill climbing, road and track contests having demonstrated its reliability under all conditions, as well as insuring the maximum mileage with the minimum amount of lubricant, combining as it does the efficient features of constant circulation and splash. A constant level, force feed oiler, actuated by a gear driven pump located on the right hand side of the crankcase, delivers oil to all working parts of the motor, positively lubricating bearings, gears, etc. The ends of the connecting rods, which are fitted with oil scoops, dip into reservoirs filled with lubricant, and

A Gear Driven Pump Delivers Oil to All Working Parts, Insuring Perfect Lubrication.

constant level is maintained by the surplus oil flowing from these compartments back to the sump located in the lower oil compartment whence it is pumped to the bearings. The crankcase capacity is four gallons, but the roadster is equipped with an auxiliary oil tank on the rear deck containing 10 gallons, with pressure feed to the crankcase.

Carburetion.

The Schebler carburetor is continued, the 1.75-inch size being fitted to all models except the roadster, which is equipped with a two-inch. Vibration is prevented by a metal strap connecting the carburetor rigidly to the crankcase at a point a little forward of the centre on the left hand side of the motor. A Miller carburetor is optional on the roadster, and a Diezemann on touring and toy tonneau models. The design of the aluminum intake manifold eliminates bends and curves thus affording an unrestricted passage of the vapor to the combustion chambers, and like the cylinders, is finished in black enamel. The exhaust manifold and muffler are designed to afford a quiet exhaust with minimum back pressure, the former be-



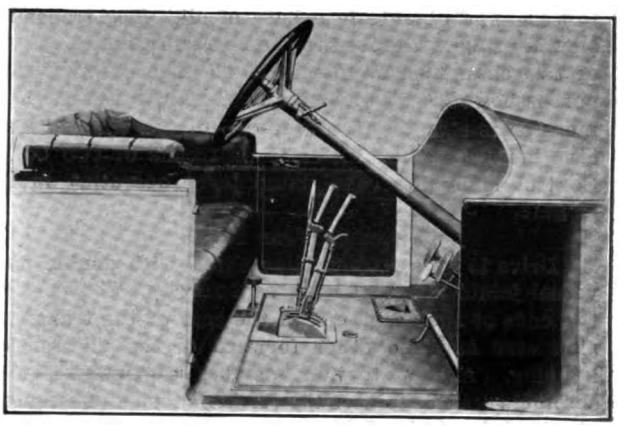
Digitized by Google

ing of liberal size. A feature of the National motor is that no gaskets are utilized, all connections being accurately ground providing perfectly tight joints.

Pressure feed is utilized on the series V models, pressure being secured from a small pump located in the crankcase and driven from the camshaft. A cam actuates a one-inch piston, attached to which by an arm extending from the piston head is a roller held in contact with the cam by means of a spring, .625 inch in diameter. A ball check valve allows the compressed air to pass from the piston barrel on the instroke of the piston to the pipe leading to the fuel tank. The gasoline capacity of the touring and toy tonneau models is 21 gallons, that of the roadster, 30 gallons.

Ignition.

The efficiency of the motor is augmented by new ignition system providing two simultaneous sparks in each cylinder at the gaps of two separate plugs, current being supplied by a Bosch gear driven high-tension magneto having a double distributor. The

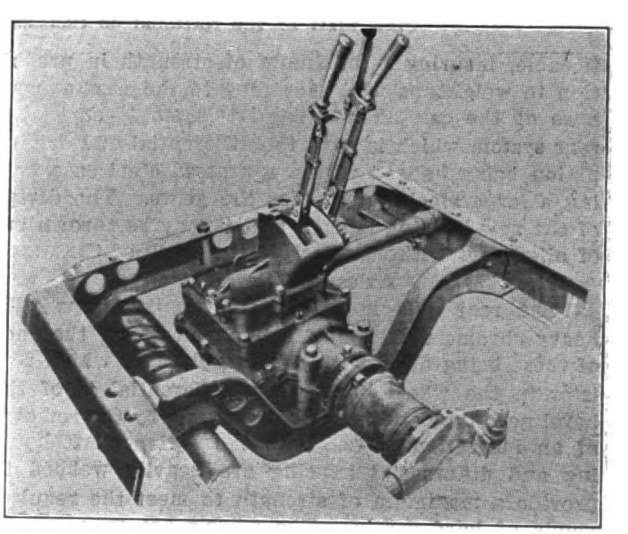


Showing Control Pedals at the Left and Dash Equipment Including Two Lockers.

spark plugs are located in the valve caps on either side of the cylinder heads, this arrangement making for more rapid and complete combustion of the mixture. The roadster is equipped with a double distributor Splitdorf magneto and two sets of plugs. All types utilize storage battery as reserve. Each system, by the utilization of the double distributor, operates both sets of plugs.

Cooling.

The same type of centrifugal water pump is utilized, although it is made slightly larger. This is located on the right hand side of the motor and is gear driven from the half time gears, an extension of the pump shaft actuating a universal coupling attached to the magneto. The cooled water enters the cylinder jackets between the exhaust valves, and after circulating through the jackets passes out between the inlet valves, maintaining a proper temperature under all service conditions. The radiator is the same distinctive cellular type of construction but is supported on trunnions instead of being bolted by means of plates, as formerly, an arrangement making for easy



Driver's Position is at the Left with Centre Control, Permitting of Easy Access.

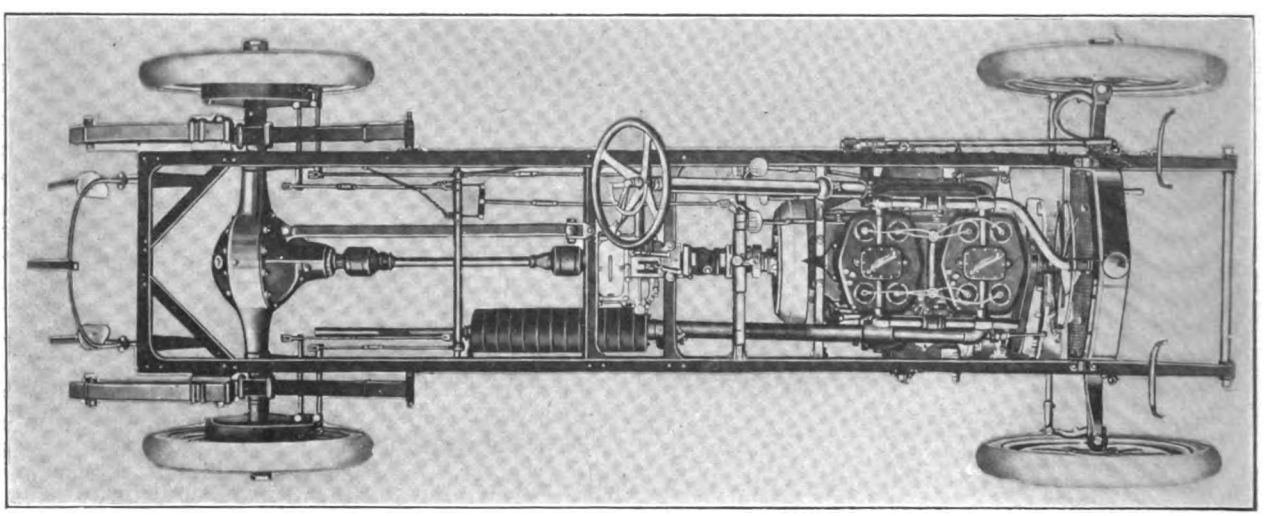
removal and replacement as well as eliminating vibration and road shocks. Cooling is aided by a six-bladed ball bearing adjustable fan, driven by a broad, flat leather belt.

Clutch and Transmission.

The clutch is a self-contained aluminum cone, leather faced and spring cushioned, this giving gradual engagement. The design is such that it may be removed easily without disturbing the transmission. Connection between the two members is by a double universal joint.

A number of changes are noted in the transmission which is of the selective sliding gear type, providing three speeds forward and reverse, direct on the high, as formerly. High grade annular ball bearings are utilized on the main and countershafts. The transmission has virtually been reversed so that the countershaft rotates much more slowly than in previous types, which arrangement with special cutting of gear teeth eliminates all noise when operating at low and intermediate speeds. The gears are constructed of silico manganese steel, oil tempered by a special

Outlining Centre Control and Transmission and Method of Suspension, Making for Accessibility.



Digitized by Google

process, and operate in a bath of oil. The transmission housing is attached to the chassis frame by means of two channeled cross members. The forward support is bowed so as to pass underneath, while the rear member is straight, the rear end of the transmission case being fastened under it by means of two bolts. Control is by the usual hand lever operating in an H gate.

Straight Line Drive.

Drive is by a straight line shaft, with double universal joints instead of one as formerly. They are at the ends of the shaft, one at the rear of the transmission case and the other forward of the differential housing. A new torsion member of pressed steel channel section replaces the former tube, being located on the left of the drive shaft and is attached at its front end to the rear cross support of the transmission case and to the differential housing at its other and larger end.

The utilization of pressed steel throughout is noticeable, insuring a maximum of strength in proportion to weight, as well as adding to the neat appearance of the car. This material is employed in the rear system which is new, the differential and driving pinion being housed within a pressed steel case having a large steel support for the gears. The design of the new housing is such that it may be thrown out of alignment without affecting the mesh of the gears.

Plan View of the National 40 Chassis, Depicting New Torque Rod of Pressed Steel.

Axles and Frame.

The rear axle is of the full floating type with heavy chrome nickel steel driving members, the ends of these being fitted with five jaw clutches which register in the wheel hubs. The differential is of the bevel gear type and is easily accessible by the removal of an inspection plate. Both the pinion shaft housing and differential housing are heavily webbed to provide a maximum of strength to meet the requirements of hard service. The wheels are mounted on a double row of Timken roller bearings on a hollow axle, which carries all the weight, making the removal and replacement of the axles, differential gears, etc., an easy matter.

The front axle is of I beam section and is a one-piece steel forging. The general form has been retained, the centre being bowed. The steering jaws and spring seats are formed integral, the springs being retained by two heavy steel spring clips. Large adjustable roller bearings are utilized in the wheel hubs, also at the tops of the yokes.

The frame is of pressed steel, wide flanged and of 4.5-inch channel section, firmly riveted and is curved up over the rear axle. Diagonal braces are also riveted in place across the rear corners. Sub-frames are not utilized, the motor being secured to the main frame.

Longer rear springs are employed, these being three-quarter scroll elliptic, 50 inches long, 2.25 wide, and constructed of silico manganese steel providing strength and flexibility, as well as adding to the easy riding qualities of the car. The front members are half-elliptic, 40 inches long and 2.25 wide. The forward end of the rear members is retained by brackets attached to the frame side rails and held securely by three heavy steel clips. Provision is made for ample lubrication of spring bolts through grease cups.

Steering System.

The steering system is of the worm and gear type with ball and socket connections to the steering knuckle and an 18-inch wheel is fitted to the steering column which is inclined in accordance to the model. The cross connection is located back of the axle, protecting it from possible damage, and the draglink is fitted with ball and socket joints and spring checks to absorb road shocks. The quadrant on which are located the spark and throttle levers, is placed above the wheel, while the auxiliary air valve lever is on the column just below the wheel and convenient to the operator. The dash control of the air to the

Digitized by Google

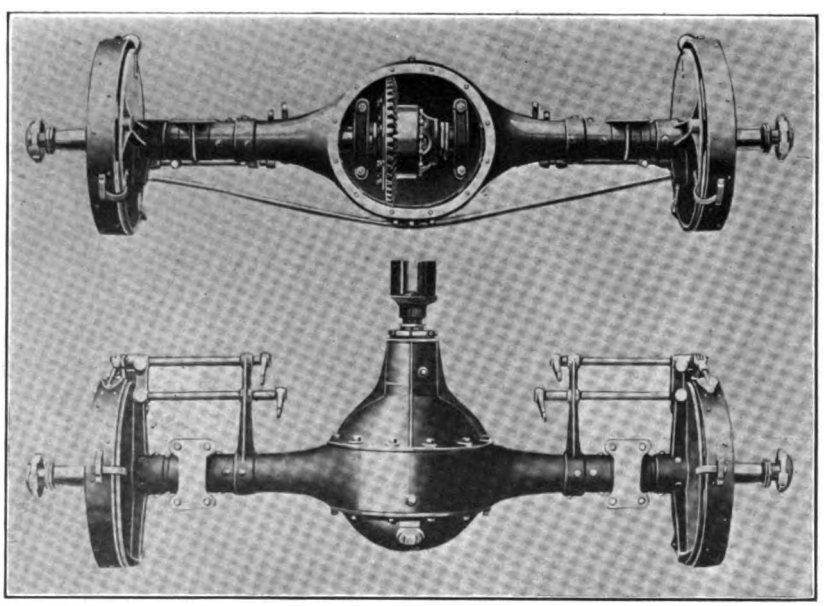
carburetor is retained, but the auxiliary air valve on the intake pipe has been altered, a small poppet valve being utilized in place of the sleeve device. The lever on the steering column opens the poppet valve against a spring which retains the valve on its seat in the usual manner.

Brakes.

Two sets of brakes are utilized, the service being of the internal expanding type, operated by pedal, and the emergency external contracting, actuated by hand lever. The same diameter, 16 inches, is retained although the width is greater, affording additional frictional surface. The metal-to-metal system has been replaced with Thermoid, a special brake lining. Both brakes are located on the rear wheels, are so designed as to prevent dragging and are adjusted easily. Brake energy is imparted through adjustable steel pull rods of ample size and an equalizing rocker shaft carried within the chassis.

The clutch, brake and accelerator pedals are located on the floor in the same position as in previous models, although improvement is noted in the fitting of an aluminum heel rest to make easy the operation of the accelerator when traversing rough roads.

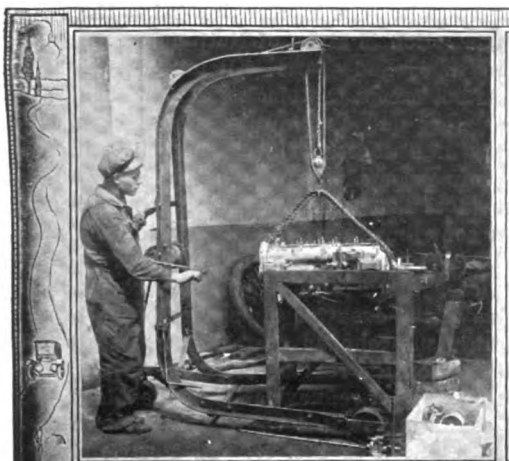
The wheels are of wood, artillery type, of carefully selected material, and the use of larger tires is noted, the speedway roadster being fitted with 34 by 4.5-inch shoes; the toy tonneau and five-passenger touring, 36 by 4.5, and the seven-passenger touring, 36 by five. Firestone demountable rims are standard equipment on all models, with option of five makes of tires.



The wheelbase of the touring cars and toy tonneau has been lengthened from 124 to 128 inches, that of the roadster remaining the same, 120 inches. The gauge is standard, 56 inches, although an option of 60 inches may be had for southern roads.

On all models except the roadster, rectangular fuel tanks are carried at the rear, being suspended from the frame and with the touring models provision is made for carrying extra shoes at the rear by means of substantial, adjustable tire irons attached to the rear cross frame member. In all fuel tanks fine wire mesh strainers are incorporated for separating gasoline and water.

A very noticeable and striking feature of the fore-door bodies is their low and attractive appearance, this being partly due to the fact that they are suspended 2.5 inches lower than formerly and to the distinctive and advanced design, this being along lines of a noted foreign body builder. A high grade of sheet metal is utilized, contributing to the exceptionally high grade finish, the stock color being National blue, although option is given of National green, maroon and gray body and gears. All metal trimmings are nickel plated, except the black enameled radiator.



The upholstery and appointments have been carried to a very high degree of perfection in the touring and toy tonneau models, 10-inch upholstery being utilized instead of five as formerly and special Turkish cushions contributing to the comfort of the passengers. Finish is either dull or bright black leather. Two small boxes fitted with locks, are provided on the inner side of the dash for the safekeeping of articles, and within the tonneau there is a coat rail and leather protector on the rear of the front seat.

The same degree of refinement is noticeable in the equipment, consisting as it does of a self-starter and tire pump in addition to gas, oil and electric lights, Prest-O-Lite tank, horn, tools, jack, tire irons, two storage batteries, etc., all of which is included as standard. Tire pump is of the single-cylinder type and is located on the left side of the motor and in front of the exhaust camshaft gearcase. It is actuated by a cone clutch, which is thrown into engagement only when its use is desired, and operating as it does within the camshaft gear, makes a simple and compact arrangement. The clutch is connected with the crankshaft of the pump, the piston of which is actuated through a five-inch connecting rod. The piston is 1.375 inches in diameter and has a stroke of three inches. Air is admitted to the cylinder for compression through a small spring seated poppet valve which is opened by suction created by the down-stroke of the piston. Air is taken through openings in the flat sides of the hexagonal nut which secures the valve housing to the cylinder head.

The Full Floating Type of Rear System Is Entirely New with National Cars, and Is Designed to Withstand Severe Service.

USEFUL HINTS FOR REPAIRMEN

Handy Ways of Doing Work and Practical Ideas Picked Up in a Round of the Repair Shops, or Contributed by Workmen

A GEARBOX REPAIR.

The repairman is called upon frequently to exercise his ingenuity when making a repair on a car the owner of which objects to the expense of a new part or to losing the service of the machine. At Fig. 1 is depicted how a gearbox was repaired. The recess in the aluminum holding the bronze bearing had worn oval shaped, owing to the retaining screw having been left out in a previous overhaul or repair, and the bearing having revolved with the shaft. The method illustrated was adopted to obviate the necessity of reboring the aluminum and making and fitting a new bearing.

The bronze member was removed and a lining fitted accurately as shown in the sketch. Four .25-inch holes were drilled and tapped in the aluminum casing and four set screws fitted, these being utilized to adjust the bearing, as well as to line up the shaft and its gears. A paste was then made of clay and the inside and outside faces of the bearing covered with this material. White metal was next poured through the oil hole, filling up the oval space, after which the heads of the set screws were cut off. The metal filling the oil hole served as a retainer for the bearing, a new hole being drilled for the purpose of lubrication.

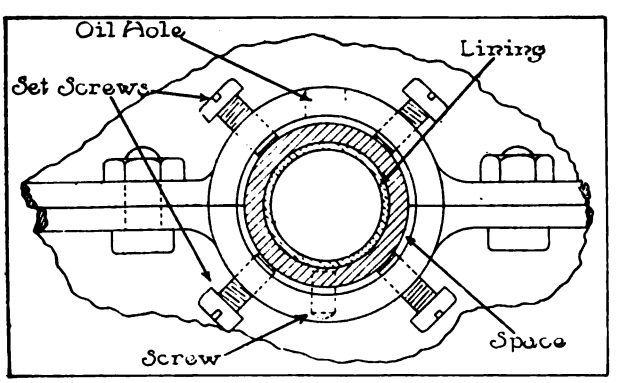

Fig. 1—Depicting How Loose Bearing of Gearbox Wore Casing, and Method of Repairing Damaged Part.

SMALL REPAIR SHOP METHODS.

With the rapidly increasing number of motor cars in service, both for pleasure and business purposes, means must be provided for their care and maintenance. There is and always will be a demand for repair shops employing skilled workmen and in this respect it may be stated that the small shop, when properly equipped, may compete successfully with the larger and more established concerns. Many of the latter began operations in a small way with one or two workmen and through diligence and practical methods built up a profitable business.

Many competent workmen, thoroughly familiar with the motor car and its needs, have endeavored to establish a business of their own but although their work was entirely satisfactory to the trade as employees, they have failed to attain success in their new venture because of a lack of executive ability. Four or five skilled mechanics might decide to establish a repair shop, and while capable of undertaking and completing successfully any work, might fail to hold their trade because of a number of reasons, some of which will be outlined herein.

Example of Failure.

Assume that three expert repairmen form a partnership in the repair business. One is particularly efficient upon motors, while the second makes a specialty of the components of the chassis, is a skilled machinist and fully capable of handling any work of this nature. The third member of the firm is a general all-around man, clever at locating motor car troubles as well as proficient with ignition and carburetion. Such a combination should be able to establish a paying business.

It is natural to presume that the nucleus of the new trade will consist of those owners who have followed the workmen from their former place of employment. Personal solicitation and friendship also proves a valuable asset in securing a large clientele and in a short time the new firm appears to be established upon a sound basis and its members are working overtime, including Sundays.

Digitized by Google

Leaks and Overhead Expenses.

To reduce the overhead expenses as much as possible the new concern dispenses with a bookkeeper, one of the firm filling the office, the only salary paid out being that of an apprentice who runs errands, cleans the cars and acts as an assistant to each workman. From the start the company, although having a good equipment of tools, has been obliged to secure supplies and material which makes deep inroads into the capital.

At the end of the month the firm proceeds to take an account of its financial standing, and although the books show that the business for the month has been all that could be desired, there appears to be a shortage of ready cash, and it is probable that one member of the company will begin to compare his financial standing with that of the past when on Saturday he received his envelope with its regular sum of money and frequently its contents were swelled by reason of overtime.

A month later the firm discusses its business. Although all have been working overtime to turn out the work and new customers have been secured, after paying the lighting, power, telephone and supply bills, it may develop that the amount of cash available when divided into three parts, proves to be a small salary and particularly discouraging when the overtime labor is taken into consideration. The books show a handsome profit, but many of the outstanding accounts are hard to collect and several are discovered to be almost worthless.

As a result the clerical member of the firm takes an account of supplies and goes through the books and begins to check up material and compare that on hand with that charged. He is apt to discover that there are many leaks. The books show that during the month 500 gallons of gasoline were purchased and that 200 were charged up. The tank reveals but 250 on hand, leaving 50 gallons unaccounted for. The oil question is next looked into and a similar discrepancy discovered. Other supplies also show a balance on the wrong side of the ledger, small amounts it is true, but when figured on a yearly basis they total a considerable sum.

Lack of System.

The bookkeeper decides to check up stock at the close of each day. It has been customary for each workman to make up his time slip and material account at night, relying upon his memory for details. Taking each slip the bookkeeper compares the charges with stock of fuel and oil and discovers a shortage of five gallons of gasoline. One member of the concern recalls having put this amount in Mr. Blank's car. Another refilled the crankcase of a motor and told the boy to enter it at the office. Another sold a gallon and put the change in his overalls. Although each member resolves to remedy the faults, the errors occur frequently, eating into the profits.

The new concern also learns that considerable diplomacy is required in handling customers and that some of its trade is taking work to other shops, the result of one member completing work ahead of an-

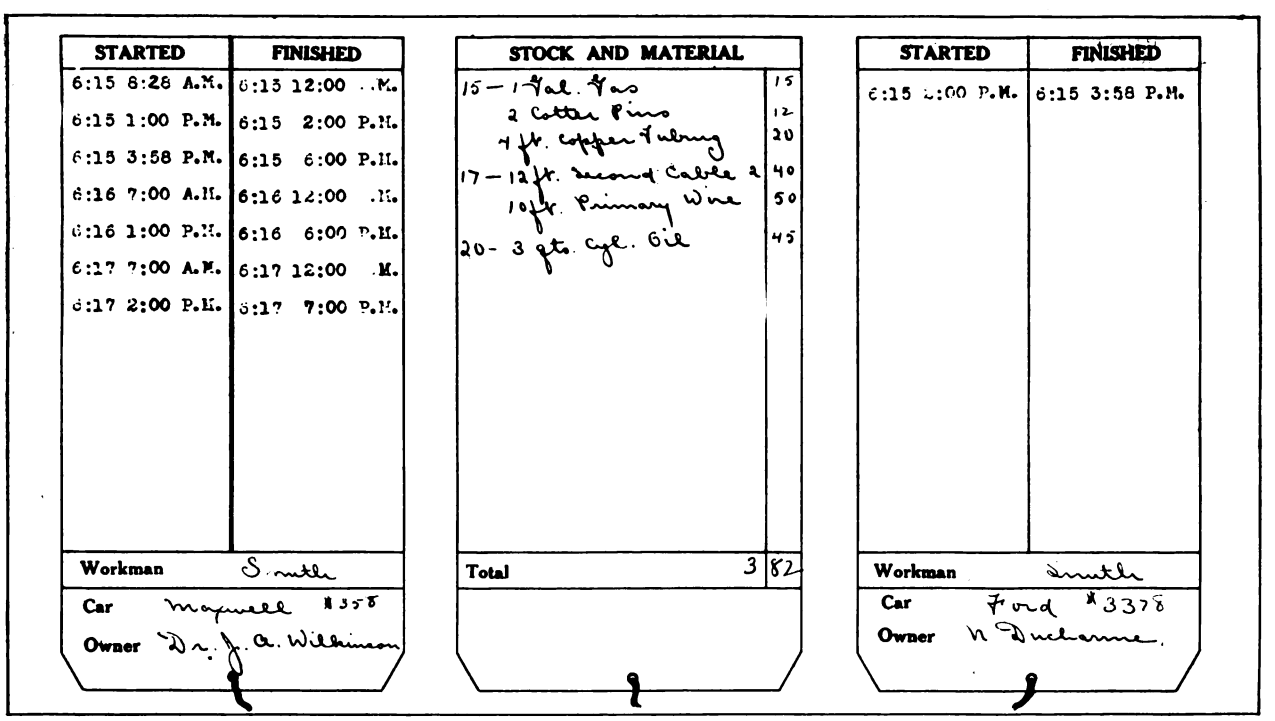

Fig. 2—Depicting Time and Labor Checking System, Showing Start and Finish of Work, Reverse Side of Card for Material, and Tag for Workman Called Off to Attend Another Customer—It Will Be Noted That Each Minute Is Accounted for by the Time Stamp.

Digitized by Google

other customer whose car should have been turned out first. Work promised is not delivered on time, creating dissatisfaction, as well as numerous other minor difficulties which could have been avoided if the firm in its anxiety to please had been more conservative in its estimation of time and labor.

Need of Management.

A small concern operating under these conditions will not be successful, unless one member possesses executive ability and the others agree to conform to his orders, discussing each step before it is taken. While such a combination is capable of accomplishing satisfactory work, it must have the proper management. The same workmen, when employed under a capable foreman, in a large shop, observe the rules and maintain the system in vogue. They have their instructions and follow them.

The writer personally knows of cases where a skilled repairman established a shop of his own and for a while was very successful, but failed to hold his trade because of his lack of executive ability and diplomacy. Unconsciously he favored certain customers, which was noted by others who naturally became dissatisfied. This same workman, who later became identified with a large concern, was one of their best employees, giving perfect satisfaction to customers he failed to please when in business for himself.

Labor and Check System.

It is conceded by those familiar with the operating conditions of the repair shop employing two or more workmen that more or less difficulty is experienced by the proprietor in keeping an accurate account of the time and material utilized by the employees. This is meant to apply to the shop not equipped with a system, and which is experiencing a steady growth of business compelling the owner to add to his force from time to time and especially during the busy season.

Under such circumstances the new men are prone to emulate the example of the older employees in making up their time at the end of the day's work, which if it consist of 10 hours results in like number being charged up to one or several jobs as the case may be. Material and stock is charged in a similar manner. Operating under such conditions is bound to be costly to the proprietor in more ways than one.

Faulty Time Keeping.

Not only is the workman liable to forget minor charges, but if he is called upon to work on a number of jobs during the day he cannot very well remember the exact amount of time on each unless possessing a wonderfully retentive memory. If the workmen compute their time at the completion of the day's work, they are interested only to the extent of accounting for 10 hours' labor, a method which may be satisfactory to the proprietor, but not to the discriminating customer.

For example: Mr. Brown brings his car to the shop to have the valves ground and wants his machine that afternoon. Being a good customer and the work permitting, the job is promised, and Mr. Brown sees the work started. An hour afterward he passes the garage and notes the same repairman working on a car in the street. Repassing the place still later he finds the street job is not yet completed. That afternoon Mr. Brown gets his car and asks for his bill. He notes the time for labor and does a little figuring and is of the opinion that he is paying for some of the other owner's work. An investigation results in the workman "remembering" working on the other car. The bill is corrected, but Mr. Brown is developing an idea that he has not been given a square deal or else that the shop is not conducted in a business manner.

Sometimes it happens that a customer disputes the amount of labor on a job and demands an itemized account. These little difficulties are not uncommon and often a recourse to the courts is had to obtain an adjustment. Although to be regretted, it is a fact, nevertheless, there are many arguments over repair bills which might have been avoided if the shop maintained a system by which the owner could be shown an itemized account of the time and material, also that he could not be charged for labor not his or due to the absent-minded or careless workman.

Such a system should include means for checking the time of the workman hourly and in fractions thereof, as well as for all material and stock utilized. In large shops cards or sheets with duplicates are employed and the small details looked after very carefully. In the event of disputed work the records are valuable as evidence.

Many shops hesitate to install some systems because of the expense and necessary clerical labor involved. With small garages, employing three or four men, the proprietor may keep the books and attend to many small details usually looked after by the bookkeeper, etc. With such a concern the system should be as simple as possible yet provide accurate means for checking up the labor and material.

Clocking System.

At Fig. 2 is outlined a system which would not be expensive to install, and in addition to keeping an accurate account of the time spent on each job, would serve also to check up the time of the workmen; that is, denoting the time they began and finished each day. It requires a form of time clock which provides for stamping the month, day, hours and minutes, a device employed by many firms to register the time orders or letters are received and answered. This clock is located in or near the office and is fitted with a rack for each workman, also another holder containing blank cards.

Assume that Dr. Wilkinson drives up to the shop and makes arrangements to have his motor overhauled. The proprietor instructs Smith to start on the job the next morning. Smith is given a copy of the orders entered upon the order book, and upon arrival the next morning takes a blank card and stamps it in the clock device. Smith was late that

Digitized by Google

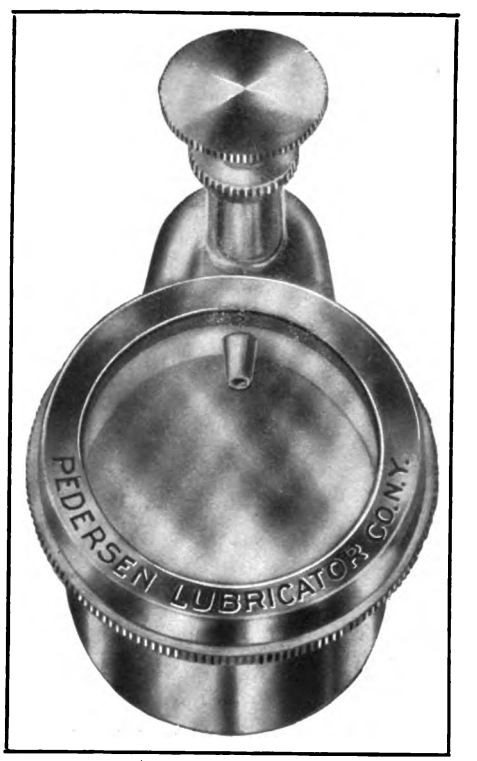
morning, and the "started" side of the card shows he began work at 8:28. At noon he stops, stamps his time and leaves the card in his rack, restamping it upon his return.

At 2 he is called off by the foreman to do a little work on Mr. Ducharme's car, who has just driven up. Smith goes to the time clock, stamps his card, places it in its holder, takes a new card and stamps it at 2, and enters Mr. Ducharme's name, the type of car and its number, before proceeding to work. At 3:58 he completes his task, returns to the clock and stamps the card denoting that the work was finished at that time. He also stamps the card bearing Dr. Wilkinson's name at 3:58 and resumes work on that job, but leaves Mr. Ducharme's card in the rack. At the completion of the day's work at 6 the card is again stamped and left in the rack from which it is taken by the bookkeeper, entered on the day book and replaced on the clock.

The reverse side of the time card is utilized for entering the stock and material used, the prices of these being carried out and added up by the bookkeeper, and entered in the day book or ledger. The total time is figured easily as well as that of the workman. Upon the completion of the work the card is taken into the office, entered and filed away for reference.

By utilizing a separate card for each job, whether it be for 15 minutes or several days, the customer is assured that some other owner's car is not being repaired at his expense. In the event of a workman requiring the aid of another for an hour or fraction thereof, the time card will show the double time and how utilized. Should the customer desire an itemized bill of the labor, it is made up easily. One time card could be employed for a job taking several days or a separate one utilized each day as desired. The system could be made to fulfill a number of requirements and to make it successful it would only be necessary to insist that each workman use a card in connection with the clock upon starting and completing each job, as well as for working hours.

CLUB PLANS CHEAP INSURANCE.



The Benson Automobile Club, Benson, Minn., is planning to give the automobile owners of Swift county insurance at less than the 2.5 per cent. figure of the regular companies. The full plan and rates have not been made public but it is stated that the first assessment is to be $5, if paid before the loss of a car insured under the plan is reported. The system is to extend to motorists outside the county if it prove successful. The club may be remembered as the one which originated the $1 road post sign for the State of Minnesota.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

THE PEDERSEN LUBRICATOR.

A new sight feed indicator of novel design is presented in the accompanying illustration, this being of the bull's-eye type, but in addition is provided with a special device so that the oil can be regulated and observed from the seat. It is the product of the Pedersen Lubricator Company, 636 First avenue, New York City, and is used in connection with its small rotary pump on oiling systems as applied to different makes of cars, and particularly with the model T Ford.

The pump used in combination with this sight feed has an overflow or bypass valve, so that when the lubricant is reduced by means of the adjusting screws on the indicator, or is entirely shut off, it circulates through the pump, in this manner avoiding any excessive pressure in the piping and possible leakage at the joints. The adjusting screw is provided with two check nuts, so that when the proper regulation for ordinary running is obtained, these nuts may be located, and when it is desired to give the motor a little extra oil, the screw may be turned, and the original adjustment obtained at once.

The Pedersen Lubricator.

The type utilized on the model T Ford is attached to the timer shaft without making any alterations whatsoever.

NEWARK TO BE QUIET.

Newark, N. J., has passed an ordinance aiming to stop the excessive use of loud horns thus joining the ranks of the anti-noise cities. The ordinance prohibits signals louder than necessary to be heard over ordinary conditions of traffic, and provides that they are to be sounded only when necessary as a warning of danger. Muffler cut-outs are not mentioned, as a state law prohibits their use.

Digitized by Google

CORRESPONDENCE WITH THE READER

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Question of Compensation.

(1366)—Please inform me what it is worth to take care of an automobile in the owner's garage, the work involving washing, polishing, replenishing the supply of fuel and oil and inflating tires when needed?

E. L. TRAVIS.

Washington, D. C., April 28.

There are a number of conditions to be considered, such as how many times the machine will have to be washed and polished and how particular its owner is as to its appearance, also how much service will be required. Garage charges vary from $5 a month for dead storage, where the owner takes care of his own machine and pays for the washing and polishing, to

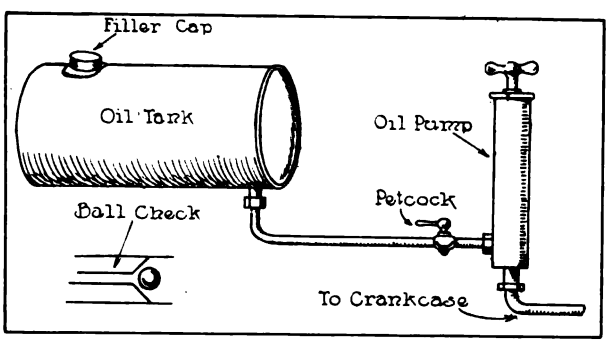


Fig. 1—Auxiliary Oiler for Pumping Lubricant to Crankcase of Motor.

$30 a month for full care. The price for the work mentioned varies from $1 for a small runabout to $2 for a large machine. Charges for live storage are $15 upward, depending upon the size of the automobile and location of the garage; that is, in some cities the cost of garaging is considerably more than others. Regarding the salary, this would appear to be a subject in which the owner would be interested as well as the caretaker.

Firing Order of Motor.

(1367)—Will you explain why a four-cylinder motor fires 1, 2, 4, 3, or 1, 3, 4, 2? I would like to know why the explosions take place in these orders instead of 1, 2, 3, 4.

WILLIAM SHAKESPEARE.

Waltham, Mass., April 28.

The object of a four-cylinder motor is to produce power by a series of impulses of frequent occurrence rather than a lesser number of stronger explosions. The arrangement of the components is such that while one cylinder is firing, those next in order are compressing, exhausting and inspiring a fresh charge respectively, and at the end of the power stroke, the piston that has just compressed is ready to transmit the power produced by the explosion of the gas and keep the crankshaft revolving.

The construction of the crankshaft of a four-cylinder motor is such that two pistons are up while the other two members are at the bottom of the stroke and the explosions instead of occurring simultaneously during one stroke, and then waiting till three idle strokes had taken place before repeating, are spaced equally, one occurring each half revolution of the crankshaft in the following order, for example, 1, 2, 4, 3. As two pistons are going up while two are going down, the parts are mechanically balanced, one set of moving parts weighing exactly the same amount as the other.

With the motor firing as above referred to the piston of the No. 1 cylinder would be at the top of its stroke ready for firing. That of the No. 2 cylinder would be at the bottom of its stroke or ready to compress its charge of mixture. The piston of the No. 3 cylinder would also be at the bottom of its stroke, but about to expel the burnt gases on the exhaust stroke. The piston of the No. 4 cylinder would be at the top of its stroke about to descend for the intake of the mixture. When exploding 1, 3, 4, 2, the only difference is that the No. 2 cylinder is exhausting and the No. 3 compressing, or reverse to that of the firing order 1, 2, 4, 3.

Parts for Pope-Toledo.

(1368)—I have a Pope-Toledo in my care and wish to know where I can get parts, instruction book and diagrams of engine, transmission and differential. I do not know what model or what year the machine was made. It is a seven-passenger, has a rocker arm valve movement with mechanical inlet valves, double chain drive. Would like to know how to time the valves and magneto. If you can give me some information on same would greatly appreciate it.

CLYDE ADAMS.

Bentonville, Ark., April 17.

The Pope Manufacturing Company, Hartford, Conn., will doubtless supply the desired information. It is customary to mark the motor or components of the chassis and these will be of assistance in writing the concern above referred to. While a general valve

Digitized by Google

timing diagram could be published in these columns it is best to obtain the timing from the maker.

Fitting Auxiliary Oiler.

(1369)—I have a ——— car which gives excellent service but believing in using plenay of oil am writing for advice upon the installation of an auxiliary oiler. The oiling system of the machine is splash and the lubricant is poured in through an opening in the crankcase. After running about 50 miles the gauge does not show enough oil to suit me. I frequently take long trips and have to stop to replenish the oil. Is there not some way I can supply the oil without leaving the seat?

OSCAR L. MERTON.

Canton, O., April 29.

While it is an excellent idea to use enough oil too much results in the car smoking and creating trouble with the spark plugs as well as causing carbon. The writer knows of several machines of the make referred to and their owners have not experienced any trouble as they follow the direction of the maker. A force feed or mechanical oiler may be installed and the Pedersen Lubricator Company, New York City, makes a device adapted for this machine. It pumps the oil in proportion to the speed of the motor, is attached easily and is not expensive.

At Fig. 1 is presented a suggestion for pumping oil as desired to the crankcase. It consists of an oil tank, metal tubing, a petcock and an oil pump. The tank may be mounted inside the dash and should be higher than the pump to obtain a flow of lubricant to the latter by gravity. A pump may be secured having a petcock or the latter inserted in the line as shown in the drawing. To utilize the device, the petcock is opened and the pump handle pulled up, which will take in a charge of oil. The petcock is then closed and the handle depressed which will force the lubricant to the crankcase. As the pump is made in several sizes and stated capacities, the amount of oil pumped to the crankcase could be computed easily.

If it is not convenient to mount the oil reservoir above the pump, the former may be attached to the side of the car and ball checks employed, these being so fitted as to allow oil to be drawn into the pump in the direction as denoted by the arrow in the illustration. When the pump handle is depressed the ball will be forced against its seat preventing the lubricant from returning to the reservoir.

Making Asbestos Gaskets.

(1370)—In overhauling my ——— car I spoiled the asbestos gaskets used between the exhaust manifold and cylinders. The bolt holes are very close to the edges of the manifold and in trying to fit the gaskets have broken a large number, as the asbestos crumples and tears easily. Have tried several ways without success. Can you suggest some way to make them without using up considerable of the material? J. V. D.

Houston, Tex., April 30.

Asbestos, especially if thin, is difficult to handle unless one be familiar with the material. As the manifold is of iron the gaskets may be made easily by taking a piece of asbestos of the desired thickness and slightly larger than the part of the manifold. The asbestos is then placed upon the latter as depicted at Fig. 2 and held securely while the sharp edges of the metal, as shown by the dotted lines in the drawing, are tapped lightly with a ball pein hammer. The blows will cause the metal to cut through the asbestos so that the gasket proper will be separated easily from the piece. This is a method utilized by repairmen in turning out gaskets for cylinders, etc., as it insures a perfect fit.

In cutting out gaskets for aluminum members care should be exercised, as the metal is broken easily. In fitting these gaskets they should be smeared with a paste composed of powdered graphite and oil which will enable their removal without damage, thereby saving the trouble of making new members. If more than one gasket is essential for the same port member, because of any variation of the manifold, the members should be cemented together with shellac

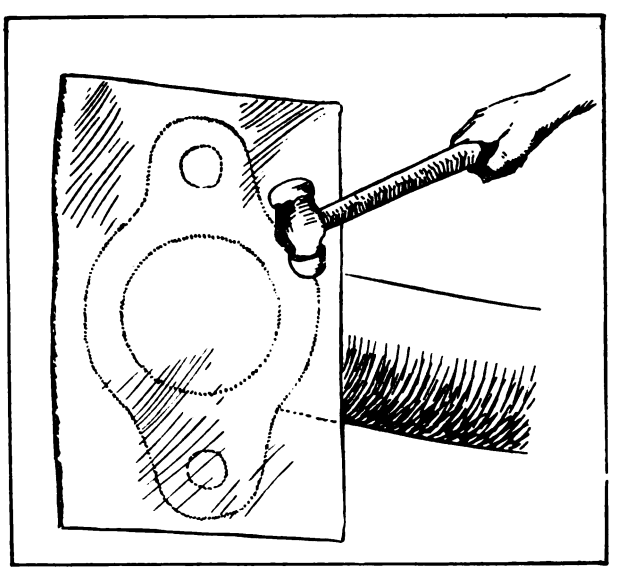

Fig. 2—Outlining Method of Cutting Out Asbestos Gaskets with Ball Pein Hammer.

and the graphite utilized on the exterior surfaces, as previously outlined.

Series and Multiple Series Wiring.

(1371)—I have noticed reference made to series and multiple series methods of wiring batteries, and that when dry cells are wired in multiple more current is obtained and that it is the best way, as it is cheaper. Will you kindly explain the difference between the methods and why more electricity is secured?

CHARLES KENYON.

Portland, Me., May 3.

A single dry cell of standard construction is capable of developing only 1.5 volts and has a capacity ranging from 15 to 23 or more amperes, the amount varying according to the make. It may be explained that the voltage represents the strength of the current and the amperage the flow or amount.

If voltage be desired, for example, six or eight volts for operation of a coil utilized for ignition purposes with the motor car, a number of cells would be

Digitized by Google

connected together by what is known as a series connection; that is, so that the current flows through the cells in succession each increasing the voltage of the preceding cell by an amount equal to its own voltage. Thus six cells wired in series as depicted at the top of Fig. 3 would give six times 1.5 volts or nine volts. Connecting cells in this manner does not increase the amperage or quantity of current, but rather decreases the amount as the resistance is increased by the series connections, cutting down the current flow.

To increase the rate of current flow, the cells are connected by what is termed parallel, in which all of the zinc terminals are connected in one group, and the carbons in another, each terminal wire being connected to all of the battery terminals of the same kind as indicated in the second row. When cells are thus wired the voltage is the same as of a single member, but the amperage is increased by an amount equal to the product of that of one cell multiplied

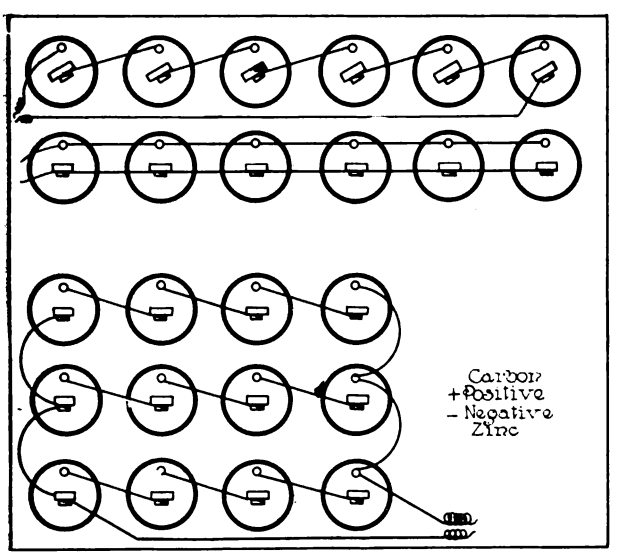

Fig. 3—Explaining Wiring of Dry Cells, Six Being Connected in Series; the Same Number Wired Parallel, and 12 in Multiple Series.

by the number of cells. Single members, or groups in series, may be connected in parallel, and these groups may be considered a single cell of large voltage.

When series groups are in parallel the combination is known as series parallel or multiple series. This arrangement is shown at the bottom of the illustration in which three groups of four cells in series are depicted connected in multiple. The total voltage in this instance is equal to that of four cells in series, or four times 1.5 equals six volts, and the rate of flow is equal to three times that supplied by one series group. If the cells be connected to an outside circuit requiring a given amount of current, the demand on each battery is one-half of that on a cell in a single series group.

The advantage of the multiple series is that the demand on the individual cells is reduced thereby increasing their life, and at the same time the desired voltage is obtained. The efficient output of a single group of cells in series is usually limited to one-quarter ampere, and by placing two such groups in parallel it is possible to secure double this value or one-half ampere, and with but one-half the demand upon the batteries. The greatest efficiency from dry cells is obtained when the lowest discharge rate in amperes is obtained. Any number of cells may be connected in multiple series and by increasing the groups of series the service will be augmented proportionately.

Lubrication of Motor.

(1372)—Please inform me which is the best make of oil to use with an automobile engine? I have a Ford car and last year used a standard make of lubricant. This year I purchased a cylinder oil less well known. Do you think it is a better oil for a Ford machine?

ELIZA B. HART.

Princeton, Mo., April 24.

It is poor policy to change from a recognized high grade oil to a new product because of its attractive price, as the experiment may prove costly. It may be pointed out that the difference in cost at the end of the year will amount to a few dollars at the most, while on the other hand, should the new lubricant not perform its function properly, the repair bills would be greatly in excess of the net cost of the highest priced lubricant on the market.

It is poor economy to experiment with lubricants, and it will be noted that every manufacturer recommends the use of a recognized standard oil for his motor car. The experienced automobilist is not misled by the attractive literature and prices of unknown concerns, and adopts a high grade lubricant and continues its use thereby effecting economy.

Representative manufacturers of lubricating oils have conducted exhaustive experiments and tests to ascertain the best grade of lubricant to meet each and every individual requirement, be it for automobiles, motorcycles, motor boats, aeroplanes or stationary engines, and this information dealing with every make of automobile will be mailed free upon application. The product of these makers is sold in cans or barrels bearing their name and trade mark and the buyer is thus assured of protection in purchasing. By referring to the Classified Buyers' Guide in each issue of The Automobile Journal, the names and addresses of the leading representative makers of cylinder oils and lubricants may be ascertained.

VANGUARD COMPANY EXPANDING.

The Vanguard Manufacturing Company of Joliet, Ill., has doubled its capital stock, now having a total of $50,000. The number of directors has been increased from three to five, the new members of the board being W. H. Whitmore and William Thoeming, who join C. F. Jensen, Edward Steinhart and Nathaniel Hurd. A new and larger factory is to be purchased for the manufacture of Vanguard windshields.

ADVANCES IN MOTOR CAR LUBRICATION.

THE following discussion is prepared by Harry Tipper of the Texas Company, New York City. The subject is one of decided interest to motorists and they will no doubt welcome the opportunity to consider it from Mr. Tipper's viewpoint, particularly as he has had long experience with the manufacture and sale of the product which he analyzes.

(By Harry Tipper.)

It is one of the curious features of the automobile industry that the importance of proper lubrication has, up to the present, hardly been appreciated by the average motor owner and indeed the manufacturer of the motor car. The utmost care is taken in securing the very best materials for the manufacture of the car so that the minimum weight can be combined with the maximum strength and durability. An immense amount of time and trouble is spent in ascertaining the character of the materials necessary to make the car most efficient in all directions, and almost all manufacturers of cars and accessories maintain extensive laboratories for the purpose of investigating the possibility of further improving these materials.

When the car has been built and put in service its durability, the absence of expensive repairs and the proper running depend almost entirely upon the method and material used in the lubrication. Given a well built car in the first place and outside of accidents, there is practically only one reason for excessive depreciation or imperfect service, and that is the quality of the lubricant employed and the method of getting it to the parts to be lubricated.

Considered from this standpoint, it is somewhat astonishing that so little progress has been made in the science of lubrication of internal combustion engines and that so much unsuitable material still has a wide sale for lubricating purposes. This is probably due to the fact that this science is quite complex, and the consideration of oils to suit the requirements has been approached almost entirely from the commercial marketing proposition and not from the scientific end. Moreover, for many years, it was only possible to secure one class of oil for this purpose and the users of lubricating oil for internal combustion engines were limited to that extent in any consideration of the problem.

The question to be considered is not whether the lubricating oil is of a certain gravity or answers other arbitrary tests of this nature, inasmuch as these tests have practically nothing to do with the suitability of the lubricant for the reduction of friction and the elimination of wear. The question at issue is: What are the practical requirements to be demanded of an oil in order to fulfill the purpose of lubrication in an internal combustion engine both in regard to the cylinder and the bearings? These requirements, briefly stated, are as follows:

The lubricating oil should maintain a film in the bearings and between the piston rings and walls of the cylinder at the temperature of such bearings and cylinders as to reduce the friction to a minimum and prevent undue wear.

As some portion of the lubricant used in the cylinders may get past the piston into the compression chamber where the explosion takes place, the lubricant should be of such a character that it will burn up completely in the compression chamber without leaving any troublesome carbon deposit of a hard and flinty character.

As the oil must be used under exposed conditions in cold weather, it should be such that it will not congeal at the reasonably low temperatures which may be encountered.

It will be observed that none of these requirements relate to the gravity of the oil, which test merely indicates the weight of the oil compared with the weight of the water, and does not illustrate the lubricating qualities in one way or another. Consider for a moment the requirements as stated above.

The necessity for maintaining the films in the bearings and between the piston rings and walls of the cylinder indicate that the oil should be sufficiently viscous at the crankcase temperature to prevent its being pressed out or escaping from the bearings, etc. An oil which is not sufficiently viscous for this purpose will not be a good lubricant.

As cars vary in regard to the size of bearings and crankcase temperatures, according to the make and character of the engine, the requirements vary in this regard to this extent. The crankcase temperature, however, is usually quite a little lower than the temperature in the cylinder, and the necessities for bearing lubrication make it a distinct advantage if the oil is more viscous at the temperature of the crankcase than it is when it reaches the cylinder.

If the oil at temperature of the cylinder is calculated to maintain a film between the piston rings and the cylinder walls, so that the proper compression is secured and the lubrication of the cylinder carried on without undue wear, the increased viscosity secured from this character of oil in the bearings will have the advantage of giving more complete lubrication to these parts and at the same time eliminating some waste of oil.

It is obvious that, in lubricating the walls of the cylinders, some oil will get past the piston into the compression chamber. If a troublesome carbon deposit is to be obviated the oil should in the explosion of the motor be sufficiently low in flash point so that it will be consumed along with the explosive mixture and pass out as part of the exhaust gases.

It has been common practise in the lubrication of internal combustion engines to consider of special value an oil with a high flash point, this high flash

Digitized by Google

point being supposed to obviate the deposit of carbon by preventing the combustion of the oil. This practise has arisen from an entire misconception of what takes place in the compression chamber when the explosive mixture is fired. The temperature in this compression chamber at such a time will reach approximately 2000 degrees, Fahrenheit. At this temperature the highest flash oil which can possibly be produced would of necessity be burned up, with this difference—that the combustion in this case is not complete, as the character of the oil is such that in the short time taken up by the explosion when the compression chamber reaches this high temperature, complete combustion of the high flash oils cannot be secured and a certain portion of the free carbon contained in the oils is deposited upon the piston head, spark plugs, etc.

In Europe the manufacturers of motor cars, and the users of these cars in general, have come to a very much better appreciation of this point than we have in this country, the Russian oil from the Baku fields, which has an appreciably lower flash point than oils of the character of the crudes found in the northern states being generally used for this purpose. These oils are to some extent used on this side and evidently have been successful as they bring prices on the market which are almost double those ordinarily obtained for motor oils.

Oils of the same character as the Russian crudes can be obtained readily in this country, as those secured on the Gulf Coast in Texas, and some of those found in California have the same general characteristics. As a matter of fact, the asphaltic base crudes, as these are termed, have shown pre-eminently the qualities necessary for the most economical lubrication of internal combustion chambers, and the old bugbear—that these asphaltic base crudes, on account of the asphalt which is contained in them carbonize to a greater extent than other crudes—is disposed of entirely by the concrete evidence which is developed in actual practise. It should be stated that the refining conditions in the manufacture of lubricating oils from these crudes necessitate the extraction of the oil from the asphalt so that, before the lubricating oils are ready for the market, the entire quantity of asphalt contained has been removed.

Further, the conditions have demonstrated that the deposit of carbon is due entirely to incomplete combustion in the compression chamber. This has no relation to the actual percentage of free carbon which may be present in the lubricating oil, but is entirely a question of the possibility of converting the hydrocarbons of the oil together with this free carbon into gases of combustion. It has been demonstrated many times under all conditions that this is secured with the lower flash oils from the Texas and Russian crudes.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

NEW CONCERNS IN INDUSTRY.

Several new concerns have been organized for the purpose of constructing mechanical transports, and in one or two instances it is noted that well known wagon makers are taking up the manufacture of motor driven equipment. Among the latter may be mentioned the Geneva Wagon Company of Geneva, N. Y., which has held an enviable position in the older industry for a number of years. This concern will produce but one chassis, to which two types of bodies will be fitted, one having a capacity of 2100 pounds and the other 2300. The motor employed is a two-cylinder, opposed unit, water-cooled, located under a short hood in front of the dash. The horsepower rating is 20, with a bore of 5.125 inches and stroke of 4.5.

The F-S Motors Company has been organized in Milwaukee, Wis., for the production of a new light delivery car to be known as the F-S. It is understood that the backer is the Filer & Stowell Company of that city, which already owns a controlling interest in the Beaver Motor Company, the Petrel Motor Car Company, and other important concerns in that vicinity.

The Driggs-Seabury Ordnance Corporation, which is more or less well known through its connection with the parts industry, has been engaged in the construction of 20 motor trucks, which will soon make their preliminary tests. Three models will be produced, in capacities of three, four and seven tons, respectively.

A new concern has been organized in Clyde, O., to be known as the Krebs Motor Truck Company, for the purpose of manufacturing the Krebs truck of 1500 pounds capacity. It is understood that the motor will be a two-cylinder, two-cycle unit with bore of 4.5 inches and stroke of 5.5.

A. B. Perkins, his three sons, and G. E. Porter of Bay City, Mich., have organized the Wenonah Motor Truck Company, which will place in the market the Wenonah truck in two models, one of 1000 pounds and the other of 1500.

The Ewbank Power-Transmission & Motor Company, Portland, Ore., which was organized in December, is about ready to present its truck, and it is said that other products will include motor propelled fire apparatus and railway equipment. The basis of the new vehicle is a gasoline-electric traction system designed by H. B. Ewbank, Jr., which involves the use of separate driving motors for each rear wheel, speed control being accomplished through the regulation of the engine. The officers of the company are: President, S. M. Mears; vice president, George W. Stapleton; treasurer, R. S. Howard; secretary, Dr. H. B. Ewbank; chief engineer, E. H. Ewbank, Jr.

The Henry Manufacturing Company, maker of the Blitzen self-starter, has opened a branch in Chicago at 1120 Michigan avenue, which is in charge of Frank S. Murray.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

The Motorcycle Situation.

The present condition of the motorcycle industry is such as to reflect great credit upon the present and future popularity of the sport of motorcycling and the mount itself, and while the manufacturers have done their full share to bring this about, they doubtless will agree with the officials of the Federation of American Motorcyclists that its aims and efforts have done much toward the consummation of this object. It is a well known fact that the federation always has stood for the encouragement of the use of motorcycles, but for the past three years it has been working along intelligent lines and with the full co-operation of the makers.

Ninety per cent. of the 250 clubs affiliated with this national body is actively engaged in increasing interest in the two-wheeled mount. Eighty five per cent. of the 630 official repair shops are very much in evidence along the same lines. Several hundred individual members and club organizers are contributing their share. No one interest can lay claim to all the credit for the advancement of this cause, or for the present very high repute in which it is held.

Annual Herring Run.

Each year the official activities of the Providence Motorcycle Club, Providence, R. I., may be said to open with the annual herring run to Taunton, Mass., so-called because it is held at that season when the herring run up the river, a sight which is sufficient to cause many people to visit Taunton. About 125 riders assembled in Exchange place, Providence, April 28, for this event. Not all departed at the same time, and this accounts for the fact that when the camera man took the accompanying picture not all of the 125 were to be seen.

It is estimated that there were more than 300 riders in Taunton that day. Invitations had been issued by Secretary J. G. Edwards to all the clubs in the vicinity, and many accepted from Boston, Lynn, Brockton, Fall River, New Bedford and various other places. After watching the herring for a time, all were invited to the Taunton Cyclery, which is operated by Beauvais Bros., agent for Indian machines, where the members of the party became the guests of B. A. Swenson, Providence Indian agent for Rhode Island, at an elaborate lunch.

The Providence Motorcycle Club's season was thus opened officially, and from now on each Sunday will witness a run to some nearby point. The next really big event will be the house warming at Motorcyclists'

Part of the Members of the Providence Motorcycle Club at Exchange Place, Providence, R. I., Ready to Leave on the Annual Herring Run.

Digitized by Google

Fred Peterson of Providence, R. I., and His Indian Mount.

Rest, the new club rooms in the Swenson building, now nearing completion at Broad and Blackstone streets. The club is increasing in membership very rapidly, and expects to be one of the largest and strongest in the country before the summer is well under way.

Nearing the 15,000 Mark.

The number of new members admitted to the Federation of American Motorcyclists during April was 841, bringing the grand total now in the organization to 14,361. According to Secretary G. B. Gibson of Westboro, Mass., these new members were divided by districts as follows: Atlantic, 289; Lake, 221; Southwestern, 89; New England, 82; Pacific, 51; Central, 41; Peninsular, 39; Insular, 16; Gulf, 12 and Canadian, one.

Classified according to states, the result is as follows: New York, 175; Ohio, 116; California 84; Massachusetts, 72; Pennsylvania, 49; Indiana, 42; Washington, 40; Illinois, 38; New Jersey, 33; Kansas, 26; District of Columbia, 25; Florida, 22; Philippine Islands, 16; Missouri, 16; Rhode Island, eight; Iowa, seven; Montana, seven; Maryland, six; Georgia, six; Tennessee, six; Kentucky, six; Michigan, six; Alabama, five; South Dakota, five; Texas, four; Wisconsin, three; Minnesota, three; Colorado, three; Oklahoma, two; Idaho, two; Oregon, two; New Hampshire, one; Connecticut, one; North Carolina, one; New Mexico, one; Utah, one; Canada, one.

Brewer Gets Bidwell Trophy.

John Wilmont Brewer defeated 15 other starters in the race for the Bidwell trophy over the 17-mile course on the Long Island motor parkway, April 23. J. U. Constant was second and F. L. Vanderpool, third. All three rode Indians. There appears to have been some trouble in deciding the contest, not because of position of the riders at the finish, Brewer being at least 50 yards ahead of Constant, but because Constant refused to allow the referee to examine his machine. The second prize has been held up by Dr. Thornley, chairman of the competition committee, pending an examination of Constant's mount, and apparently no definite time is to be announced until later.

Indianapolis Track Plans.

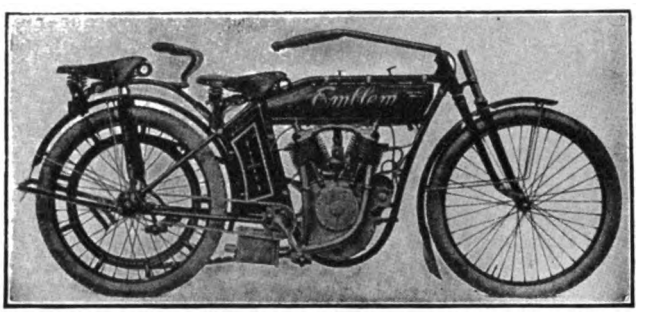
Jack Prince and W. A. Gibson of Indianapolis, the latter local manager for the Empire Tire Company, Trenton, N. J., have leased 41 acres of land near the entrance to the Broad Ripple amusement park in Indianapolis, for five years. A new board motorcycle track will be constructed at this point, and it is expected that the opening meet will be held May 25, followed by another immediately after the 500-mile automobile race on the speedway, May 30.

Chicago Gets Championship Race.

Announcement has been made that the annual two-mile national amateur championship race will be held on the Hawthorn track at Chicago, May 30, in connection with a race meet which the Chicago Motorcycle Club is planning for that date.

Fast Enough to Catch Emblem.

The Columbia Photographic Society of Philadelphia has brought out a new fast camera, which is intended for the purpose of taking pictures of objects travelling at an exceedingly high rate of speed. It is perhaps not at all surprising that the maker of this machine should have decided to test it in taking a picture of an Emblem motorcycle, made by the Emblem Manufacturing Company, Angola, N. Y., which was ridden by Rudolph



Rudolph Karl of Philadelphia, Trying to Beat the Camera on an Emblem.

Karl, official demonstrator for S. A. Flamm, the Philadelphia Emblem agent. It will be seen that the camera does its work well, as the picture shows every evidence that the motorcycle was travelling at full speed.

Triumph Is Bosch-Equipped.

The Bosch Magneto Company, New York City, maker of Bosch magnetos, is authority for the statement that the Triumph Manufacturing Company, Detroit, which is to produce the new Triumph machine, has signed a contract for the Bosch as the exclusive ignition on this mount. The type of instrument which will be used is the latest enclosed model, in which the construction is such as to eliminate all possibility of moisture or dust finding its way into the operating parts of the magneto.

Cleveland the Convention Seat?

It begins to look as if Cleveland, O., would be the selection of the board of directors for the annual national assembly of the Federation of American Motorcyclists. The decision appears to rest between that city and Columbus, O., and inasmuch as the latter city had not filed its formal application previous to April 25, the chances look very promising for Cleveland.

One of the things which point toward the selection of an Ohio city is the announcement of Chicago, Indianapolis, Albany and Baltimore as the four cities from which the annual tour will start. The actual announcement of the date will be made in the near future, at which time President Hamilton will appoint the tourmasters.

Dayton's Endurance Run.

The 409-mile endurance run of the Dayton Motorcycle Club from Dayton, O., to Toledo and return last month resulted in victory for the New Era team, each member of which finished with a perfect score. Four of the individual riders, each on a Merkel, were the only ones in that list to return with 1000 points to their credit. There were five Merkel men, as shown by the accompanying illustration, and the fifth failed to make a perfect score because the pathfinding car ran out of confetti and he lost his way. His failure was in no way due to the machine he rode.

JOIN THE F. A. M.

Merkel Riders in Dayton Endurance Run: From Left to Right, Ford Sanford, Roy Toms, Vincent Steger, William Bewley and Roscoe Miller.

The official score was as follows: New Era team, Jesse A. Campbell (1000), Ivan Jacobs (1000) and Edward Rischel (1000), 3000; Yale team, S. J. Chubbuck (1000), W. McMillan (1000), and H. G. Phoul (991), 2991; Indian team, William J. Teubner (1000), Erwin G. Baker (1000) and I. G. Howitch (failed to finish), 2000. The individuals scored as follows: Roy Toms, Merkel, 1000; W. Bewley, Merkel, 1000; J. F. Sanford, Merkel, 1000; V. A. Steger, Merkel, 1000; Joe Richards, Harley-Davidson, 999; Harry Hearn, Yale, 998; Roscoe Miller, Merkel, 995. E. R. Durkee, Pierce; W. E. Stokes, Thor; J. Otto Tresemer, Indian; C. F. Weiher, Indian, and G. W. Schneider, Indian, also ran.

Club Notes, Here and There.

E. B. Ellis, F. A. M. commissioner at Berkeley, Cal., is endeavoring to have the local club become affiliated with the national body.

The Little Rock Motorcycle Club, Little Rock, Ark., is conducting a membership campaign with the idea not only of increasing its own numbers but to add to the lists of the F. A. M. as well.

The Maryland Motorcycle Club and the Touring Club of Maryland, both of Baltimore, recently held a combined run to Annapolis, 50 riders taking part.

F. Madison Barrett has been appointed official F. A. M. referee for the Augusta Motorcycle Club, Augusta, Ga., which is planning a race meet on the Georgia-Carolina fair grounds, Memorial Day.

E. Mitchel Dodson has been elected president of the National Motorcycle Club, Washington, D. C., and the organization expects 100 riders to take part in its first Sunday run to Great Falls, Md.

Plans are rapidly nearing completion for the big meeting of the Federated Motorcycle Clubs of the San Joaquin valley in California, which will be held June 1-2. It is expected that at least 1000 riders will be in attendance.

H. R. Noyes of Buffalo, N. Y., was a recent visitor to the Binghamton Motorcycle Club, Binghamton, N. Y., urging that organization to support Cleveland for the national assembly of the F. A. M.

The Terre Haute Motorcycle Club, Terre Haute, Ind., is planning for its first 1912 race meet on the half-mile dirt track in that city, May 30.

Motorcyclists in Lockport, N. Y., recently organized two teams, the "Purples" and "Golds" and by conducting a membership campaign increased in numbers from 28 to 87 in three months.

More than half of the 450 motorcycle riders in Akron, O., recently lined up for a 25-mile parade through the city.

With a membership of 500, the Chicago Motorcycle Club recently celebrated the opening of its new club house with a smoker and vaudeville entertainment.

M. Marcel Krieger, Official Tester of the Flanders Manufacturing Company, Putting the Four Horsepower Flanders to a Severe Test.

Digitized by Google

The Shortgrass Motorcycle Club, Pratt, Kan., already has signed up 172 riders for its annual district tour through four western states this summer.

The Evansville Motorcycle Club, Evansville, Ind., is considering plans for a long distance run to Indianapolis and return, a total of 408 miles.

New World's Records.

M. J. Graves, riding an Excelsior, created new world's professional records from two to 25 miles on the Los Angeles track, April 19. The same day, Donald Johns, also riding an Excelsior created new amateur marks from one to 14 miles. The previous records were held by the Indian, Jacob De Rosier holding all the professionals and Donald Johns the amateurs, with the exception of that for one mile, which was held by Ray Seymour. The new figures have been forwarded to Dr. J. P. Thornley, chairman of the F. A. M. competition committee, for official acceptance. Both the old and new records are given below:

World's Professional Records.

	Old	New

Krieger on a Flanders.

In explanation of the accompanying illustrations, it may be stated that M. Marcel Krieger, now a tester with the Flanders Manufacturing Company, Pontiac, Mich, maker of the Flanders motorcycle, was formerly an aeronaut. He was the originator of the four-by-eight scantling test for motorcycle forks, and excited no little comment when he made his first jump. The pictures show how he does it.

The company now has a number of testers who can perform this trick successfully, and there is no doubting that it offers a substantial test for the front

C. H. Frazier, Pawtucket, Taking Delivery of the First 1912 Excelsior Sold in Rhode Island.

forks as well as other parts of the construction. Krieger's record jump for height is 41 inches, and the distance traversed from the time the front wheel left the ground until it touched it again was 14 feet eight inches. To attain this record he drove his machine against an eight-inch perpendicular obstruction at a speed of over 50 miles an hour.

1912 Rule Book.

The 1912 rules for competition have been issued by the competition committee of the Federation of American Motorcyclists, and a copy may be secured by addressing Dr. J. P. Thornley, Hotel Ansonia, New York City. No club or individual who contemplates holding a motorcycle meet or taking part in one can afford to be without these official rules.

ATTENTION MOTORCYCLISTS

Immediate deliveries of 1912 Indians, any Model. Cash or installment. Full line of equipments and supplies, also clothing for the Motorcyclist.

B. A. SWENSON

298 Blackstone Street, Providence, R. I.

The F. N. Shaft-Drive Motorcycles

Single cylinder with two-speed gear and handle bar control of clutch.....$275.00

(The only machine in the world possessing this incomparable feature.)

Four cylinder ordinary automobile engine, compound spring fork, two powerful brakes, footrests if specified, combined luggage carrier and stand, long wheel base and large tires.....$350.00

AMERICAN F. N. COMPANY **Boston, Mass.**

Branches: 49 Union St., Prov., R. I. 415 Trumbull St., Hartford, Ct.

The following companies have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Felipse Tire and Rubber Company, New York City; $50,000; incorporators, Simon Schwartz, S. H. Silverman, H. A. Bloomberg.

Louisville Lozier Company, Louisville, Ky.; to deal in supplies; $20,000; incorporators, Howard Lothrop, H. T. Martin, Robert Stewart, D. T. Marantelle and Mary S. Lothrop.

Kadix Newark Motor Truck Company, East Orange, N. J.; $200,000; to manufacture motor trucks; incorporators, D. Lester Dann, G. F. Kallberg, Russell M. Colburn.

Hoopeston Automobile Company, Hoopeston, Ill.; automobiles and accessories; $25,000; incorporators, F. W. Wallace, J. H. Norris and W. N. Ferguson.

Byam International Autotire Company, Chicago, Ill.; to manufacture tires; incorporators, W. W. Byam, E. C. Byam, W. A. Scott.

Vixen Motor Company, Indianapolis, Ind.; $12,000; incorporators, F. C. Schmid, W. J. Harris, C. O. Van Horn, S. B. Lindley, D. K. Lindley.

Hercules Truck Company, Alexandria, Va.; $100,000; incorporators, S. W. Woodward, O. Ducker, E. S. Parker, B. W. Parker.

Oldsmobile Company of Buffalo, Buffalo, N. Y.; $10,000; incorporators, E. E. Holmes, T. S. Buckingham, J. C. Cannon.

United Garage Company, Boston, Mass.; $15,000; incorporators, Jesse Goode, J. R. Jones, W. F. Waters.

Todd & Courtney Company, Barberton, O.: $10,000; to deal in automobiles and accessories; incorporators, John H. Todd, Cora A. Todd, I. O. Courtney, Laura M. Courtney, C. C. Courtney.

Roby Carburetor Company, Indianapolis, Ind.; $10,000; to manufacture parts; incorporators, F. S. Roby, C. J. Schuh, E. D. Salisbury.

Elton Garage, Inc., Waterbury, Conn.; $25.000: incorporators, A. C. Judd, E. W. Judd, J. R. Hughes.

C. & R. Auto Company, Los Angeles, Cal.; $25,000; incorporators, Jay C. Cook, A. B. Cram, B. F. Robinson, George H. Cram, F. D. McClure.

Monticello Automobile Company, Norfolk, Va.; $15,000; incorporators, E. L. King, G. F. Bailey, E. J. Hickford.

Dual Wheel Company, New York City; wheels and truck parts; $300,000; incorporators, F. B. Cochran, Alexander Dow, C. W. Jewell.

C. E. Hall & Sons, Inc., Malden, Mass.; $5000; incorporators, A. N. Hunt, R. J. Cram, F. M. Sawtelle.

Lewis Garage Company, Boothbay Harbor, Me.; $10,000; incorporators, J. Edward Knight, E. T. Lewis, C. R. Lewis.

Unique Vulcanizing Company, Jersey City, N. J.; $50,000; incorporators, J. H. Hutten, J. P. Becker, U. C. Huber, E. R. Hussey.

Buick Sales Company, Utica, N. Y.; $5000; incorporators, George Beatty, A. D. Beatty, Emma L. Beatty, Patrick R. Ervin, H. S. Wilson.

Sceptre Motor Company, Brooklyn, N. Y.; $5000; incorporators, G. B. Ellis, William Y. Chandler, G. A. Wingate.

Isotta Fraschini Motors Company, New York City; to manufacture and deal in motors; $25,000; incorporators, G. M. Heckscher, G. N. Thurber, C. B. Jacque.

Federal Trucking Company, New York City; to manufacture and deal in motors; $25,000; incorporators, Donald B. Abbott, J. D. Fackenthal, J. I. Kauffman.

Blaisdell Automobile Company, Dexter, Me.; $25,000; incorporators, Charles R. Blaisdell, F. D. Blaisdell, W. H. Judkin.

U-Nit Motor Company, Wilmington, Del.; to manufacture automobiles and motors; incorporators, Edwin C. Reed and others.

Salem Oil & Grease Company, Salem, Mass.; to manufacture oil for automobile use; $25,000; incorporators, Arthur H. Rowbotham, H. T. N. Smith, W. H. Rowbotham.

New Service Station Recently Opened in Detroit by the R-C-H Corporation, the Forerunner of Others to Be Established in Several Cities.

Digitized by Google

American Pneumatic Starter Company, Alexandria, Va.; $150,000; to manufacture starters; incorporators, C. A. Douglass, G. L. Parker, A. E. Leckie.

WITH THE MANUFACTURER.

The Perfection Spring Company, Cleveland, O., has placed E. F. Lake in charge of its laboratory.

The Teel Manufacturing Company, Medford, Mass., which has been making the Teel truck and had announced a new one-ton machine to complete its line, has abandoned the latter project and is to handle the Federal truck instead.

The Mather Spring Company of Toledo, O., has appointed G. H. Brown sales manager with headquarters in Detroit. Mr. Brown was formerly with the Standard Sales Company.

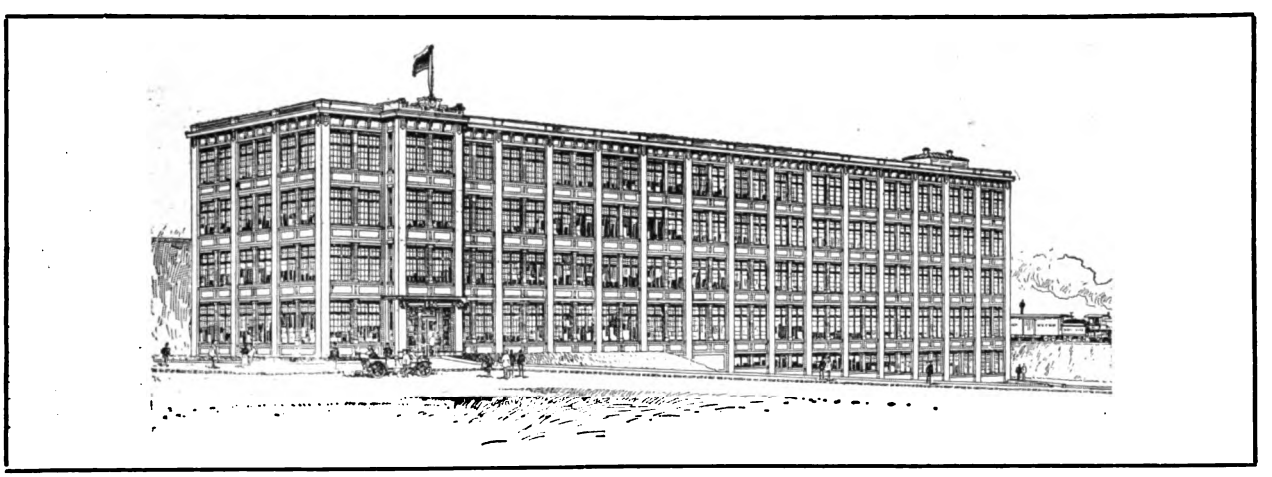
The Yates-Upholt Brass Company, Saginaw, Mich., has resumed operations after being idle for some two months. The output is to be taken by the Jackson-Church-Wilcox Company and the Marquette Company in Saginaw, both of which are subsidiaries of the General Motors Company.

The Ignition Starter Company, Detroit, has opened in that city a special service department for users of the Disco starter. George Waller has been placed in charge of the new department, which is located in the Dodge building. V. J. Jacobs, formerly with the Studebaker Corporation, has been added to the Disco sales force.

The Enterprise Auto Machine Works, Pontiac, Mich., has just taken possession of a new factory with modern equipment.

The Billings & Spencer Company, Hartford, Conn., has discontinued by mutual consent the selling arrangements with the Claire L. Barnes Company of Chicago, and will market its line of tools and forgings direct. The Billings & Spencer Company has more than doubled its capacity in the last two years and now has its new plant at Dividend, Conn., in full operation.

The Harder Auto Truck Company of Chicago has secured F. J. Posta as sales manager. He was formerly with the Kissel Motor Car Company in Chicago.



The Empire Tire Company, Trenton, N. J., maker of Empire tires, is distributing a neat little cardboard score keeper to baseball fans, enabling the runs, hits and errors to be counted.

The R-C-H Corporation of Detroit is planning to establish a chain of service stations throughout the United States and Canada, for the convenience of the numerous R-C-H dealers and users. At present the plans call for stations in the cities in which a branch is now maintained; namely, Detroit, Boston, New York, Philadelphia, Atlanta, Cleveland, Buffalo, Chicago, Kansas City, Minneapolis, Denver and Los Angeles. A complete stock of parts will be carried in each station, so that it will not be necessary to send to the factory for replacements. The first of the stations is already in operation in Detroit, and is illustrated herewith. It is elaborately equipped, 124 by 60 feet, of brick and concrete construction. Other stations are to be put into operation as soon as possible.

R. M. Owen & Co. of New York recently sent four Reo the Fifths by express from the factory in Lansing, Mich., to M. A. Young, the Detroit dealer, who had secured four orders on the condition that delivery be made within 24 hours.

Charles A. Trask has resigned as chief of the engineering department of the Cartercar Company, Pontiac, Mich., and is to make a three months' trip abroad. He will study automobile engineering practise and aeronautical work in the important European centres and will conduct investigations for several motor car concerns, as well as for the Cartercar Company.

The Randall-Faichney Company, the Mac-Kae Manufacturing Company, and the Babson-Dow Manufacturing Company are to occupy a new factory building in Jamaica Plain, Mass., on Atherton street, near Boylston station. The new building will be four stories in height, and will be thoroughly modern in every particular. It will be 60 by 250 feet, and with the basement will have a total floor space of 67,000 square feet. As shown in the accompanying illustration, the exterior will be attractive, and it may be said that the interior will be in keeping. The building will be erected and owned by the Randall-Faichney Company. Light and power will be electric, and the service is being designed by electrical engineers who will produce an ideal installation. The building is situated close to the railroad tracks, affording excellent facilities for shipping the products of the three firms, which all make automobile accessories and parts. The Randall-Faichney Company makes the well known Jericho and Jubilee horns, a line of grease and oil guns and other accessories. The Mac-Kae Manufacturing Company produces spark plugs, timers, terminals and other electrical supplies, as well as tire holders and tools. The Babson-Dow Manufacturing Company is a new concern, and will make a specialty of screw machine products in all metals. Rodger D. Babson is the general manager of this concern, coming from the Hartford Machine Screw Company. H. F. Dow will be the factory manager. He was for 15 years in charge of the screw machine department of the United Shoe Machine Company at Beverly, Mass.

Modern Concrete Factory Building to Be Erected in Jamaica Plain, Mass., and Occupied by the Randall-Faichney Company, the Mac-Kae Manufacturing Company, and the Babson-Dow Manufacturing Company.

GARAGE AND DEALER.

The Omaha Branch of the Studebaker Corporation at Omaha, Neb., is to give up the retail end of the business and devote its energies to wholesale work. The retail sales of Flanders and E-M-F cars have been taken by the E. E. Wilson Company, and both companies will occupy the same quarters as before.

The Austin Tire & Rubber Company has opened a salesroom in Salt Lake City, Utah, at 147 East First street, South.

The Buick Garage in Northampton, Mass., is being enlarged. Among the improvements is to be an electric elevator.

Digitized by Google

The Baker Bros. Motor Company, the Buffalo, N. Y., agent for the Cole, expects to be in new quarters in the near future. The new building at 1024-26 Main street will have a salesroom, storage room and service department, and is already under construction.

The Collingwood Sales Company has been organized in Toledo, O., by M. E. Humbarger and Samuel Hoover. A garage will be operated and Apperson cars will be handled in the territory including northwestern Ohio.

D. M. Beal, manager of the Moline agency in Omaha, Neb., has taken temporary quarters at 2129 Farnam street while his new garage is being built.

H. R. Pfeiffer of York, Penn., who has the agency for the Baker electric in York, Lancaster and Adams counties, has added Dauphin county to his territory and opened a garage in Harrisburg.

The Robert F. Boda Automobile Company, Columbus, O., has doubled the space of its salesroom by leasing an adjoining storeroom.

The Everitt Sales Company has succeeded the Georgia Motor Car Company at Atlanta, Ga., which handled the Everitt, Brush and National lines. The new concern is practically a factory branch, and for the present continues to occupy the Georgia company's place at 33 Auburn avenue.

W. O. Durrant, Niagara Falls, N. Y., has purchased the Prospect garage and is having it remodelled.

The True & Blanchard Company, Newport, Vt., is building a large fireproof garage on Main street and Northern avenue, with approaches from both streets.

The Boston Automobile Clearing House has been started in Cambridge, Mass., by R. I. Kendall. Second hand cars will be handled at 55 Franklin street.

The Salt Lake Automobile Company has opened new quarters in Salt Lake City, Utah, at 162 East First street, South.

Frank S. Parsons is to conduct a garage in Northampton, Mass., ground having been broken for a structure capable of housing 35 cars on the first floor.

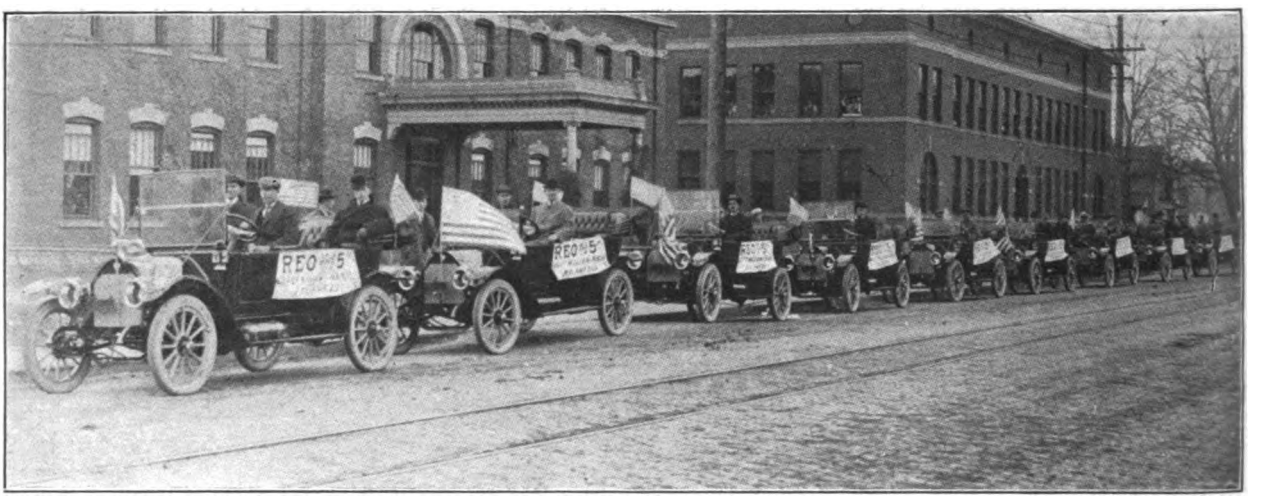
White & Durgin is to erect a large fireproof garage in Haverhill, Mass., plans having been approved.

Edward J. Gallien, Jr., has been appointed assistant to the president, and auditor of the Pierce-Arrow Motor Car Company, Buffalo, N. Y., maker of Pierce-Arrow cars.

Jesse Froelich, formerly with the Benz Auto Import Company of America, has joined the Times Square Automobile Company, New York City, and has also taken the agency for Imperial tires for New York, Connecticut, Long Island and northern New Jersey for the McGraw Tire & Rubber Company, East Palestine, O.

The Cole Motor Car Company, Indianapolis, Ind., has appointed new agents as follows: Meade McClachy, Canton, Ill.; J. C. Reeter, Lake City, Ill.; B. H. Kamp Auto Company, Mt. Carmel, Ill.; E. McMullen, Muncie, Ind.; Charlotte Auto Company, Charlotte, Ia.; Fairchild Auto Company, New Orleans, La.; F. L. Preston, Athens, O.; Norris & Cowis, Washington, D. C.; C. L. Culton, Edgertown, Wis.

A. D. Frost has been appointed manager of the New York branch of the American Locomotive Company, recently established.



The Gewinner Company, Atlanta, Ga., has moved into new quarters at the corner of Harris and Peachtree streets, occupying two floors of a new building which was recently erected.

The Patterson Automobile Company, Hamilton, Can., recently moved into a new garage at 680 King street. The establishment has storage room for 20 cars, and a complete repair department and machine shop.

The Magna Bros. Automobile Company, Holyoke, Mass., is to occupy the whole of the building in which its garage is located, at the corner of Division and Railroad streets. The second floor is to be taken over and used partly as a showroom and partly for storage.

The Gessler Williams Tire Company, Denver, Col., has taken the agency for the Swinehart tire, made by the Swinehart Tire & Rubber Company, Akron, O.

New agents for the Adams trucks, made by the Adams Bros. Company, Findlay, O., have been appointed as follows: Electric Service & Repair Company, Duluth, Minn.; Central Automobile Company, Albany, N. Y.; Hoagland-Thayer, Inc., Newark, N. J.; L. G. Schoepflin Company, Buffalo, N. Y.; Milton G. Smith Auto Company, South Bend, Ind.; Commercial Auto & Repair Company, San Antonio, Tex.; Waco Auto Company, Waco, Tex.

F. N. Milliman of Kalamazoo, Mich., Overcoming the Difficulties Attendant upon the Shortage of Freight Cars by Delivering Reo the Fifths over the Road.

Mueller Bros., Pittsburg, Penn., representative for the Alco, has taken the agency for the Haynes. J. A. Stranahan, former representative of the Haynes having joined the Muellers.

The Standard Motor Car Company, Dayton, O., has secured the agency for Lippard-Stewart trucks in Dayton and adjacent territory. The concern also handles the Hudson pleasure line.

The American Locomotive Company, New York City, has appointed new agents as follows: Highland Garage Company, Birmingham, Ala.; Advance Auto & Machine Company, Evansville, Ind; Dubuque Rambler Auto & Supply Company, Dubuque, Ia.; Lawrence M. Connell, Scranton, Penn.; Walter K. Patterson, Portsmouth, O. and N. E. Holden, Danville, Ill.

F. N. Milliman, Kalamazoo, Mich., agent for Reo cars, made by the Reo Motor Car Company, Lansing, Mich., recently overcame the difficulty attendant upon the freight car shortage by taking 12 Reo the Fifths over the road from the factory to his salesroom, the cars negotiating deep sand and mud without trouble.

The Murray O'Neill Company, New Bedford, Mass., recently opened new quarters patterned after the most approved metropolitan style. The garage is provided with supply, repair and paint rooms, while a waiting room caters to the comfort of the patrons.

MEA MAGNETO MAGNET POSITIONS.

In the article "Growth of Accessory Industries" published in the April 25 issue of The Automobile Journal, an error was made in the description of the Mea magneto, probably the best known accessory marketed by Marburg Bros., Inc., New York City, in that the cut of Fig. 4 created an entirely different impression than would have been made were it correctly described.

The illustration shown at Fig. 4 represented the relative positions of the pole shoes and the armature of the advance and retard positions of the horseshoe type of magneto. It is reproduced with the correct description, which is as follows:

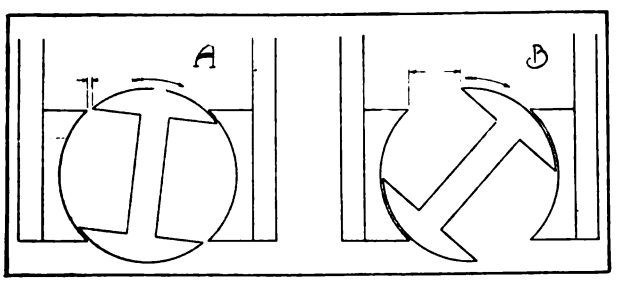

Fig. 4—Horse-Shoe Type Magneto. Relative Position of Magnets and Armature at the Moment of Sparking in Advance Position (A), and Retard Position (B).

The actual relative position of the armature and magnets of the Mea magneto do not vary no matter what the position of timing, as will be seen from the following Fig. 6:

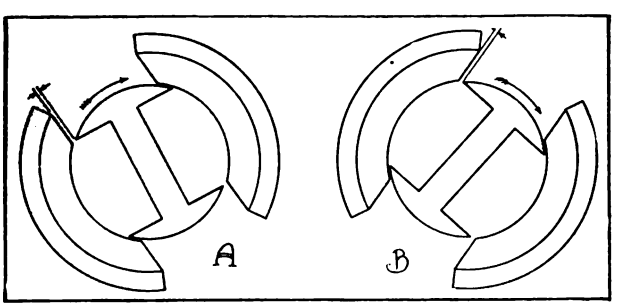

Fig. 6—Mea Magneto (Bell Shaped Magnet Type). Relative Position of Magnets and Armature at the Moment of Sparking in Advance Positions (A), and in Retard Positions (B).

This construction of the magnets of the Mea magneto is the basis of one of the claims for its superiority —that the spark is equally intense at all positions of retard and advance. It is maintained that with the horseshoe magnet type of magneto, with the magnets stationary, the relative positions of the magnet shoes and the armature must vary as the spark is advanced or retarded. With the Mea bell shaped magnet, carrying with it the timing mechanism, any movement about the armature preserves the relation and as no variation is possible the spark is always produced in the strongest part of the magnetic field. It is claimed for the Mea magneto that this construction affords greater flexibility of the motor, because the hot spark throughout the large range of timing (70 degrees) insures the ignition of the gas in the combustion chamber of the engine at both low and high speeds, and for this reason changing gears is often unnecessary.

That there shall be no erroneous impression created by the mistake in the article this explanation and these illustrations are published.

COMING EVENTS.

May.

May 12—Track events, Salt Lake City, Utah.
May 14-17—Commercial vehicle test, Chicago, Ill.
May 17-18—Track events, Denver, Col.
May 25—Road race, Barcelona, Spain.
May 30—500-mile race, Indianapolis, Ind.
May 30—Track events, Salem, N. H.

June.

June 6—Reliability run, Washington, D. C.
June 8—Track events, Narberth, Penn.
June 20—Algonquin hill climb, Chicago, Ill.
June 20-22—Reliability run, Portland, Me.
June 25-26—Grand Prix, Dieppe, France.

July.

July 3-5—Track events, Belle Fourche, S. D.
July 4—Track events, Petersburg, Ind.
July 4-5—Track events, Taylor, Tex.
July 4-6—Beach events, Old Orchard, Me.
July 5-6—Road race, Tacoma, Wash.
July 15—Reliability run, Wisconsin.

August.

Aug. 8-10—Beach races, Galveston, Tex.
Aug. 23-24—Stock car races, Elgin, Ill.

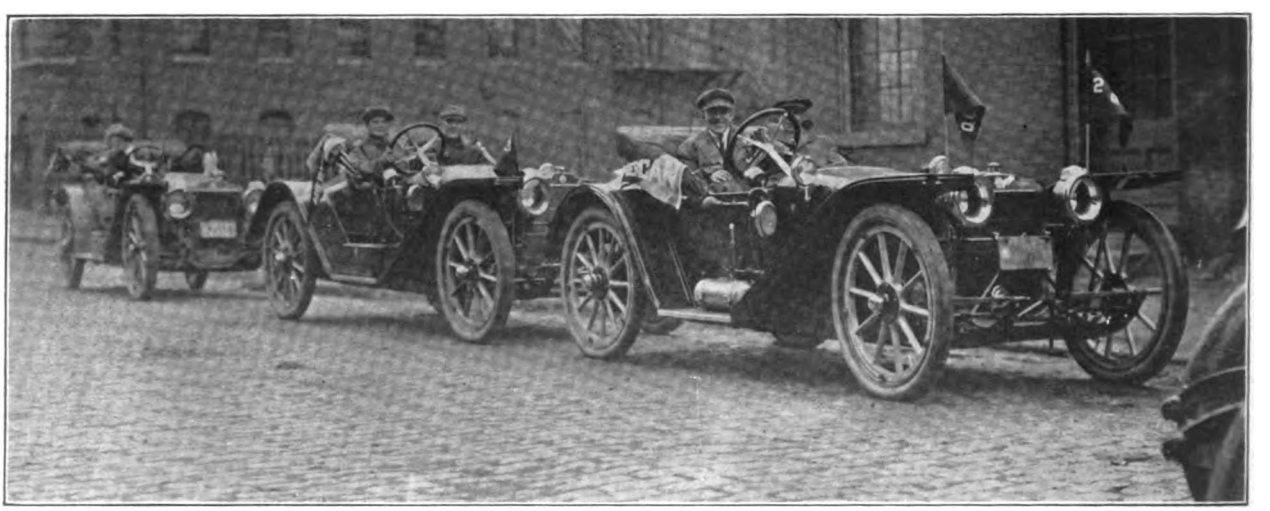
September.

Sept. 2—Speedway meet, Indianapolis, Ind.
Sept. 9—International aviation race, Chicago, Ill.

October.

Oct. 5—Fairmount Park race, Philadelphia, Penn.
Oct. 7-11—Reliability run, Chicago, Ill.
Oct. 12—Track events, Salem, N. H.

ST. LOUIS ASSOCIATION OFFICERS.



The annual election of officers of the St. Louis Automobile Manufacturers & Dealers' Association was held recently and the following officers elected: President, Frank R. Tate; vice president, W. C. Anderson; treasurer, Samuel Breadon; secretary, Robert E. Lee. Directors were elected as follows: H. B. Krenning, John H. Phillips E. P. Rhodes, O. L. Halsey, C. Gratiot Cabanne and T. L. Houseman.

NATIONAL CONTEST AND RACING NEWS.

Plans for Vanderbilt Cup and Grand Prize Races---Quaker Motor Club's Annual Sociability and Gasoline Economy Run---Reo Wins 200 Mile Event on Pacific Coast---Notes Concerning Contests in Other Sections.

Although announcement has been made that 15 conditional entries for the Vanderbilt and Grand Prize races have been received by the Milwaukee Automobile Club, it is learned that no sanction has been issued as yet by the contest board of the American Automobile Association. The club has been assured that it may have the races, in case it is able to provide the necessary police protection, etc. The contest board has asked for an additional assurance that at least three days shall elapse between the running of the Vanderbilt and the Grand Prize, and that the races shall be held sometime between Sept. 2 and Oct. 5. Thus far no official reply has been received from Milwaukee, although it is anticipated that these conditions will be met.

Three American Cars Which Took Part in Quaker Motor Club's Gasoline Economy Test.

TWO-DAY MEET IN TACOMA.

The Tacoma Automobile Club, Tacoma, Wash., is planning a two-day automobile race meet on the prairies south of the city, July 5-6. The events will be held in connection with Monta-Mara Feste, and it is expected that the programme will provide for three long distance contests, of 150, 250 and 300 miles, respectively.

NO FAIRMOUNT PARK RACE.

According to a dispatch from Philadelphia, dated May 8, the Fairmount Park Commission has refused permission to hold the fifth Fairmount Park race over the course which has been utilized heretofore by the Quaker Motor Club. As there is no other suitable course in Philadelphia, it would appear that the annual event would not be held this year.

WARREN'S NON-STOP RECORD.

The contest board of the American Automobile Association has accepted as official the non-stop record of 12,404.9 miles made by a Warren car, the product of the Warren Motor Car Company, Detroit, at Oakland, Cal., during 49 days previous to April 24. This mileage is remarkable when considered from the viewpoint of the car, but it should be added that the tires utilized were of the Fisk make, produced by the Fisk Rubber Company, Chicopee Falls, Mass. Throughout the entire distance but seven casings were used, and at the conclusion of the test six of these were utilized on an agency tour in northern California.

TEXAS FARMERS TO TOUR.

What is announced as a unique tour in the history of automobiling is to be conducted in Texas some time in the near future. The participants will be farmer motorists exclusively, and will be conducted by several of the state automobile clubs, with the sanction of the American Automobile Association. Frank P. Holland, the editor of the Farm & Ranch, a Texas

Digitized by Google

agricultural paper, has planned the tour, and a Kissel-Kar recently went out to lay out the route. It is expected that great interest will be aroused among the Texas farmers.

DISBROW'S RECORDS CONFIRMED.

The new world's records recently made by Louis Disbrow in a Simplex car on the one-mile circular dirt track at San Jose, Cal., have been accepted by the contest board of the American Automobile Association, as follows: Fifteen miles, 13:30; 20 miles, 17:54.4; 25 miles, 22:26.6.

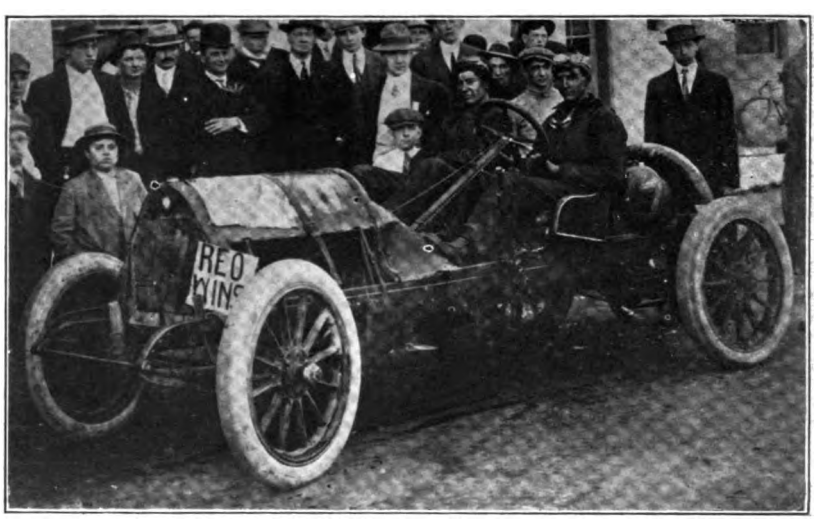
QUAKER CLUB'S RUN.

The American 13, driven by W. L. W. Jones of Coatesville, Penn., won the first prize in the gasoline economy test of the Quaker City Motor Club, Philadelphia, from the latter city to Atlantic City, N. J., April 27. Despite the heavy downpour of rain 35 cars took part in the event, nine of them being entered for the economy test and the remainder for the sociability feature. A one-ton Wilcox truck also covered the distance with the baggage of the party.

The sociability feature resolved itself into a mere averaging of the time taken by the various contestants, the driver coming nearest to this being awarded the prize. Otto C. Fell in a Packard was declared victor. C. J. Swain in a Winton second and M. E. Grigham in a Lozier was third. Mrs. D. W. Harper in a Case, the only woman to drive in the event, was awarded a special prize.

In the gasoline economy test, the winning American, equipped with a Rayfield carburetor, covered the 61.3 miles with a total consumption of two gallons and 28 ounces of fuel, which figures out at 22.07 miles to the gallon. The awards were based upon the weight of the machine, the possible points being 10. The following table shows the official result:

Car	Driver	M. P. G.	Per Cent
American,	W. L. W. Jones	22.07	9.51
Lenox,	William Fowler	13.00	6.62
Columbia,	H. O. Krause	13.38	6.53
American,	R. D. Earle	9.94	6.40
Flanders,	H. De Grout	18.55	6.26
Moon,	E. A. Edwards	11.48	5.99
Michigan,	T. De Quelta	12.33	5.70
American,	Nelson Shaw	13.33	5.12
K-R-I-T,	Albert Rich	14.71	4.98



REO WINS ON COAST.

Eight contestants took part in the so-called 200-mile road race at Fresno, Cal., April 21, under the auspices of the Fresno Republican. The distance covered really was but 197.4 miles, over a course of 14.1 miles, replete with sharp curves and bad places. Of the eight starters but three finished, as follows:

Car	Driver	Time
Reo,	Earl Jackson	3:49:00
Overland,	Thomas McKelvey	4:03:16
Elmore,	Bruce Arent	4:30:53

SPECIFIES MOTZ TIRES.

A specification of particular significance was made by Dr. Charles H. Mayo, a well known surgeon in Rochester, Minn., in ordering an Argo electric car, made by the Argo Electric Vehicle Company, Saginaw, Mich., recently. Having satisfied himself respecting the car itself, he made but one stipulation and that was that it should be equipped with Motz cushion tires, made by the Motz Tire & Rubber Company, Akron, O. These tires are designed particularly for electric machines, although they are being used with success on hundreds of gasoline vehicles. They are claimed to be as easy riding as any properly inflated pneumatic, and in addition the time saving and puncture proof features make a direct appeal to busy men, physicians and others. They are guaranteed for 10,000 miles, or approximately two years' service.

Earl Jackson at Wheel of Reo Car, Pacific Coast Winner.

DENVER-NEW YORK TOUR.

The proposed Denver-New York tour, which was projected last fall and abandoned later, has been revived by the Denver Chamber of Commerce. According to the latest information, 10 entries already have been filed and at least 20 others are expected. It is hoped to make the start, under sanction from the American Automobile Association, shortly after June 1.

NEW BOSCH MAGNETOS.

Magnetos known as types 29 and 30 of the true high-tension type and designed for slow speed stationary single-cylinder motors of compressions up to eight and 12 atmospheres have been brought out by the Bosch Magneto Company, New York City. They are constructed in two forms, one having two horizontal springs and the other one vertical. That known as the 29 type is constructed with two magnets while the 30 is fitted with three.

Current is produced by the oscillation of an armature having a primary and secondary winding between the pole shoes of permanent steel magnets by means of a tripping device operated against the trip lever by the motor. This lever is mounted upon the tapering end of the armature shaft and is held in a normal position by the tension of the springs, as outlined in

Type 29 Bosch High-Tension Magneto for Slow Speed One-Cylinder Motors, Also New Spark Plug for Heavy Duty Motors.

the accompanying illustration. When it is moved from its normal position by the operating mechanism, the springs are extended. When released it returns with the armature, this movement resulting in the production of a sparking current in the winding of the armature.

The tension of the current is augmented by closing the primary circuit at a certain position in its movement, then breaking it by means of an interrupter, at which point an arc like spark is produced at the gap of the spark plug. The movement of the armature from its natural position is 30 degrees. Magnetos of this type do not permit the variation of the ignition point, although an advance or retard of the spark may be accomplished, if desired, when the requirements of starting, or engine conditions need variation.

These instruments require the use of the new Bosch heavy duty spark plug illustrated herein and constructed especially for service with heavy gas engines. The central electrodes project slightly beyond the body of the plug, and its flat end is level with the crescent shaped end of the side electrode. The design is such that heat is conducted rapidly from the exposed portions, preventing overheating or fusing of the electrodes.

The insulator is of steatite or artificial stone, and copper gaskets are utilized, assuring a gas tight plug. The terminal connection is screwed to the central electrode and retains the rubber covered cable terminal. The plug is also designed for service on motors of high compression.

MOTORISTS MUST USE HORSES.

Motorists in Stamford, Conn., have just discovered that they must hitch horses to their machines if they wish to avoid violating an ordinance passed in 1909. Section 218 reads: "No person shall leave any cart, car, dray, truck or other vehicle in any street unless same is in use and attached to a horse or other animal."

GOOD ROADS MEETING.

The Butler County Good Roads Association held its second annual meting at Butler, Penn., recently, with 88 of the 99 road supervisors of the district and more than 300 members present. The proposed $50,000,000 bond issue for road improvement was indorsed and speeches were made by H. O. Eldridge, superintendent of road construction for the government; Dr. Donald McCaskey, and Judge James M. Galbreath. The officers for the coming year were elected as follows: President, O. W. Stoughton; vice president, A. J. Portman; secretary, J. Norman Glenn; treasurer, Edward Ohl.

GERMAN PRINCE BUYS AMERICAN CAR.

The invasion of the German automobile market by the lower priced American car seems to be causing considerable dismay among the German firms. The fact that the Crown Prince recently bought an American car is held to be the reason for a general demand for higher tariff rates. Newspapers already have published statements from the leading manufacturers calling attention to the peril and urging the necessity for this step.

The Empire Automobile Company, now operating a factory in Greenville, Penn., is to have three factories in as many cities, according to the plan announced recently. A second factory will be built in Indiana, in either Knightstown or Indianapolis, and Missouri will get the third factory, in either Kansas City or St. Joseph.

HENDERSON COMPANY ORGANIZED.

The organization of the Henderson Motor Car Company, Indianapolis, Ind., which was incorporated recently for $100,000, was completed in that city May 6. The officers are: President, L. Carter of Jessup, Ga.; vice president, R. P. Henderson; secretary and advertising director, L. S. French; treasurer, C. K. Share; directors, L. Carter, R. P. Henderson, C. P. Henderson, Chester Ricker and E. E. Rogers. The concern will produce the Henderson car.

Mr. Carter formerly was president of the Henderson Motor Sales Company and is a large stockholder in the Cole Motor Car Company. R. P. Henderson was vice president of the Henderson Motor Sales Company at one time, and before that was sales manager with the Parry Manufacturing Company. Mr. French was connected with the Henderson company as advertising manager.

Mr. Ricker becomes chief engineer of the new concern. The factory management will be in charge of Charles A. Trask, formerly with the General Motors Company. Mr. Share was at one time assistant secretary and treasurer of the Willys-Overland Company. F. E. Wilson, formerly sales manager of the Marion Sales Company, and previously identified with the sales department of the Willys-Overland Company, will be sales manager. C. P. Henderson will not be active in the new concern, devoting all of his time to the direction of sales with the Cole Motor Car Company.

USED HARRIS OILS.

Nothing can be more gratifying to the maker of any product than a generous supply of unsolicited testimonials. The A. W. Harris Oil Company, Providence, R. I., maker of Harris oils, has been the recipient of a large number of these, and some of them contain so much food for thought that the company has decided to make a neat little portfolio of them for general distribution. They cover nearly every make of car and speak highly of the superior results obtained through the use of Harris oils. The portfolio is enclosed in an artistic envelope printed in colors and is free to all who make request.

WHEEL TAX FOR CHICAGO.

Chicago motorists were much surprised recently, when it was announced that the city council had passed on March 4 an ordinance imposing a wheel tax on automobiles based on the horsepower, and revoking the old system of taxing according to seating capacity. The ordinance was kept very quiet, until April 30, the day before it was to go into effect, when it was announced, to the great astonishment of motoring organizations and others who had been keeping a watch for automobile legislation. The new ordinance places a tax of $10 on cars of less than 35 horsepower, $20 on all cars above that figure, $10 on pleasure electrics, $15 on trucks of one-ton or less, and $30 on trucks of more than one ton.

WITH OLDSMOBILE IN BOSTON.

Among the factory branch managers in Boston there is none better known than William B. Fewell, who is in charge of the New England division of the business of the Olds Motor Works, located at Massachusetts avenue and Newbury street. Mr. Fewell has been identified with the motor vehicle industry for years and is regarded as one of the "old timers" so far as length of service is concerned. He is a native of Springfield, Mass., and gained his motor knowledge with the Locomobile Company of America, being connected with that concern for a number of years. He then went to the Olds Motor Works and was located in St. Louis Mo., as manager of the branch of the company, being transferred to Boston to succeed George Houck. With the Locomobile Company Mr. Fewell was a travelling representative and as such was brought in contact with thousands engaged in the trade and industry, and as a branch manager he has become known to an exceedingly wide circle of friends. The Olds Motor Works branch will later on be housed in a fine service station now building in Commonwealth avenue, to which, when completed, the present service station at Cambridge will be moved.

William B. Fewell, Manager Boston Oldsmobile Branch.

TO ENRICH GASOLINE.

Acetrol is shortly to be placed on the market by the Acetrol Company, which was recently formed in Milwaukee, Wis., by P. C. Avery of the Avery Portable Lighting Company, maker of the Electrobola lamp. Acetrol is a chemical compound which is to enrich gasoline by producing acetylene, it is said.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

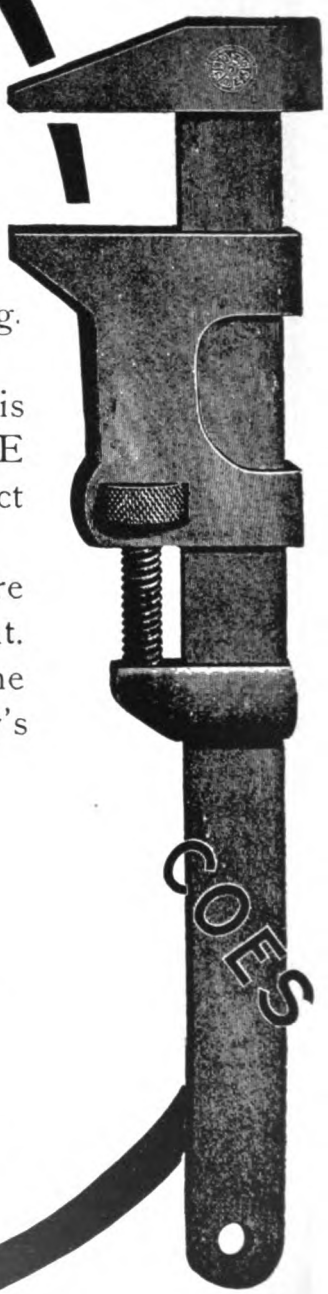
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

Something Decidedly Better For Gears and Transmission

HARRIS
TRADE MARK REG. U.S. PAT. OFF.
TRANS COMPOUND

This highly efficient lubricant is not grease nor is it a composition of harmful ingredients which masquerade under the name of lubricants.

HARRIS TRANS COMPOUND is a HEAVY OIL reduced to grease consistency. Therefore it is all lubrication. Just imagine a thick lubricating film of oil covering your gears all the time. That's what HARRIS TRANS COMPOUND does. Therefore it adds not only to the life of the gears, but it makes them mesh quickly and quietly.

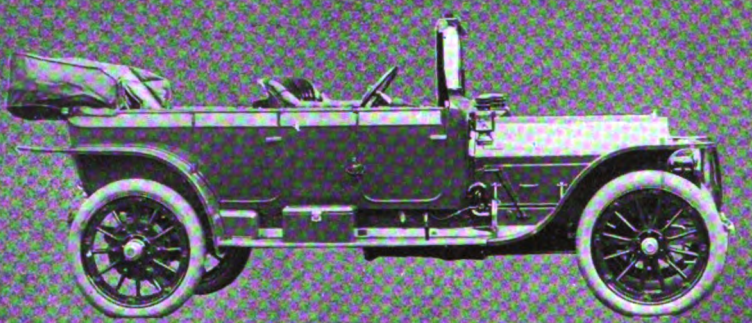
When gear movement ceases, HARRIS TRANS COMPOUND regains its normal consistency in bottom of case leaving a full, rich coated film of oil over the gears.

HARRIS
TRADE MARK- REG. U.S. PAT. OFF.
OILS

The QUALITY lubricants. Recognized as the foremost cylinder oils of the industry. Give absolute satisfaction. More mileage, better service and reduce cost for repairs.

When it comes to lubrication—HARRIS products excel everything else on the market.

Write for folder.



If your dealer does not sell HARRIS OILS, send 80 cents (for 1 gal. can) or $3.75 (for 5 gal. can) and we will ship same prepaid.

"Get-Rich-*Slow*" Wallingford

He lived in the middle ages and spent a *lifetime* making a single clock. Then only *kings* could afford time pieces, and the *best* they had couldn't compete with a Twentieth Century *dollar* watch. The clock that Robert Wallingford made lost forty minutes a day. It was like some speedometers *High price* didn't mean *efficiency*.

The *effort* that goes into *making* an article doesn't determine its *value*. If the astonishing *equipment* of the Stewart factory can make a *perfect* speedometer three times as *quickly* as others do, *you* ought to be *glad* to take the *saving*. You don't care what it costs *us*—it's what it's *worth* to *you* that *counts*. The Stewart Speedometer is worth as much as any speedometer *can* be worth. But it doesn't cost *more* than it's worth. It's a hundred per cent *efficient*. It never misses a second to the hour nor an inch to the mile. If we didn't make so many it would cost as much as any.

Magnetic principle—jewel bearings—wearing parts hardened and polished; open dial, large figures, easily read; absolutely accurate; 100,000-mile season odometer, 100-mile trip register, can be reset to any tenth of a mile. Guaranteed for five years. Strongest flexible shaft, drop forged swivel joint, noiseless gears.

"ALWAYS ON THE JOB"

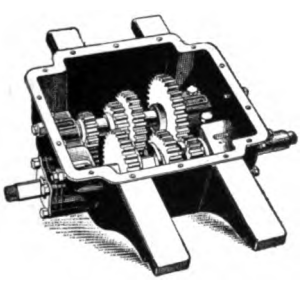
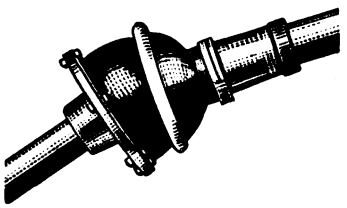
Where to Look for Loss in Power and How to Prevent it

These five parts of the motor car mechanism are the source of ninety per cent. of the friction developed.



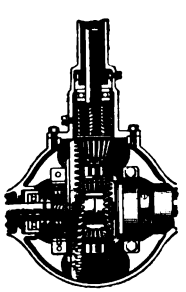
The Engine

The engine has a multiplicity of moving parts, all subject to great frictional resistance, if the oil employed is not, first and above all, high in lubricating properties. An oil which *seems* unusually good because it doesn't carbonize, may be *really* exceedingly bad, because it doesn't lubricate.



Timing Gears

Gears are greedy in devouring power. Timing gears are no exception. They need the cushioning effect of a good lubricant—one which will not thin out and will not carbonize if it should by chance work into the combustion chamber.

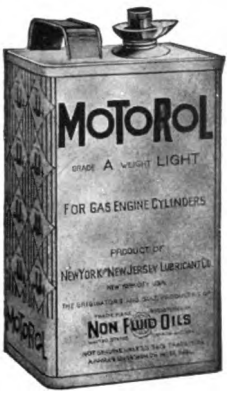


Transmission

The transmission may be the source of a ten per cent. friction loss—two horsepower out of twenty. It depends upon the lubricant you use. Stiff grease puts a tremendous overload on the driving shaft. Oil leaks out, does not cushion the teeth, and gears soon wear out. The ideal lubricant is soft in body, does not retard and does envelop and cushion the teeth.

Universal Joints

These "elbows" in the driving shaft work so hard that they destroy any kind of a low melting point grease, cause it to escape and and then they get hot from high friction. When you study the make-up of a universal joint and think of its work, you can see why a good lubricant is essential.



Differential

Here is where the driving power turns a corner and where the relative motions of the rear wheels are compensated. Such a mechanism is a hot-bed of friction when the lubricant fails. Bevel gears and ball and roller bearings must be unfailingly lubricated.

MoToRoL

will not carbonize any more than other oils which have not one third of its lubricating properties. MoToRoL is incomparable in economy.

"K-Forty" Grade Non-Fluid Oil

insures a low coefficient of friction, quiets the gears, does not thin out and will positively not carbonize under heat.

"K-00 Special" Grade Non-Fluid Oil

has that ideal consistency which some motorists try to get by mixing oil and grease. This lubricant does not melt or congeal. It is exceedingly adhesive, hence the teeth are always thoroughly coated. Gears run quietly, shift easily and do not absorb power.

"K-000" Grade Non-Fluid Oil

resists the heavy stress in universal joints and never permits sufficient friction to develop to allow wear to occur. This lubricant wears out but does not leak out.

"K-000" Grade Non-Fluid Oil.

has the necessary body to prevent metal to metal contact in the bevel gears and is perfectly adapted to the work of protecting balls and rollers and accelerating their motion. This lubricant will not escape through the housing to brake drums.

The next time you need lubricants, ask your dealer for NON-FLUID OIL and MoToRoL.

TRADE MARK REGISTERED IN NON-FLUID OIL UNITED STATES PATENT OFFICE

Overland

OUR MODEL 60 is a thirty-five horse-power, 5-passenger touring car. It is priced at $1200. Have you ever seen a car of this type for much less than $1500?

There are more Overland cars being bought today than any other similar car in the world.

This great success must be due to the fact that we are giving more car for less money than any other maker in the business. Compare our cars with anything else on the market and you will quickly realize where you can get the most in an automobile for the least amount of money. Write for a catalogue. Ask for book K45.

The Willys-Overland Company, Toledo, Ohio

Model 60-T—$1200

Wheel base, 111 inches; body, 5-passenger fore-door touring; motor, 4⅛ x 4½; horsepower, 35; Remy magneto; tires, 34 x 4 inch Q. D.; equipment, three oil lamps in black and brass finish, two gas lamps, horn and generator. Self-Starter, $20 extra.

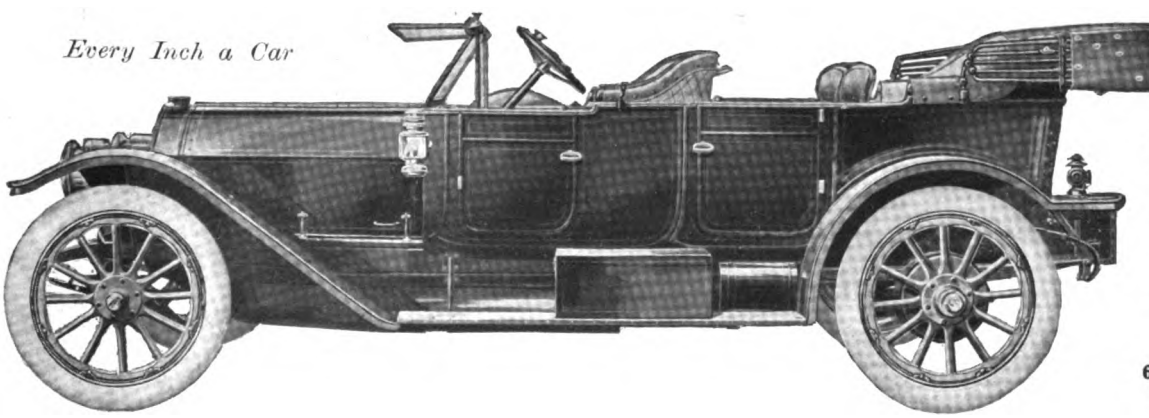
The car with maximum value in it and superior service behind it

Top Values

Extra liberal wheelbase, unusually commodious tonneaus, and a silent, masterful engine of flexible power, make the KisselKar a capable performer under severest service. Low, rangy body, with simplified lines, and wide, deep seats, give a distinguished appearance that belongs to the KisselKar almost exclusively.

Superior Service

KisselKar service is supplied through a national organization with service centers, maintained by the manufacturers, at principal points, to give owners the full service that lowers maintenance, and retards depreciation. This partial list of service centers, and especially equipped sales agencies, show the scope of KisselKar service:



Boston, New York, Philadelphia, Cleveland, Detroit, St. Louis, Dallas El Paso, San Antonio, New Orleans, Baltimore, Chicago, Milwaukee, Kansas City, Omaha, Butte, Denver, San Francisco, Los Angeles, Seattle, Portland, Minneapolis, Duluth, Buffalo, Pittsburgh, Hartford, Conn., New Haven, Albany, Troy, Montreal, Quebec, Toronto, Winnipeg, and other principal points throughout the United States.

KISSELKAR

The values of the KisselKar, model for model, are unmatched. The Kissel Motor Car Company's maintenance of service buildings at principal points, is a guarantee of the fullest motoring pleasure. This complete service, and the conspicuously superior values in the KisselKar line, bring together the two most important elements of careful car selection. Write for catalog.

Model EE—5 Passenger Touring Car—110 Inch Wheelbase

We Want the Best Dealer in 2000 More Towns!

WE'RE building 10,000 R-C-H cars this season—we shall build 30,000 for next year. We want additional dealers to handle the increased output. This year demand ran away with production, and our entire output was contracted for, with much of the best sales territory in the country unsupplied.

But we don't want merely men who will agree to sell the R-C-H cars. We don't want the one-season man, the doubtful man, the unstable man. We want dealers who will take up the R-C-H line, because, after thorough investigation, they have convinced themselves that in no other way can they give their customers so much value for the money, and for just that reason the R-C-H is the easiest car to sell.

There is hardly a post-office from the smallest cross-roads hamlet to the largest city, from which we have not received inquiries regarding the R-C-H in response to our extensive advertising. And there is no section where the R-C-H, in the hands of enthusiastic owners, is not living fully up to the advance notices. So we ask that dealers everywhere who appreciate the right car at the right price; who appreciate the utmost degree of factory co-operation; who desire a **permanent** connection; growing better and better as the years go by—write us at once.

To such dealers we have much of interest to say.

GENERAL R-C-H SPECIFICATIONS—Motor—4 cylinders, cast en bloc—3 1-4 inch bore, 5-inch stroke. Two-bearing crank shaft. Timing gears and valves enclosed. Three-point suspension. **Drive—Left-Side.** Irreversible worm gear, 16-inch wheel. **Control—Center Lever** operated through H plate, integral with universal joint housing just below. **Springs**—Front, semi-elliptic; rear, full elliptic and mounted on swivel seats. **Frame**—Pressed steel channel. **Axles**—Front, I-Beam, drop-forged; rear, semi-floating type. **Body**—English type, extra wide seats. **Wheelbase**—110 inches. Full equipment quoted above

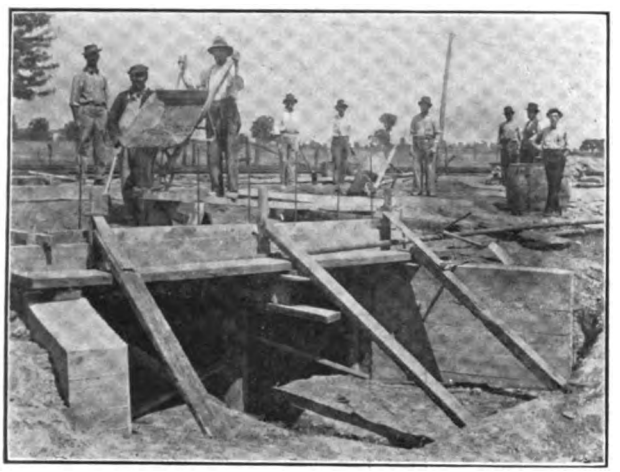
THE AUTOMOBILE JOURNAL

VOL. XXXIII, No. 8 MAY 25, 1912 Price $1.00 the Year

ADVANTAGES OF CONCRETE PAVEMENT.

Problem of Highway Construction and Maintenance of Decided Importance to Motorists--Success That Has Accompanied the Use of This Particular Method--Specific Instances Indicate Cost and Results Obtained.

SOMETHING like $4,000,000 was paid by the motorists of America in registration fees during 1911, according to the best information available, and a large proportion of this money was placed at the disposal of state highway commissions and others upon whom devolved the duty of expending it for the construction and maintenance of public roads. It follows that the owners of automobiles, commercial motor vehicles and motorcycles have a direct personal interest in the subject of highway improvement.



Mechanical Batch Mixer Which Replaces Eight or Ten Men in Work of Laying Concrete Roadbed.

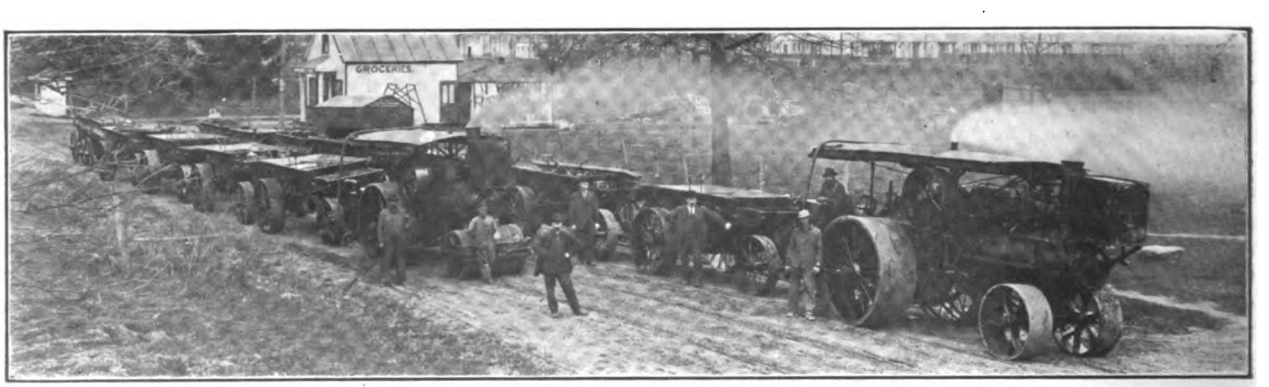
Divided according to states this $4,000,000 was contributed about as follows: New York, $883,000; Massachusetts, $460,000; Pennsylvania, $419,000; New Jersey, $375,000; Illinois, $350,000; Ohio, $255,000; Connecticut, $207,000; Iowa, $148,000; Michigan, $96,000; Texas, $78,000; Rhode Island, $73,000; Maryland, $63,000; Vermont, $60,000; Missouri, $56,000; New Hampshire, $53,000; Colorado, $47,000; California, $38,000; Virginia, $36,000; South Carolina, $35,000; Minnesota, $32,000; Oregon, $26,000; Louisiana, $24,000; North Dakota, $22,000; West Virginia, $20,000; Kentucky, $20,000; Wisconsin, $18,000; Oklahoma, $17,000; Washington, $16,000; Alabama, $14,000; Delaware, $13,000; Indiana, $12,000; Georgia, $11,000; Maine, $11,000; District of Columbia, $10,000; Wyoming, $9000; Arkansas, $8000; Nebraska, $8000; Arizona, $7000; North Carolina, $7000; Mississippi, $6000; Tennessee, $4000; South Dakota, $3000; Florida, $3000; Utah, $1000.

Some of these had no state registration in 1911,

Digitized by Google

Permanent Reinforced Concrete Culverts Make Concrete Roads of One Unbroken Surface.

the fees being collected by counties or municipalities. This practise will be continued in 1912 with some, while others have adopted new laws. In many other instances steps have been taken to increase the registration fee, the action being based upon the claim that automobiles cause undue wear upon the highways. This claim will be denied by motorists, but their denial will have insufficient weight. Other means must be taken to convince state authorities that it is possible to so build roads that they will withstand automobile, and all other vehicular traffic, and that the money expended for this purpose can be made to yield a larger return than has been true in the past.



Believing this subject to be of the utmost importance to motorists, The Automobile Journal, from time to time, has discussed various methods of road construction and maintenance with an idea of placing before the motoring public, at least, full information as to what has been accomplished along these lines, and what may be expected in the future. Engineers agree that perhaps no one type of pavement is adapted to all classes of traffic or suitable to all conditions. They will unite in the opinion that the ideal pavement is that which will be sanitary, smooth but not slippery, easy to repair and clean, noiseless, durable, and most important of all, capable of being constructed at a cost that will appeal to the taxpayers.

This last feature has a somewhat difficult bearing upon the case, since, while much of the money expended for this purpose is collected from the motorists in registration fees, the question as to its disposition rests in no small measure with the whole people. However, the growing use of automobiles among all classes, and particularly in farming communities, has led the very interests who were at one time violently opposed to expenditures for permanent ways to become equally enthusiastic with other motor car owners in demanding bettered conditions.

For the purpose of affording opportunity for comparison of costs and advantages with other types of construction which have been considered in these columns, this discussion will cite several instances where concrete pavements have been laid with excellent results. Specific information will be given as to the cost of construction and maintenance.

About 1890, wide concrete gutters were laid on the main street in Bellefontaine, O. These gutters really served as a pavement next to the curb, and after several years of exceptionally hard usage they showed so little wear and gave such general satisfaction that the city engineer decided to try this form of construction for street pavements. The streets selected for this purpose were those surrounding the court house block, two of them being quite narrow and the other two being full width. The two narrow strips were laid in the summer of 1893 and the remainder in October and November, 1894.

The pavement proper consists of a four-inch Portland cement concrete base and a two-inch wearing surface, the base being a 1:4 machine mixed gravel concrete and the top of a 1:1 mixture of Portland cement and clean, coarse sand. The materials were mixed in a screw or worm mixer 14 feet long, on either side of which was a long rectangular box for measuring the ingredients. The sand or gravel, as

Digitized by Google

Tearing Up Old Roadway with Scarifier Preparatory to Making a Proper Grade.

the case might be,, was placed in the bottom of the box, the proper amount of cement spread over it evenly, and the mass shoveled from the box into the mixer. The concrete was mixed quite dry and well tamped into place, the men laying the top following closely behind those laying the base.

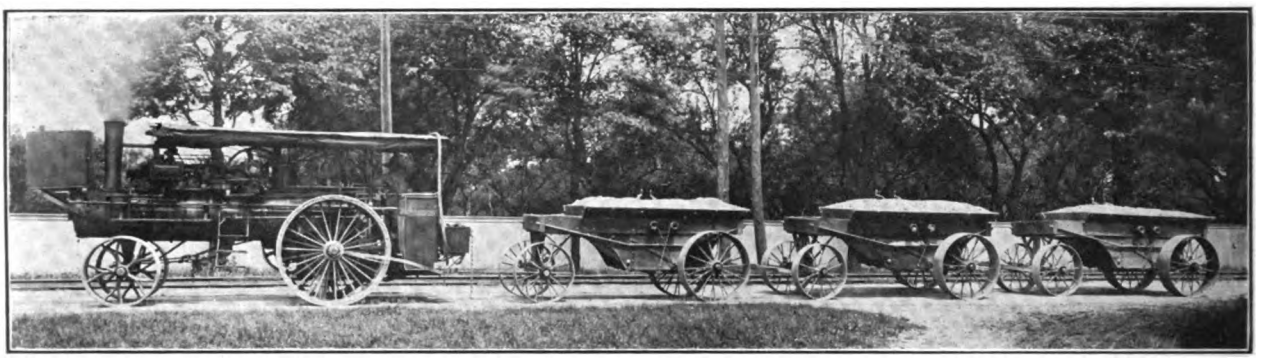
Starting at one curb, the concrete was laid in long strips five feet wide, extending the full length of the area to be paved. These strips afterward were cut into blocks five feet square. After thoroughly tamping the top it was sprinkled with water and given a smooth surface with a trowel. To afford a footing for horses, the surface on the two narrow streets was marked into blocks four inches square by V shaped grooves about .25 inch wide and .5 inch deep. On the other streets, the surface was pitted with a toothed roller. The work was done by contract and cost the city $2.25 a square yard, including drains and curb. In 1900, the population of Bellefontaine was 6550, which gives some idea of the amount of traffic to which the pavement has been subjected. After 18 years of service, the only wear discernible was along the longitudinal joints. The cost of maintenance had been practically nothing.

The next city to experiment with concrete pavements was Richmond, Ind., in which a short alley was paved in much the same manner as that at Bellefontaine, in 1896. With the exception of a slight unevenness in the surface of the blocks, due to a settlement in the foundation, practically no wear is discernible. In 1901, three additional alleys were paved with the same material, and every year since that time a small amount of concrete pavement has been laid in Richmond. The contract price has varied from $1.62 for the work done in 1896 to $1.06 in 1908.

Since 1900 a large amount of concrete pavement has been laid throughout the country, and there are at present five distinct types in use, the details of construction as compared one with another being radically different. Each will be described briefly herewith.

What might be termed single-coat work has been laid to a rather limited extent in a few places. This consists of a pavement made up for its entire thickness of the same grade of concrete, and having no specially prepared and separately laid wearing surface. The city of Panama laid over two miles of streets 13 to 20 feet wide with this type of pavement in 1906 and 1907, at a cost of about $2 a square yard as compared with $4 for brick.

This pavement was laid in alternate sections about 10 feet long to the entire or half-width of the street, depending upon circumstances. It consists of five inches of a 1:2.5:5 concrete mixed rather wet and tamped until the mortar flushed to the top and then finished with a trowel to a smooth but not slippery surface. For the coarse aggregate the old cobble stones which formerly paved the street were crushed in a portable crusher. Owing to the method of construction and the uniform tropical temperature, expansion joints were not considered necessary. The grades varied to as high as eight per cent., and the concrete surface was found to be less slippery than the brick.



What is known as the Hassam pavement has been laid during the past few years in many sections of the United States and Canada. A description of that laid in Somerville, Mass., will suffice. The cost was $1.65 a square yard as compared with $2.35 for granite block, $3.80 for asphalt, and $2.75 for vitrified brick.

The street was excavated to a depth of six inches below the grade line and rolled to the proper section. Upon this sub-grade was placed a layer of 1.25 to 2.5-inch crushed stone, which after thoroughly rolling to a surface two inches below the finished grade of the street was treated with a grout composed of one part cement and three parts fine sand. The grouting and rolling were continued until the voids in the stone were well filled. The wearing surface consisted of a two-inch layer of crushed trap rock. This was first

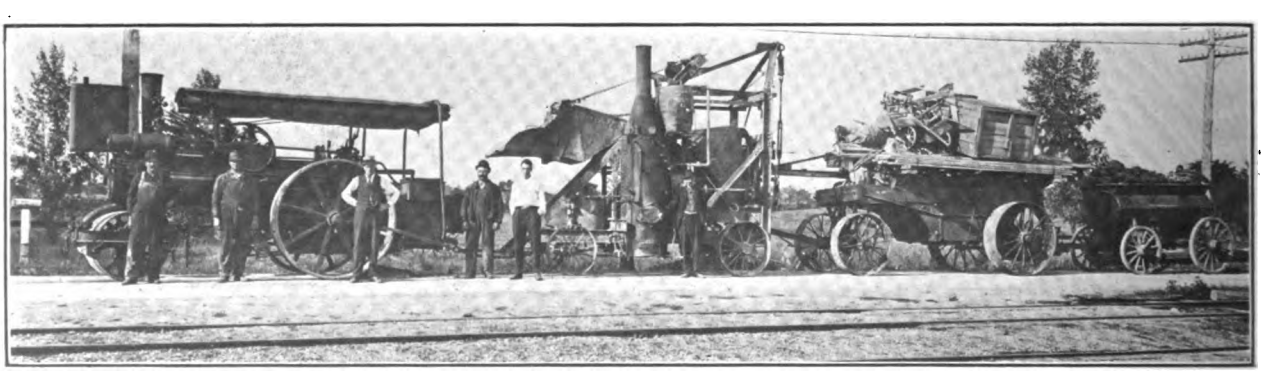
Grader Behind Steam Engine Eliminates Entirely Work with Pick and Shovel.

Digitized by Google

Hauling Materials for Road Construction, Each of the Wagons Holding Seven Tons and Replacing 3.5 Horse Teams.

rolled and then grouted with a thin grout consisting of one part cement and two parts sand. For a finish a thick grout of one part cement, one part sand and one part pea sized trap rock was poured on and brushed over the surface, allowed to harden for six days and thrown open to traffic. Expansion joints one inch wide, filled with tar were provided at the curbs and placed across the street every 10 feet.

So-called concrete cube pavement was laid near Rochester, N. Y., in 1909, some 1600 feet of 16-foot roadway being resurfaced with two-inch concrete cubes. The original surface of the macadam had worn off, leaving exposed a good lower course of broken Medina stone. The existing surface was rather rough and uneven and over this was placed a thin layer of screened gravel compacted with a 12-ton roller. On the gravel was placed the wearing surface of concrete cubes upon which a small amount of fine gravel was spread and well rolled in. Additional gravel was spread, broomed and flushed in, after which the entire surface was rolled again.



The cubes were made in a machine making 68 at one operation, and a day's work for a foreman and seven men was about 26,000 cubes. Experience showed that the concrete which contained about 2.2 barrels of cement to a cubic yard had to be mixed rather dry and that .5-inch gravel gave a product that could best be handled in the machine. The cost of the gravel-concrete cubes in place on the road was 51.2 cents a square yard. After two years' service the pavement showed no appreciable wear and no work whatever had been done upon it since it was first laid.

During the summer of 1909, the city of Ann Arbor, Mich., paved one block on a residential street with concrete having a coal tar and sand wearing surface. The following year approximately 18,000 square yards of this pavement were laid. The work was done by the city, which has its own equipment, buys the materials and hires the labor, at a cost varying from 71 to 88 cents a square yard.

Ann Arbor has a well drained, somewhat sandy sub-soil and the concrete pavement is laid directly upon the sub-grade without using a sub-base, which would be necessary were a heavy, wet, poorly drained sub-soil to be considered. The concrete consists of a 4.5-inch gravel base and a 1.5-inch wearing surface, mixed one part cement to two parts clean, coarse sand. It is laid in strips one-half the width of the street and 25 feet long, an expansion joint from .75 to one inch in width being placed every 25 feet across the street and at each curb.

The surface of this concrete is given a wood float finish and slightly roughened by brushing with an ordinary hand street broom. After finishing a section as described the form at the centre or crown of the street is removed, and the pavement for the other half of the street laid against that which had been laid previously, so that there is a joint at the crown of the street that is hardly perceptible.

After the concrete has hardened the surface is covered with hot bitumen applied with a sprinkler wagon designed for the purpose, having a fire box under the

Concrete Road Making Outfit, Owned by Wayne County Board of Supervisors, on the Way to the Next Job.

Digitized by Google

Grand River Road Before Improvement, One of the Worst Highways in Michigan.

tank to heat the material. This bitumen is distributed immediately, evenly over the surface of the concrete with an ordinary street sweeper broom, and the whole covered with sand. Approximately one-half gallon of bitumen is applied to a square yard of surface, and a cubic yard of sand will cover about 230 square yards, making the wearing surface .25 to .375 inch in thickness. For the first pavement laid ordinary coal tar was utilized, but since that time Tarvia has been substituted.

The fifth type consists of an ordinary concrete base which is covered with a specially prepared and independently laid concrete wearing surface. This is of particular interest because it not only has been given a thorough trial for city use but on country roads as well. The experience of the board of supervisors in Wayne county, Mich., in this respect is especially worthy of note. Accompanying photographs set forth this situation in a comprehensive manner.

The citations are from the fifth annual report of the board, dated Sept. 30, 1911, and cover the work accomplished since Oct. 1, 1910. To quote the supervisors: "We are pleased to report that our decision to adopt the concrete road as a standard of construction for Wayne county has been amply justified by the results. Woodward and Grand River roads, built of concrete and now in their third year, are wearing remarkably well; in fact, our concrete construction has cost practically nothing for maintenance."

This latter statement has a direct bearing on the situation inasmuch as the macadam roads which were constructed when the board began operations in this county, practically needed resurfacing during the year and at considerable expense. The whole aim of the supervisors has been to provide the people of Wayne county with a durable, permanent road at cost. In summing up the situation the report states:

"We believe that the concrete road as devised and built by us has accomplished this purpose and that it is the coming roadway. It is low in ultimate cost, pleasing to the eye, smooth, dustless, and affords excellent traction for all types of vehicles. Our concrete roads are attracting the attention of county commissioners, engineers and other public officials and private citizens throughout the country. Strict attention to detail, care in the selection of good, clean stone and sand, and the proper proportion of a standard brand of cement are requisites, however, to the accomplishment of satisfactory results."

An accompanying illustration shows the complete equipment of the board engaged in the construction and maintenance of the roads under its care. The patrol repair crew was in the field all summer, equipped with road roller, street sweeper, tar kettles and other necessary small tools, together with a camp outfit, travelling from one road to another, resurfac-

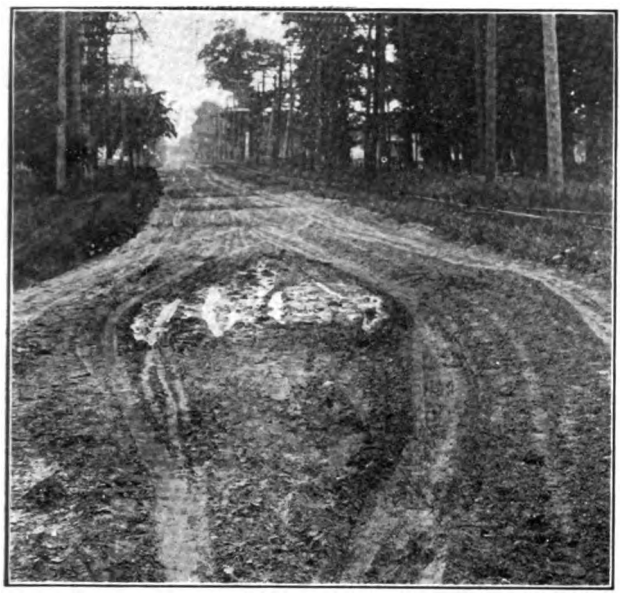
Digitized by Google

Before the Wayne County Board of Supervisors Began Operations.

ing where necessary, patching holes and ruts that had developed under traffic, shaping, filling and rolling the shoulders, cleaning out ditches, tile drains, manholes, culverts, cleaning off the accumulated dirt and refuse, painting and repairing guard rails and bridges, repairing the sides where any washing away had taken place, and maintaining the roads in a state of high efficiency generally. The macadam roads needed the principal repairs, the cost of resurfacing and maintenance totalling $14,554.11. Of this sum approximately $200 was expended on the concrete roads, and this amount was almost entirely used on the ditches and shoulders.

The method of constructing the concrete road as employed by the Wayne county board of supervisors is illustrated herewith. First, the old roadway is torn up with a scarifier or gang point plow hauled by a steam engine. Three of these machines are owned and they are considered highly efficient and economical. As soon as this work is completed the grader is put on behind the steam engine and the grade is placed in such shape that little or no work with pick and shovel is required. An outfit like that shown will do more and better work than four teams, according to the report of the board.

After the grade is prepared the material is hauled on the road, largely by the steam road engines referred to above. Each wagon shown herewith contains seven tons of material and on an average haul will make as many trips a day as a good team. This outfit, aside from the interest on the investment, depreciation and repairs, cost $9.50 a day to operate, which includes wages of engineer and fireman, as opposed to $5 a day for a team. Two tons a trip is a good load for a team over an ordinary unimproved road.



Water in sufficient quantities to meet the requirements is not often available in the country districts without some means for carrying it. Hauling by teams at $5 a day each would prove an expensive proposition, especially when it is remembered that a single crew when in operation utilizes about 15,000 gallons a day. To meet this situation pipe lines are laid to the nearly supply, these being tapped every 300 feet along the right of way, so that the water may be available at any point. A three horsepower engine is used to force it to the work. This has pumped water out of the River Rouge a distance of six miles. It would require eight teams to do the same work.

Concrete is mixed in a mechanical batch mixer which travels under its own power as shown herewith. A boom, capable of being swung at any angle, carries the mixture in a bucket and is dumped where wanted by two men, eliminating the work of eight or 10 men with wheelbarrow. Portland cement, pro-

Same Stretch of Road as Shown After Concrete Pavement Was Laid, Indicating Ideal Condition of the Surface.

Sticky Clay, Almost Impassable in the Spring and Fall.

duced by the Universal Portland Cement Company, Chicago, with offices in Minneapolis and Pittsburg, is used exclusively. The gravel is secured wherever available in sufficient quantities and of the required quality, although plans are under way for securing a county gravel pit.

Some of the pictures presented show the great improvement made under this plan. Grand River road marks the passing of the old plank toll road. Over half a century ago Wayne county attempted to solve the problem by granting 50 and 60-year franchises or charters to companies which built roads out of Detroit, and one of the first of these was the old Grand River road, laid out by Congress in 1832. The Grand River Company utilized planks and retained them until the franchise expired a few years ago. The result was one of the worse roads in the State of Michigan.

The present concrete road extends 2.51 miles and is built of a 1:1.5:3 mix of Portland cement, washed sand and washed pebbles, 16 feet of metal, 24 feet over all at its narrowest point, with a minimum thickness of seven inches. The work will be completed to the county line next year. The total cost to the date of the report is shown in tabulated form below:

Paid in 1910.

Final payment on contract	$938.75
Blue prints	2.50
Express, messenger and auto	14.27
Liability insurance	20.73
Miscellaneous	10.00
Tile	79.00
Culvert at Monnier road	807.09
	$1,872.34

Paid in 1911.

Teams	$3,223.20
Other labor	11,271.39
Pebbles, 5730 tons	8,719.85
Sand, 3619 tons	4,581.74
Cement, 7033 barrels	10,316.97
Coal, 49 tons	125.45
Expansion joints	1,160.05
Lumber and engineers' stakes	73.24
Express, messenger and auto	20.00
Water supply	325.05
Blue prints, advertising and photos	42.46
Lubrication, waste, etc	150.54
Board of men	648.11
Yard and siding	100.00
Hardware and repairs	245.15
Miscellaneous	96.71
Open ditch	196.27
Tile drains	138.46
Culverts	1,515.50
	$42,950.14
Total cost	$44,822.48

Gratoit road is one of the main trunk lines, and is constructed of concrete to the county line, a distance of 3.236 miles. It is built 16 feet wide with gravel shoulders, having a total width at its narrow-

Concrete Pavement Replaces Sticky Clay, Making a Surface Fit for All Classes of Traffic Any Day in the Year.

Digitized by Google

est point of 24 feet. The minimum thickness of the concrete is seven inches, of a 1:1.5:3 mix of Portland cement, screened sand and screened gravel. On one mile steel joints were used between the 25-foot sections, and from the results obtained it was decided to employ this type exclusively. The total cost was $43,558.49.

Fort road, one of the secondary roads, one-half mile in length, was built by contract of concrete with a 1:2:4 mix, six inches deep, in one course, with 12 feet of metal, 23 feet over all. The cost was $5296.37. Eureka road is one of the principal ways leading into Wyandotte. It is built of a 1:2:4 mix with 12 feet of metal, 23 feet over all at its narrowest point. Its length is exactly one mile and the cost $9354.92.

Wayne road south, one-half mile in length, connects the villages of Wayne and Romulus. It is built of concrete of a 2:3:6 mix, using Portland cement, washed sand and washed pebbles, 15 feet of metal, 23 feet over all. It formerly was a deep, heavy sand road. Its cost was $5056.06. Van Dyke road is also of concrete, a 1:1.5:3 mix, Portland cement, screened sand and screened pebbles, seven inches deep, 15 feet of metal, 23 feet over all. It is 1.052 miles in length and cost $15,219.76.

The longest piece of work is 7.563 miles on the Michigan avenue road, the longest trunk line in Wayne county. This road is built of the 2:3:6 mix of Portland cement, washed sand and washed pebbles, of a minimum thickness of seven inches. The width varies from 16 to 24 feet. The work included the construction of a retaining wall along the River Rouge and the building of two reinforced concrete culverts. The total cost was $130,058.88.

This last example indicates at least one point of superiority in the use of concrete for road construction. An accompanying illustration shows the Wayne county workmen engaged upon the building of a concrete culvert, and it will be noted that wood and other materials susceptible to decay or deterioration are strictly eliminated. This culvert is not only satisfactory for present but for future traffic needs, and costs nothing to maintain. Another feature of prime importance lies in the fact that there is no possibility of jolts or jars where it joins the highway. From beginning to end the 7.563 miles of concrete on the Michigan avenue road is without a break, giving what may be termed an ideal riding surface for all types of vehicles, more particularly those mechanically propelled.

For the purpose of comparison it may be stated that one mile of gravel was laid on the Plymouth road at a cost of $4516.13, as compared with $9354.92 for the mile of concrete on the Eureka road. Unfortunately there does not appear to be anything in the report indicating the cost of macadam in Wayne county. But when the cost of maintenance—$200 for 30 miles of concrete as against $14,354.11 for the macadam roads in the county—is considered, it would seem that the board was amply justified in its decision to abandon that type of construction.

The roads mentioned herein are not all of the concrete surfaces in Wayne county. They serve as examples only. It may be added that similar construction has been tried out in Washington, D. C., at an average cost of $2 a square yard; Windsor, Ont., at a cost varying from 99 cents to $1.15; Jackson, Mich., $1.70; Toronto, Can., $1.74 to $1.92; Denver, Col., $1.08 to $1.27, as compared with $3.47 for asphalt; Allentown, Penn., $1.40; Bozeman, Mont., $2.28; Gary, Ind., $1.70; Fond du Lac, Wis., $1.25 to $1.37; De Pere, Wis., $1.31; Mason City, Ia., $1.26. The experiences in each of these instances coincide with that of Wayne county, in that the cost of maintenance, covering periods extending back to 1904 and 1905, has practically been nothing. The chief signs of wear appear to be along the edges of the expansion joints.

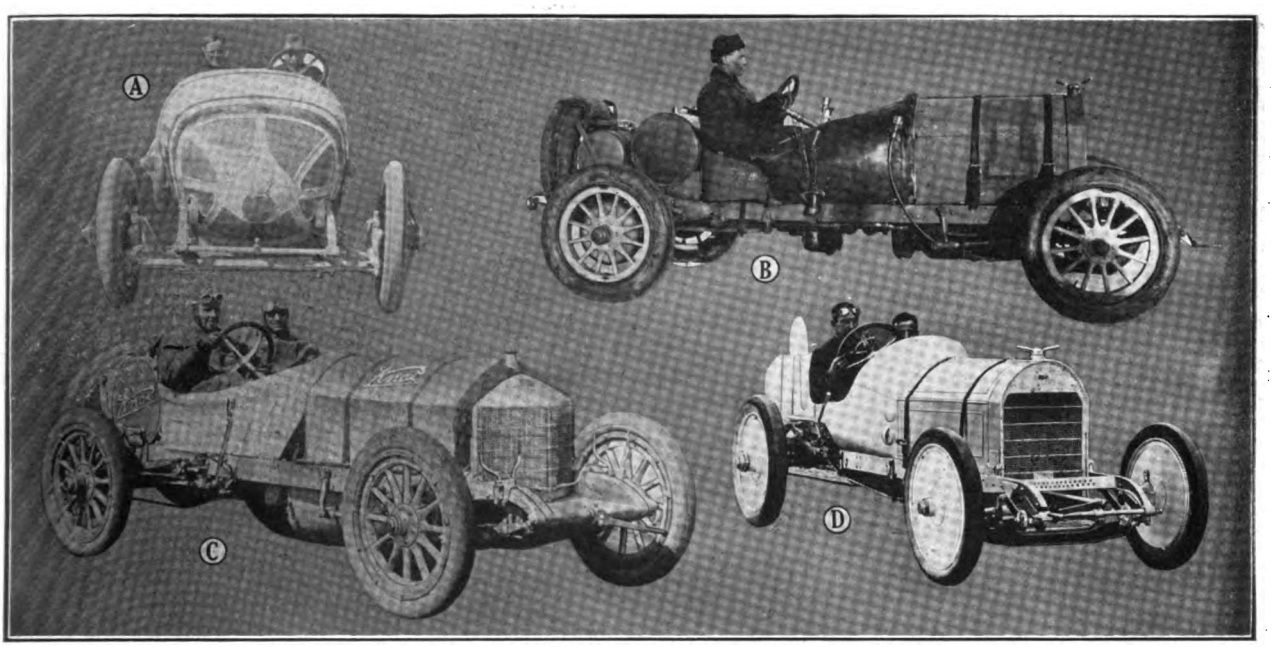
INVENTOR VISITS REMY PLANT.

The inventor of Bakelite, Dr. L. H. Baekeland, of New York, recently visited the plant of the Remy Electric Company, Anderson, Ind., in order to inspect the department for making the insulating material used in Remy magnetos. Bakelite is a chemical synthetic substance, known to the scientists as "Oxybenzylmethylenglycolanhydrid" and which may be separated for pronunciation as follows: Oxy-benzyl-methylenglycol-anhydrid. It may be made in two forms, liquid and solid. The liquid is used to impregnate armatures and coils, while distributer lids, inserts and covers are made from the solid material. The latter when first made melts at a moderate temperature, but if highly heated and then cooled it becomes infusible and insoluble, resisting temperatures of 600 degrees Fahrenheit, and above that charring without melting or burning.

TRAVELLING MOTOR CAR LIBRARY.

The latest use for the automobile is to furnish a conveyance for a travelling library, the public library of Hagerstown, Md., using an International Harvester wagon for the purpose of delivering books from door to door in the rural districts of Maryland. The car has a van body which holds nearly 1000 volumes, some in special cases to be left at the 70 sub-stations of the library, and some on shelves for the selection of the farmers along the route where the population is too scattered to maintain sub-stations. The machine is fitted with a 20 horsepower motor and is especially fitted to travel on mountain roads.

CARTERCAR CLIMBS HEAVY GRADE.



In a recent attempt at hill climbing, a Cartercar, made by the Cartercar Company, Pontiac, Mich., ascended an incline of 58.33 per cent. at Forest Grove, Ore. The incline had been built specially and was 30 feet long, with a rise of 17.5 feet.

READY FOR MEMORIAL DAY CONTEST.

Cars and Drivers in Indianapolis' Second 500-Mile Race Prepared to Exceed Previous Records---Something Concerning Machines and Equipment.

WITH the second annual Memorial Day 500-mile race on the Indianapolis motor speedway less than a week away, several changes are to be noted in the personnel of the drivers, indicating that the various entrants are seeking the best material possible. Some of these changes have occasioned no little surprise among those who have been following the racing side of motoring, and perhaps none is of more interest than the announcement that David L. Bruce-Brown, twice a winner of the American Grand Prize

Entered for Indianapolis 500-Mile Race: A, Edward Hearne, Relief Driver in Case 5; B, Howard Wilcox in National 9; C, Ralph Mulford in Knox 19; D, Robert Burman in Cutting 15.

and always a driver of foreign made cars heretofore, will be seen at the wheel of a National. John Jenkins has left the Continental machine and will pilot the White, although Winfred Barndollar took the case into the courts in an effort to retain his position at the wheel of this entry. This leaves the Continental without a driver at the present writing.

The management of the speedway has expended a large sum in an effort to remove every possible danger to contestants and spectators. A tunnel has been substituted for the old foot bridge just north of the pits. Concrete walls have replaced the old wooden partitions in the pits. An elaborate signal system has been arranged for use in case of emergency. As was the case last year, the timing device will be a Warner recording instrument, made by the Warner Instrument Company, Beloit, Wis., and in charge of C. H. Warner.

The drivers will be instructed Monday evening at 8, at a meeting of American Automobile Association officials in the Claypool hotel. They will be cautioned to be vigilant at all times. During the day the cars will begin their qualifying trials, the entry blanks stipulating that each must show a speed of 75 miles an hour over two laps of the track. The cars will be weighed in at 1:30 Tuesday afternoon. All steering knuckles, front axles, frame hangers and steering mechanism, including tierods, will be subject to the approval of Howard E. Coffin of the Hudson Motor Car Company, and the mechanical engineer of the speedway.

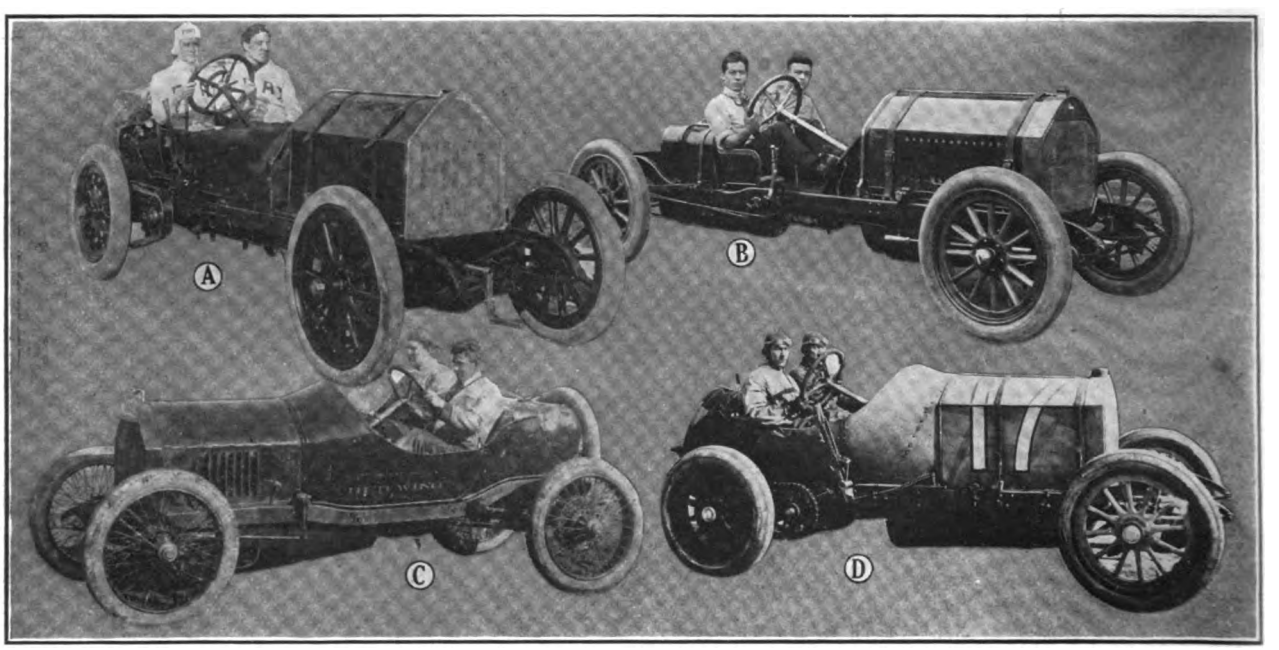
So far as it is possible to determine at this time a description of the cars and their equipment may be set forth as follows:

Stutz 1, entered by the Ideal Motor Car Company, Indianapolis, Ind., will be driven by Gilbert Anderson with William Knipper as relief. The four-cylinder motor has a bore of 4.75 inches and stroke of 5.5, giving a piston displacement of 389.9 cubic inches. Michelin tires and rims, Splitdorf magneto and Bosch plugs will be utilized in the equipment. This is the make of machine which made its first appearance in

Digitized by Google

the 500-mile race of last year, and completed the distance without a stop.

Stutz 2 is entered by the same party and will be driven by Leonard Zengel, formerly of the National racing team. Knipper has been assigned as his relief driver as well. The motor is of the same dimension as that of number one, and the equipment is also the same.



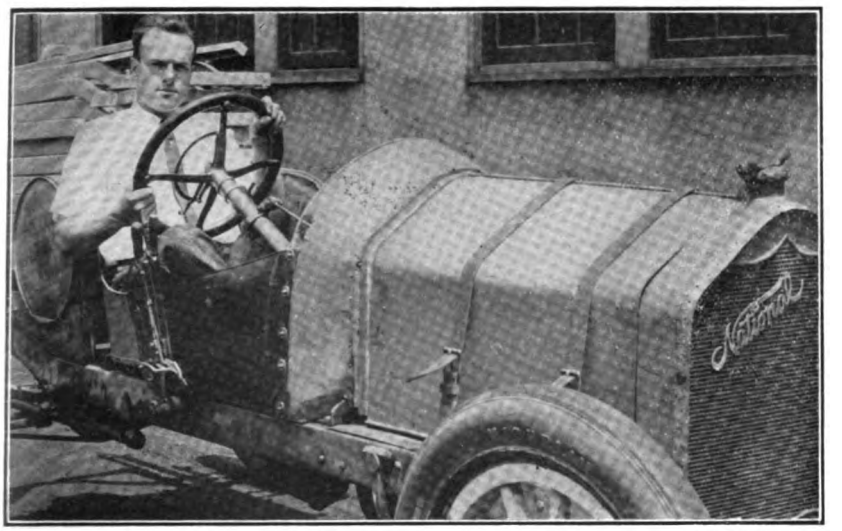
Fiat 3 is the car driven by Teddy Tetzlaff to win the Santa Monica road race of May 4, in which he created a new world's road race record of 78.5 miles an hour. Tetzlaff will be at the wheel again, with Caleb Bragg as relief. The four-cylinder motor has a bore of five inches and a stroke of 7.5, giving a piston displacement of 589 cubic inches, and being rated by the entrant, E. E. Hewlitt, at 70 horsepower. Michelin tires and rims, Bosch magneto and plugs, and Fiat carburetor will be utilized, with two sets of plugs.

Mercedes 4, entered and driven by Ralph De Palma, has a four-cylinder motor, with bore of 131.5 mm and stroke of 180 mm, giving a piston displacement of 588 cubic inches. Rupert Jeffkins will act as relief driver. Tires and rims will be of the Michelin make, magneto and plugs of the Bosch, and the carburetor, a Mercedes. Monogram oil will be employed.

Case 5, entered by the J. I. Case Threshing Machine Company, Racine, Wis., is a six-cylinder machine, with bore 4.375 inches and stroke of five, giving a piston displacement of 447.8 cubic inches. The horsepower rating of the maker is 100. Louis Disbrow will drive with Edward Hearne as relief. Wire wheels will be employed, as well as Remy magneto, two sets of Bosch plugs and Rayfield carburetor. Monogram oil will be utilized for lubrication purposes.

Case 6, also is entered by the maker, and will be driven by Harvey Herrick, formerly of the National team, and the man who created a world's road race record on the Santa Monica course with a car of that make last October. The equipment will be the same as that of Case 5.

Mercedes 7 is entered and will be driven by Spencer E. Wishart, who has named no relief driver. It is a four-cylinder car with bore of 5.12 inches and stroke of 7.09, giving a piston displacement of 583, and a horsepower rating under the S. A. E. formula of 42, although rated by the factory at from 37 to 90. Wishart has not decided whether to replace the Mercedes carburetor with a Rayfield, but probably will do so. Michelin tires and rims, Bosch magneto and two sets of Bosch plugs conclude the details of equipment available. Monogram oil will be employed for lubrication.



Additional Entrants in Memorial Day Event: A, Caleb Bragg, Relief for Fiat 3; B, Harry Knight in Lexington 16; C, Lee Frayer with Firestone-Columbus 16; D, Spencer Wishart in Mercedes 7.

National 8 is entered by the National Motor Vehicle Company, Indianapolis, Ind., and will be driven by Joseph Dawson, formerly well known as a driver of Marmon cars. His relief will be Donald Herr, who has been at the wheel of National cars in a number of events, and was at one time slated to drive one of these machines in this race. The motor has four cylinders with bore of five inches and stroke of 6.25, giving a displacement of 490.8.

National 9 will be in charge of Howard Wilcox, the only member of the well known National team of 1911 to pilot a car in this event. His relief will be Rader. The car has a larger motor than the National 8, although a four-cylinder unit, the bore being five inches and the stroke 7.5, giving a displacement

Digitized by Google

David L. Bruce-Brown at the Wheel of the National 29, His First American Machine.

of 589. In other respects it is fitted the same.

Lexington 10 is entered by the Lexington Motor Car Company, Connersville, Ind., and this will be the first time a machine of this make has been seen in a long distance race. The driver will be Harry Knight, with Johnson as relief. The motor has six cylinders, with bore of 4.125 inches and stroke of 5.25, giving a displacement of 421. Michelin tires and rims, Remy magneto, two sets of Rajah plugs, and Schebler carburetor comprise the equipment. Polarine oil will be employed.

Simplex 12 has been entered and will be driven by Bert Dingley, with Swanson as relief. The four-cylinder motor has a bore and stroke of 5.75 inches, and displacement of 597. The only detail of equipment available is the make of magneto, which will be a Bosch.

White 14 marks the return of cars of that make to long distance racing. The machine is entered by the White Indianapolis Company and will be driven by John Jenkins with Fuller as relief. It is a six-cylinder car with bore of 4.25 inches and stroke of 5.75, the displacement being 489.

Cutting 15 will be in charge of Robert Burman, who holds the world's speed record, having driven the "Blitzen Benz" over the sands at Daytona, Fla., faster than any other man. He designed the car, which is entered by the Clarke-Carter Automobile Company, Jackson, Mich., and will have no relief driver. The motor is of four cylinders, 5.218-inch bore and seven-inch stroke, and displacement of 597.9. Firestone tires, Booth rims and Remy magneto will be fitted, as well as two sets of plugs.

Firestone-Columbus 16, known as the "Red Wing," will be driven by Lee Frayer, with Rickenbacker as relief. It is entered by the Columbus Buggy Company, Columbus, O. The four-cylinder motor has bore of five inches and stroke of 5.5, giving a piston displacement of 432. Firestone tires on McCue wire wheels and rims will be utilized. The magneto will be a Connecticut, the two sets of plugs will be Bosch, the carburetor, a Schebler, and the oil, Valvoline.

Marquette-Buick 17 will be driven by William Liesaw with Farr as relief. The Buick Motor Company, Flint, Mich., maker of the car, has withdrawn from racing, and the machine is entered by Will Thomson. It has a four-cylinder motor with 4.5-inch bore, five-inch stroke and a piston displacement of 318.

Schacht 18 is entered by the Schacht Motor Car

HENDERSON

$715 ahead of its time

—more car for less money—
a popular car at a popular price

Henderson Roadster $1285

"The Car of Your Dreams"

A Real Self-Starting Car

The "Henderson" will take rank immediately with the best advertised cars—the demand is being created by running a series of attractive advertisements in all the leading newspapers—and best of all, here at last is a car that will sell *on sight* and *stay sold.* We are now open for exclusive connections with live, red-blooded dealers who desire to get a strangle-hold on the automobile sales in their territory.

At least investigate—don't decide now, but remember while you are hesitating, while you are considering the matter, some dealer in your city may apply for the exclusive sale of the "Henderson" and you will be *too late.* As a dealer you are now face to face with the biggest opportunity you will ever be offered to sell a car with which you can surely meet, beat and defeat any and all price competition.

HENDERSON

Get the "Henderson" Agency

nothing in its class—sell the Luxury equipment car the public demands

—Five Passenger $1385

Read These Specifications

The Hendersons of Indianapolis now offer you a real Self-Starting, Five Passenger Touring Car, with Luxury-equipment for $1385—116-inch Wheel Base—Ward Leonard Dynamo Electric Lighting System—34x4 tires, Demountable Rims—Long Stroke $4\frac{1}{8}$x$5\frac{1}{4}$ Silent Motor, with 3-point suspension—famous Stutz Rear Axle Transmission—silent Gears—left hand Drive—Single Lever Center Control—Gasoline Tank under cowl of dash, Gasoline Gauge on dash—Nickel mountings throughout.

Dynamo Electric Lighting System

The Hendersons of Indianapolis vouch for every claim made here—you know their high reputation in the past—and by applying for the exclusive agency of the Henderson now you will sell more cars and make more money in the next six months than you have in the last two years. The Henderson is in reply to the persistent demand for a Luxury-equipment automobile that will make driving a real pleasure—and can be sold at a reasonable popular price. Just sell one or two Hendersons to your trade and the trick is done—every one sold means an order for more.

Don't delay—don't put this matter off—it is too important. Take the first step towards building up a permanent profitable business. Wire us quick—or send this coupon by return mail.

New models of the "Henderson" will be ready for your inspection during the week of the 500-mile race at the Indianapolis Speedway, May 30.

Company, Cincinnati, O., and will be driven by William Endicott, with his brother, Harry Endicott, who has been at the wheel of cars of this make in several

Bert Dingley and His Simplex 12, as the Car Was Equipped for the Recent Santa Monica Race.

events, as a relief. The four-cylinder motor has bore of 4.75 inches and stroke of 5.5, with displacement of 389.9.

Knox 19 will be driven by Ralph Mulford, who owns and has entered the machine. It is made by the Knox Automobile Company, Springfield, Mass., and it is a source of considerable pride to this concern that Mulford should decide upon this make, after driving Lozier cars throughout his entire racing career previously. It is a six-cylinder car, with bore of 4.8 inches, stroke of 5.5 inches and displacement of 597. Michelin tires and rims, Bosch magneto, Rayfield carburetor and Oilzum oil will be employed. Mulford will have no relief driver.

Mercer 21 is entered by the Mercer Automobile Company, Trenton, N. J., and will be driven by Hugh Hughes, with Kittrell as relief. The four-cylinder motor has bore of 4.375 inches, stroke of five, and displacement of 300. Rudge-Whitworth demountable wire wheels will be employed with Michelin tires. A Bosch two-point magneto and two sets of Bosch plugs will supply ignition. Carburetion will be by the Rayfield. Monogram oil will be used as a lubricant.

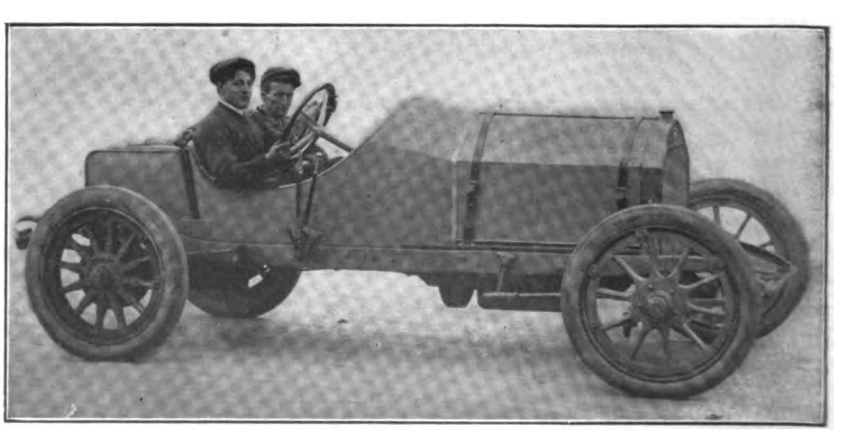
Lozier 22 is another car entered without the consent of the maker. The Lozier Motor Company, Detroit, has strongly advised against the action, but Dr. W. H. Chambers owns the machine and has seen fit to enter it, with Joseph Horan, long known as a Lozier driver, at the wheel. Ainslie will act as relief. The four-cylinder motor has bore of 5.375 inches, stroke of six, and displacement of 544.

McFarlan 23 will be driven by Melvin Marquette, with Fowler as relief. It is entered by the Speed Motors Company. The six-cylinder motor has a 4.25-inch bore, five-inch stroke and displacement of 425. Michelin tires, Baker rims, Splitdorf magneto, two sets of Red Head plugs, Schebler carburetor and Polarine oil will be employed.

Opel has been entered by Irving C. Stern and Burr B. Noble. Leonard Ormsby has been selected as driver with no relief. The four-cylinder motor has bore of 4.5 inches, stroke of 6.875 inches and displacement of 437.

Lozier 25 will be driven by Joseph Matson. The entrant is O. Applegate. The dimensions of the motor are the same as that of Lozier 22.

Shambaugh 26 is the so-called "mystery" car, inasmuch as when the entry list closed May 1, no information was available as to the make, driver, or entrant. It is a special machine built, entered and driven by Charles Shambaugh, and has a four-cylinder motor. The bore is 4.5 inches, the stroke and the displacement 318.



Continental 27 is known as the "Shark", and was to have been driven by John Jenkins. The machine is entered by F. N. Martindale, and has a four-cylinder motor. The bore is 4.25 inches; the stroke, 4.5, and the displacement, 255.

Stutz 28 is the same in every particular as the Stutz 1 and 2 and is entered by the maker. The driver will be Charles Merz, still another recruit from the National team of 1911.

National 29 has a motor the same size as that of the National 9, and will be driven by David L. Bruce-Brown.

Mason 31 is entered by the Mason Motor Company, Waterloo, Ia., and will be driven by H. J. Kilpatrick. The four-cylinder motor has a bore of 3.937 inches, stroke of five inches, and displacement of 243.5.

It will be seen that there are six six-cylinder cars and 21 with four-cylinder motors. Practically all of the machines are designed for speed, although some

Gilbert Anderson and the Stutz 1, a Combination Which Completed Last Year's Race Without Stop.

Digitized by Google

of them may be regarded as regular stock models. Last year's race was won by Ray Harroun in a Marmon, made by the Nordyke & Marmon Company, Indianapolis, Ind., his time being 6:42:08, and his average speed 74.61 miles an hour. The largest entrant this year, taking into consideration the matter of piston displacement, is Burman's Cutting 15, with 597.9, while Kilpatrick's Mason 31 is the smallest, with 243.5. It would prove a difficult matter to select a winner, however.

The prize list offered by the management totals $50,000, divided as follows: First, $20,000; second, $10,000; third, $5000; fourth, $3500; fifth, $2500; sixth, $2000; seventh, $1500; eighth, $1400; ninth, $1300; 10th, $1200; 11th, $1100; 12th, $1000. Several special prizes are offered by the makers of various accessories, among which may be noted the following:

Bosch Magneto Company, New York City, conditioned on the use of Bosch ignition—First, $500; second, $300; third, $200.

Findeisen & Kropf Manufacturing Company, Chicago, conditioned on the use of Rayfield carburetor—Special prize of $1000.

Hartford Suspension Company, Jersey City, N. J., conditioned on use of Truffault-Hartford shock absorbers—First, $250; second, $150; third, $100.

Emil Grossman Company, New York City, conditioned on the use of Red Head spark plugs—First, $1000; second, $250; third, $100.

The principal officials of the race are as follows: Honorary referee, R. P. Hooper, president of the American Automobile Association, Philadelphia; referee, A. R. Pardington, New York City; starter, F. J. Wagner, New York City; assistant starters, Ray Harroun, Indianapolis and E. J. McShane, New York; board of timers, C. H. Warner, Beloit, Wis.; O. C. Foster, Cleveland, O.; Harry Knepper, New York, and William Knight, Indianapolis; director of scorers, John A. Cox, Terre Haute, Ind.; board of judges, Will H. Brown, Indianapolis; Thomas Hay, Chicago; J. J. Cole, Indianapolis; H. O. Smith, Indianapolis; J. W. Hayden; Indianapolis; J. M. Ward, Jr., Indianapolis, and Howard Marmon, Indianapolis; clerks of course, Charles P. Root, Chicago, and C. H. Wallerich, Indianapolis; technical committee, F. E. Edwards, Chicago; chairman contest board, William Schimpf, New York; racing board representative, C. W. Sedwick, Indianapolis; chairman of press reception committee, P. P. Willis, Indianapolis.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

ROCKINGHAM PARK RACES.

The programme of races at Rockingham park, Salem, N. H., Memorial Day, will include 10 events, some of which will be open to amateurs only. However, the list of professional drivers and famous racing cars will prove of sufficient interest to attract a large crowd. Lincoln Beachey and other aviators will aid in this respect. The park is within easy reach of Boston, and it is anticipated that inasmuch as this will prove one of the most important meets in the East this year, the attendance will be in keeping.

The chief event on the programme is a three-cornered race for 50 miles, between Harry Grant, Charles Basle and Joseph Downey. Grant, who was twice a winner of the Vanderbilt cup in an Alco car, announced his intention of retiring from racing last fall. His interest in this meet has led him to retract that announcement, however, and he will be seen at the wheel of a Berkshire car, made by the Berkshire Motors Company, Cambridge, Mass.

Basle will drive a National, made by the National Motor Vehicle Company, Indianapolis, and owned by Paul Moulton of Boston. Downey is scheduled to take charge of the Jackson machine, made by the Jackson Automobile Company, Jackson, Mich., which was driven by Harry Cobe in the 500-mile race on the Indianapolis speedway, Memorial Day of last year.

Among the other entries are noted the following: Stutz, made by the Ideal Motor Car Company, Indianapolis, and entered by M. F. Chase of the Stutz agency in Boston; Chadwick, made by the Chadwick Engineering Works, Pottstown, Penn., and entered by Fred Collins of Dorchester, Mass., and Fiat, made by the Fiat Automobile Company, New York, and entered by R. R. Ross of the Boston branch of the company.

NATIONAL WINS ATLANTA CLIMB.

B. McKerrall in a National car, made by the National Motor Vehicle Company, Indianapolis, Ind., won the free-for-all in the annual hill climb of the Atlanta Automobile Club, Atlanta, Ga., May 10, covering the 4716 feet of macadam surface, well oiled, in 0:53.6. The summary of the meet follows:

Free-for-All.

Car	Driver	Time
National,	McKerrall	0:53.6
Pope-Hartford,	Crane	0:54.0
Buick,	Norman	0:55.2

301-450 Inches.

Pope-Hartford,	Crane	0:51.4
National,	McKerrall	0:54.6

Ford,	Abbott	1:04.0
Ford,	Teasley	1:11.0

Under 161 Inches.

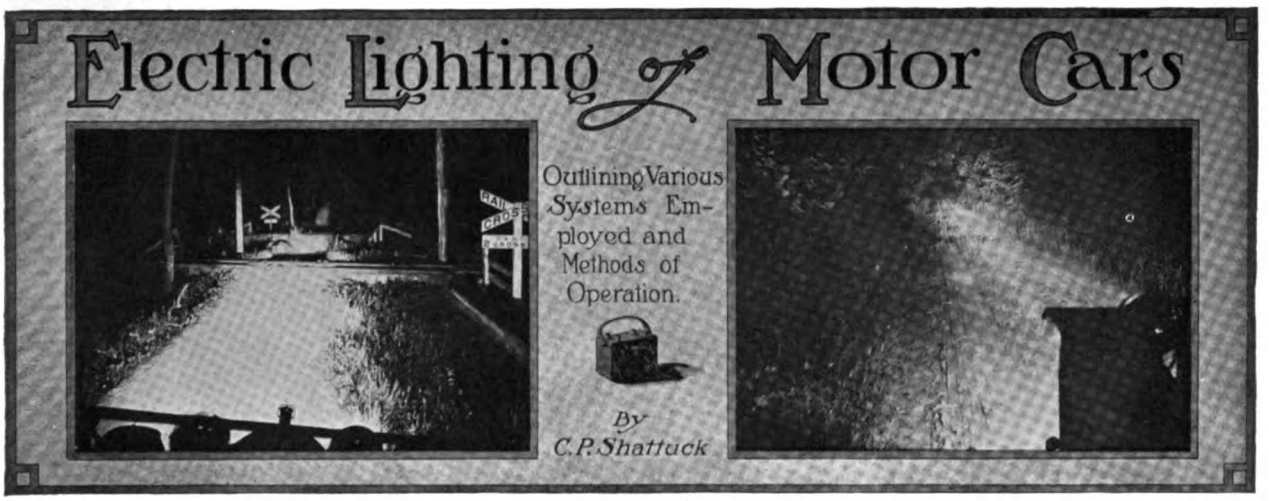
Flanders,	Lundgren	1:00.8

WARWICK AUTOMOBILE SCHOOL.

The demand for instruction in the proper care and maintenance of the automobile by owners and prospective owners has grown to such proportions as to warrant the establishment of schools devoting their attention to specialized endeavor. It is fast becoming recognized that the more one knows concerning the internal workings of the car, the less the liability of accident and the consequent saving in expense.

The Warwick School of Automobile Instruction at 1926 Broadway, between 64th and 65th streets, New York City, was established for this very purpose, and the success that has been accorded it is such as to indicate that its methods are meeting with approval on the part of owners, both men and women. Particular attention has been paid to the method of instruction, the course being divided into parts or systems, each lesson covering a distinctive portion of the car. The scheme followed is what is termed a "building-up" process, the main units being studied individually, so that, step by step, each section of the car is mastered separately until the whole assembly is complete.

The instructors are technically trained men, who have had years of experience in various automobile manufacturing institutions, and have served a number of years as instructors in some of the best known schools throughout the country. They are automobile engineers in every sense of the word, and the plan of giving specialized instruction gives each student the individual benefit of each man's experience.



The location of the school is in the heart of the automobile district. The rooms are especially well adapted for automobile instruction and are fitted up to give the student the most thorough and practical training possible. Whenever it is found that the class hours are not convenient, the student can make arrangements for special instruction. This has been found particularly beneficial to those living outside of New York City.

NEW JERSEY CLUB ELECTION.

The annual meeting of the New Jersey Automobile & Motor Club, Newark, N. J., was held recently and officers for the coming year elected as follows: President, Robertson S. Ward; vice president, David Oaks; treasurer, Herman B. Good; secretary, A. B. Le Marsena. There were chosen as a board of trustees: Ira A. Kip, Jr., Richard C. Jenkinson and George Blakslee. The report of the past year showed that the membership has dropped 113, there being now 2210 members as against 2323 the year previous. The treasurer reported a balance of $309.63. The question of a new clubhouse at Lake Apshawa, near Butler, N. J., was discussed, and the selection will be left to the vote of the entire membership.

Advocate the use of lights on all vehicles using the public ways during the hours of darkness.

Part VIII—The Delco Lighting System.

HAVING dealt with lighting equipments of the straight storage battery type and those employing a mechanical generator with the battery floated on the line or utilized as an auxiliary, the next logical step in sequence is a system providing for ignition, lighting and starting, a combination that will appeal to many motorists who maintain their own cars. Although several systems include ignition in addition to lighting, few incorporate a self-starter. The Delco equipment, manufactured by the Dayton Engineering Laboratories Company, Dayton, O., embraces all of these desirable features as a unit. Its practicability is evidenced by the fact that it was adopted by a well known maker of pleasure cars as standard equipment for 1912 models.

Motor-Generator.

The Delco device is what is termed a motor-generator; that is there are two windings in the fields, a series and a shunt. When the device is being operated as a motor for starting the engine of the automobile, the series windings are in series with the armature. When running as a generator both windings are in use, and the shunt winding excites the fields, all current generated flowing through the series winding as it is in series with the armature. The series is wound opposite to that of the shunt and the magnetism produced by the former opposes that of the latter and produces energy similar to that of a constant current system, although the maker states no special effort was made in the design to obtain this result.

Starting System.

The Delco storage battery comprises 12 two-volt cells arranged in four groups, each set aggregating six volts. These groups are connected alternately in parallel and series, which varies the voltage or amperage as required for charging or starting the engine of the motor car. The change from parallel to series is brought about automatically by a controller which when in a certain position connects four sections of the battery in parallel, providing six volts and 80 amperes. In another position the controller connects the sections in series increasing the voltage to 24 with amperage at 20, this arrangement being necessary for starting purposes. This shifting of voltage, however, does not affect the lighting system as the leads from the battery to the ignition and lighting systems are practically separate and distinct.

Although the Delco device combines the functions of a generator and motor it operates at the same speed as the automobile engine when utilized as a generator of current, and 20 times motor speed when employed for starting. Two positive type roller clutches, one on the main shaft in front of the generator, and the other in the idle gear, provides for this

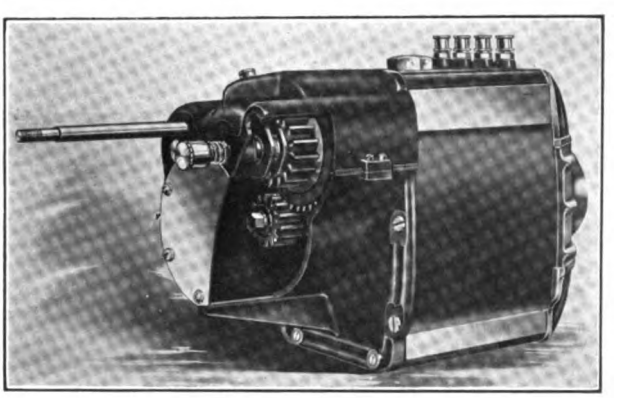

Fig. 52—Delco Motor-Generator Which Is Utilized for Starting and Lighting, as Well as for Ignition.

variable speed. The flywheel of the automobile engine is provided with gear teeth which mesh with other gears made to engage with a pinion on the motor-generator by depressing the clutch pedal of the car and by pressing a switch button. The latter operation allows current to flow from the battery through a magnetic clutch actuating the starting mechanism including the motor. As soon as the motor car engine starts under its own power the clutch pedal is released, the movement automatically discon-

Digitized by Google

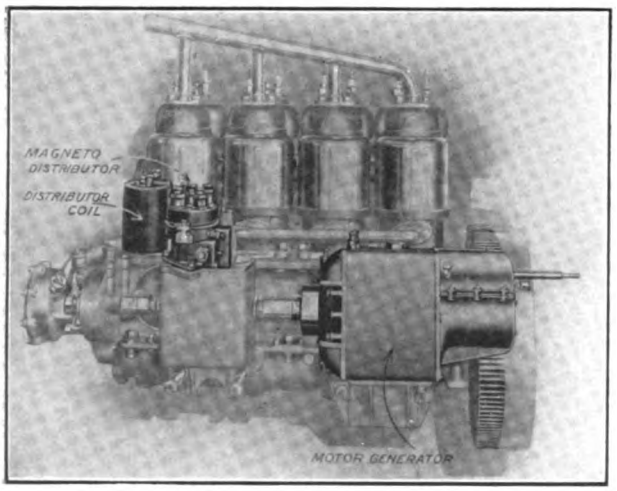

Fig. 53—Depicting Location of Delco Motor-Generator on Power Plant of an Automobile.

necting the starting apparatus, after which the clutch is utilized in the usual manner. This self-starting feature was explained fully in a recent issue of The Automobile Journal.

Ignition System.

With the Delco ignition system, as is depicted at Fig. 53, which also shows the location of the motor-generator and its relation to the flywheel of the internal combustion engine, it is claimed that the same quality of spark is obtained as with a magneto. The high-tension current is distributed to the proper plugs by a brush device actuated by a cam, the principle being similar to that of the usual magneto. Another brush is incorporated, its function being to ground the cylinder next in firing order, to prevent premature ignition of the mixture in that member, which might be caused by induction between the high-tension wires carried in metal tubes.

When the automobile engine is operating at a speed of less than 300 revolutions a minute, current is furnished for ignition by the storage battery, but above this speed energy is supplied by the generator. In either case, the low-tension current is converted into high by a distributor coil, whence it flows to the centre terminal of the distributor proper, being diverted to the correct cylinder by the brush and cam device. It is stated by the maker that the shifting from storage battery to generator is automatic and positive, requiring no attention whatsoever.

Lighting System.

The Delco motor-generator, which is shown at Fig. 52, weighs about 65 pounds and the maker holds that this weight is necessary to produce a quiet running machine at engine speed. The armature shaft is one inch in diameter, assuring alignment under the severest operating conditions, a size which also permits of carrying the armature close to the pole pieces, the space being .015 inch, and an arrangement making for efficiency in the generation of current. Large sized, high grade ball bearings support the armature shaft, the commutator of which is fitted with 72 copper segments separated by a special mica, making for durability and efficiency. The brushes which collect the current, are made of a very low resistance carbon and contain their own lubricant. It is claimed by the maker that being mounted on arms instead of the box type holder that they will operate successfully with only a wear of .0625 inch for each 10,000 miles, requiring no attention, as well as being free from arcing or sticking.

Utilization of Current.

Current for starting, ignition and lighting is supplied by the storage battery when the power plant is idle as well as when operating below 300 revolutions a minute. Above this the battery assists the generator when required. It is pointed out that the ignition system operates at maximum efficiency at one ampere which is supplied at 300 revolutions a minute of the generator and that with the headlights and tail lamp seven amperes are consumed, which amount is furnished when the motor of the automobile is turning at 410 revolutions a minute.

The Delco generator was designed to produce current at low speeds and consequently has a large output at higher ratios of the motor. It supplies the system when developing six volts or slightly in excess of this amount, and furnishes about 10 amperes to the battery when operating at 750 revolutions a minute.

Cut-Out Relay.

As with all systems utilizing a mechanical generator of electricity for charging a battery, a control of

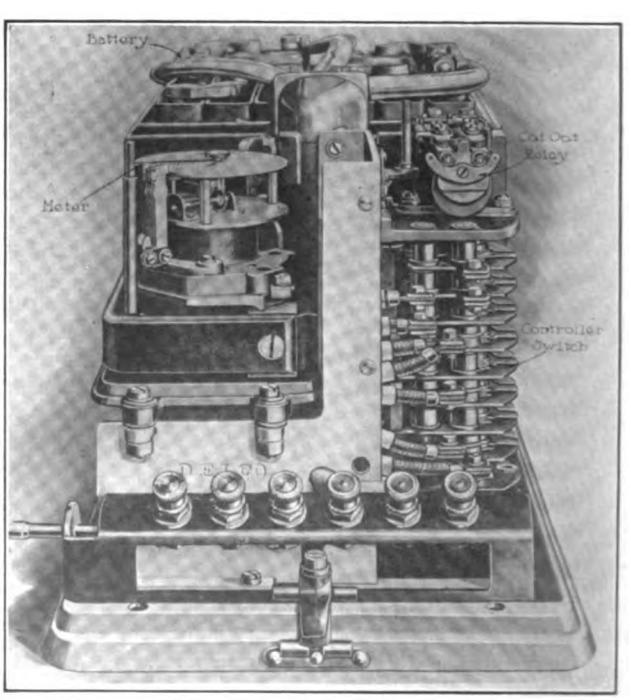

Fig. 54—Delco Battery Box Assembly, Showing Ampere-Hour Meter, Controller Switch for Changing Voltage, Cut-Out Relay and Storage Battery in the Rear.

Digitized by Google

the current is essential. That is, when the strength of the current of the battery is in excess of that being generated by the motor it will flow back to the generator unless means are incorporated to prevent this discharging of the battery. The Delco system makes use of a cut-out relay, which is depicted at Fig. 54, a device similar to those employed in telephone and telegraph exchanges. When the generator develops a current in excess of that of the battery the relay closes, permitting the electricity to flow to the container, and opens, breaking the circuit, when the voltage of the battery exceeds that developed by the generator. The relay is simple, operates automatically and requires no attention whatsoever.

The principle may be understood readily by a study of the diagrams outlined at Fig. 56 which present an analogy between a reservoir of water supplied by a power pump and the Delco system. That at A depicts the reservoir equipped with a float regulator utilized to indicate the amount of fluid, also to shut off the power pump when a predetermined level is reached.

In the main line, between the pump and the tank is located a check valve which prevents the water from flowing out through the pump when the pressure of the fluid in the container exceeds that of the pump or when the latter is inactive. If one of the outlets be opened and water allowed to flow, the level of the fluid in the reservoir will fall, until a certain point is reached when the float will fall, causing the closing of the switch and consequent operation of pump and renewal of supply.

If all outlets be opened and the water utilized equal to that supplied by the pump, the level will remain constant, but when the quantity drawn off is in excess of that supplied by the pump, the deficiency will be taken care of by the reservoir until its supply is exhausted. If a rheostat were placed in the circuit and adapted to regulate the speed of the pump with relation to the quantity of water being drawn from the reservoir, the level practically would be maintained.

The Delco system at B is similar in its operation to that of the water system, the pump being analogous to the generator, the check valve to the cut-out relay, the reservoir to the storage battery, and the outlets to the leads from the battery to lamps, ignition, etc. With the electric system it is essential to supply the battery properly but not overcharge it, a condition which might easily exist if the automobile were utilized largely during the day and but very little at night.

It is pointed out by the maker that to fully charge a storage battery of normal six-volt rating, the voltage must rise to 7.5, and if the battery should become discharged or the plates sulphated, it is necessary to raise the voltage beyond this point to obtain a proper charge. It is obvious, therefore, that to charge a battery properly the flow of electricity should be regulated, or the amount supplied measured. This is obtained in the Delco system by a specially designed ampere-hour meter which is connected in the main circuit of the generator and which is depicted at Fig. 54. The device is so regulated that it measures an amount of current slightly in excess of the actual capacity of

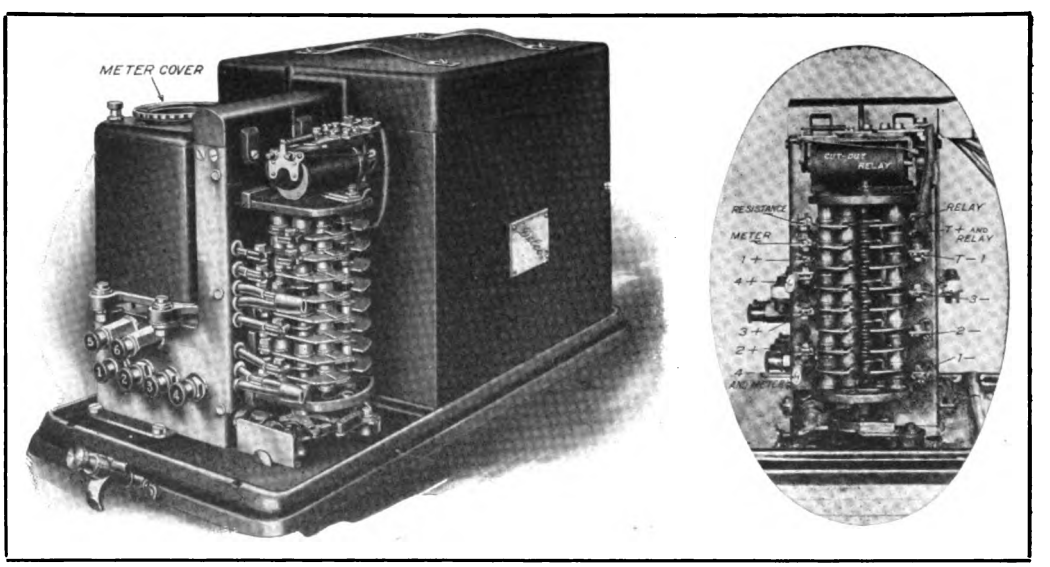

Fig. 55—Outlining Compact Arrangement and Accessibility of Delco System.

the battery, shuts off the flow of current, or reduces the charging rate as the conditions require.

Operation of Ampere-Hour Meter.

The electricity flowing into the battery causes an arm of the device to approach a point at which, when the battery is fully charged, resistance is introduced into the circuit, finally cutting it out entirely. Current flowing out of the battery causes the hand to move away from the stated point and a distance in proportion to the amount of energy utilized.

This hand or indicator denotes the number of ampere-hours in the battery, as well as those consumed, and moving over a calibrated dial, readily accessible, it is an easy matter for the operator of the motor car to note the condition of the battery at all times. The device is adjustable; that is, provision is made for automatically giving the battery a slight overcharge. This is accomplished easily by setting the hand back

Digitized by Google

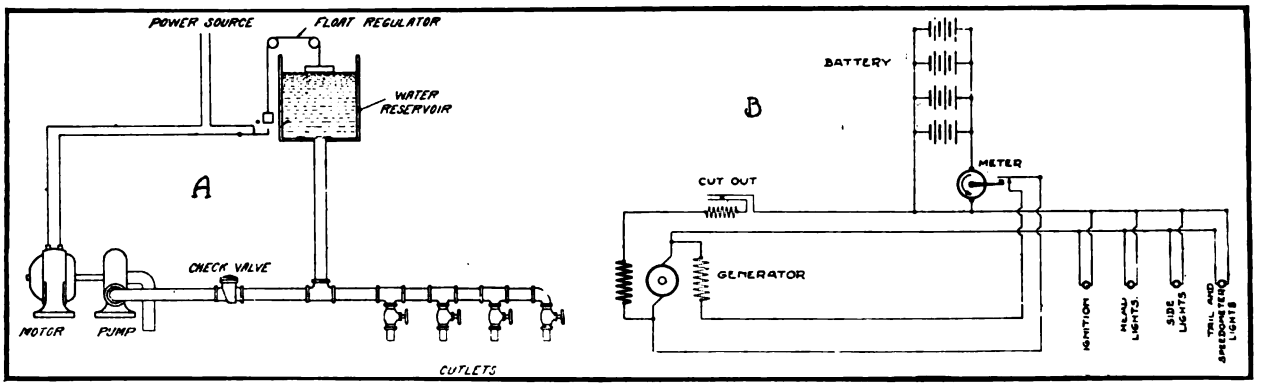

Fig. 56—Theory of the Delco System, Illustrated by an Analogy of Power Driven Water Pump, Depicted at A, and Electric System at B.

to a "70" mark once in two weeks. This with the addition of a little distilled water in the cells, constitutes the sum total of attention required of the Delco system.

Storage Battery.

The storage battery utilized in connection with this system was designed especially for the company, and consists of 12 cells in groups of three, these being numbered 1, 2, 3, 4, respectively. The leads also are marked making for easy identification when replacing the battery. The connections to the meter, cut-out relay and controller are easily distinguished, as will be noted at Fig. 55, and it is claimed by the maker that by a little study of the contents of the instruction book, anyone can properly wire the system.

Lamps.

The voltage is 6.5 and the lamps are constructed accordingly, being of the reverse spiral design, a form which the company maintains is very efficient because the lamp may be focussed for extreme penetration and at the same time provide maximum side rays. The tungsten filament is mounted by a special process, one that reduces loss by breakage to a minimum. The output of the system is such that a group of lamps consisting of two head, two side, a tail and a speedometer, as well as an electric horn, are supplied with a steady current at all times. As with other lighting systems, provision is made for utilizing any group of lamps desired. The battery alone, when fully charged, will maintain the entire group from 10 to 12 hours, and side, tail and speedometer members for about 36 hours.

By referring again to Fig. 55 it will be noted that the battery, controller and ampere-hour meter are compactly arranged, and being fitted with substantial covers, preclude moisture and foreign elements. The unit may be located on the running board or any convenient place and it is held by the maker that the weight of the entire system is but slightly in excess of the usual gas tank and auxiliary ignition batteries. The workmanship and material throughout are of the highest quality, making for durability and efficiency under all operating conditions.

(To Be Continued.)

ORIGINAL KNIGHT MOTOR.

The original silent Knight motor, built in Chicago in 1907 by Knight & Kilbourne, is to be placed in a car and used for touring by L. B. Kilbourne, in order to ascertain just how long it will stand up. It already has run 150,000 miles in this country and on the testing tracks of the prominent automobile factories of Europe, being used by the inventor, Charles Y. Knight, when he was trying to interest the automobile manufacturers in his invention.

BLANCHE BATES IN DETROIT ELECTRIC.

Perhaps no one class of people has grown to depend more largely upon the automobile for recreation purposes than those whose working hours are devoted to furnishing amusement for others on the stage. Numerous actors and actresses have purchased cars with which to occupy their attention when not at work, and not a few of these have elected to utilize their machines in travelling from city to city, thus avoiding the unpleasantness attendant upon frequent use of the railroad.

One of the most recent accessions to the list of automobile owners among well known stage people is Miss Blanche Bates, who has selected a Detroit shaft driven electric coupe, made by the Anderson Electric Car Company, Detroit. As will be noted from the accompanying illustration, a reproduction from a snapshot photograph of Miss Bates in Golden Gate park, San Francisco, Cal., soon after taking delivery of her car, it will be noted that the appointments are most complete in every respect.

Miss Blanche Bates in Detroit Electric Coupe at Golden Gate Park, San Francisco.

Miss Bates declares that her decision in favor of an electric was due to the fact that she wanted to be perfectly certain that she would not be dependent upon a mechanic for any care which the machine might need. Her use of the car has been such as to indicate that she made no mistake in this particular, since she has found that it meets her every requirement and that she has not been compelled to call upon anyone for assistance of any nature.

STRAW BALLOT FOR IMPROVEMENTS.

The King Motor Car Company, Detroit, recently conducted a straw ballot on the shortcomings of the motor car, asking a list of owners all over the country to point out possible improvements. As might have been suspected, left side steering with centre control had a large number of advocates, and the long stroke motor came in for a goodly number of votes. About the only unusual feature of the ballot was the complaint concerning the springs, which many said were hard riding, needing effective shock absorbers. Many seemed to think that there was room for improvement in the springs and their suspension, and that they should be so designed that shock absorbers would not be necessary.

SALES MANAGERS' CONVENTION.

The Automobile Board of Trade is working out the details of the convention of sales managers which is to be held in the near future. The dates have not been decided upon definitely, but the idea is to hold the meeting when it will be most convenient to all, and will probably take place late in June or early in July. Papers are to be presented upon subjects peculiar to the sales department of the automobile manufacturers. The committee of arrangements is composed of the following: H. O. Smith, Premier; E. R. Benson, Cadillac; W. E. Metzger, Everitt; C. W. Churchill, Winton; W. T. White, White.

COLE TO MAKE MEDIUM PRICED CAR.

From Indianapolis comes the announcement that the Cole Motor Car Company, of that city, is to shortly launch a new medium priced car for the 1913 season. The car, it is stated, will embrace all the well known Cole qualities, but will be smaller in details such as cylinder dimensions and wheelbase. The Cole Junior, as it will be called, is to sell for a medium price and will be made in one wing of the new Cole factory which was recently built, the regular 40 horsepower car being manufactured in the other wing.

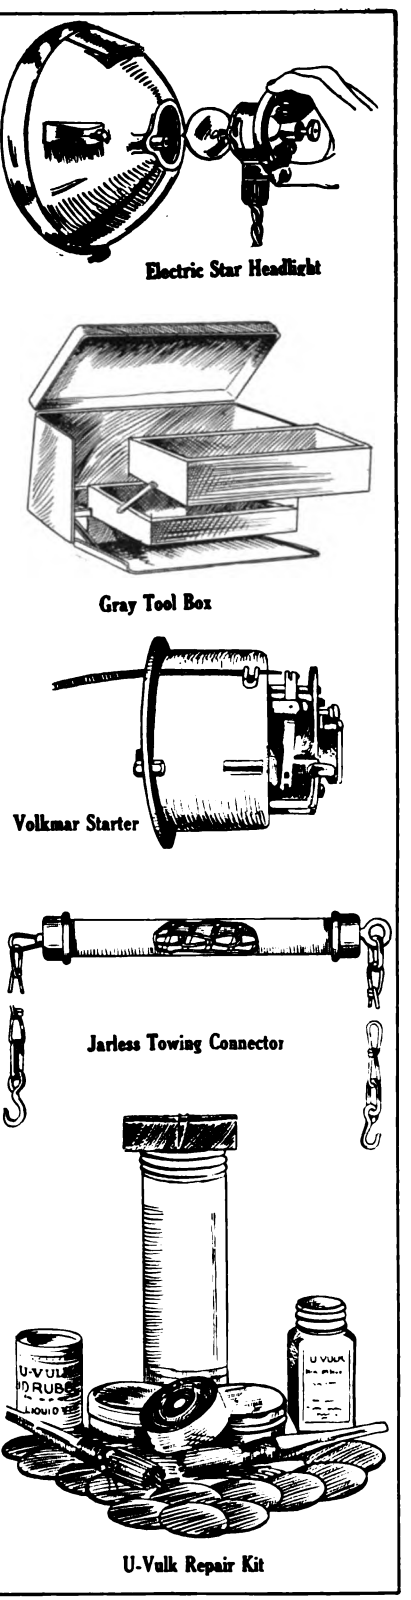
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.



Electric Star Headlights are made by the Milwaukee Bronze Casting Company, 119 Clinton street, Milwaukee, Wis., and are designed to throw a powerful white light straight ahead and at the same time diffuse a less brilliant illumination to the side, lighting up the curves and passing vehicles so as to reduce the risk of collisions. This double ray effect is secured by the design of the reflectors, which are of modified parabolic form. The lamp is cast of non-corrosive silver aluminum about .1875 inch thick, without any rivets to jar loose or solder to crack because of the vibration to which automobile lamps are subjected. The interior is brought to a high polish which is unaffected by the weather or gases, due to the composition of the metal. The lamp is equipped with Ediswan bayonet lock base, which will not allow the bulb to become loose. A feature of the member is a focussing device which enables the bulb to be focussed in a position which will give the illumination desired. This is controlled by means of a screw and lock nut on the outside of the hub which carries the bulb.

★

The Gray Tool Box is constructed with the trays on movable arms so that they may be pulled out and held in such position that all the contents are in view at once, an obvious convenience in searching for tools. The front is hinged and may be used as a shelf with the box bolted on the running board. The device is provided with a brass trunk lock and is made by the Gray Specialty Company, 148 Avon avenue, Newark, N. J.

★

The Volkmar Starter is made by the Volkmar Auto Starter Company, 203 Broadway, New York City, and is of the spring type, the motor being turned over by means of two steel springs. It is simple in construction there being but 28 parts, all exposed to view by removing the brass cover, as shown in the illustration. The starter is attached in place of the starting crank and needs no alteration of the car before it can be installed. It is eight inches in diameter and seven inches long, and is operated by a pedal connected to which is a flexible cable. Depressing the pedal releases the springs, which turn over the motor. When the motor starts, it rewinds the springs to the original tension, when they are disconnected from the crankshaft and held tightly until the next time it is desired to start the car. Two types of the starter are made, A for cars with motors of up to 30 horsepower, and B for cars of up to 60 horsepower, weighing 35 and 45 pounds, respectively.

★

The Jarless Towing Connector will be appreciated by those who have towed a car or have been towed, and have experienced the jars and jolts to which the machines are subjected in starting. A heavy spring takes up and absorbs the jerk, acting as a shock absorber and turning the quick pull into a slower and easier one. It takes up a space of four by 14 inches in the tool box, so that it is convenient to carry. It is made by the Jarless Auto Towing Device Company, Cleveland, O.

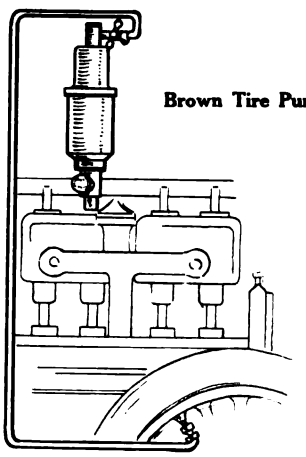
★

U-Vulk is a vulcanizing outfit which is complete in itself, containing patches, brushes, rubber in strips and in solution, and a liquid vulcanizing agent which chemically vulcanizes the raw rubber to the tire or tube. It renders tire repairs possible without heat, and comes in a compact form, fitting in a pasteboard screw top carton. It is made by the Gem City Liquid Vulcanizer Company, Dayton, O.

★

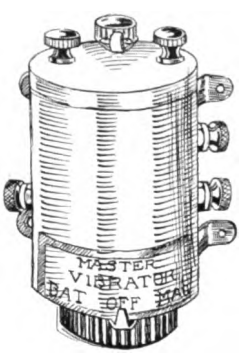
The Brown Impulse Tire Pump is made by the Brown Company, Syracuse, N. Y., and is a power

Digitized by Google



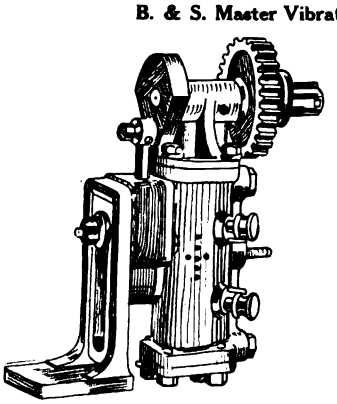
tire pump operated by the compression of the motor. It may be used either as a permanent fixture on the motor or attached only when it is desired to use it. When fitted permanently, a hole is tapped into the cylinder head in which the pump is screwed, operating horizontally instead of vertically as seen in the illustration, which depicts the temporary installation, with the pump screwed in the spark plug hole. In use, the cylinder to which the pump is attached is cut out from the ignition circuit, the compression of the cylinder being used to operate the piston which forces the air to the tire. Only fresh air is pumped. The outfit consists of the pump, 12 feet of hose and pressure gauge. The pump is made like a motor, with two cast iron piston rings and a connecting rod of high grade steel between the larger piston on which the compression acts and the smaller one which forces the air to the tire. The cylinders are made of gray iron, bored and reamed to exact size.

★

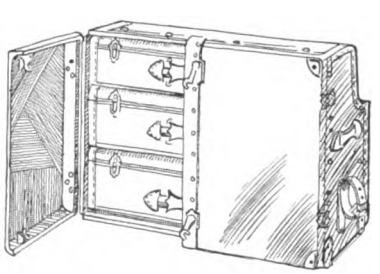


The B. & S. Master Vibrator is made by the Briggs & Stratton Company, Milwaukee, Wis., and was designed with the idea of correcting the timing of a multiple-cylinder motor and increasing its power by substituting one vibrator for three or four. It takes the place of the usual box coil with its several vibrators, each responding to the current at different speeds, held to result in uneven firing. The B. & S. device is small and compact, being 5 25 inches high and 2.5 inches in diameter, and is water and dust proof with an adjustment which is proof against accident or carelessness and yet is sensitive.

★



The Hartford Tire Pump is a double acting single-cylinder pump of great power and capacity. It will pump 1.5 cubic feet of air a minute at a speed of 500 revolutions. That illustrated is designed to be driven from the magneto or pump shaft through a split gear meshing with the gear on pump crankshaft, but one also may be had with a friction wheel, to be driven by contact with the engine flywheel. The gear driven pump is attached to the frame of a car in such position that its gear may be slid in and out of engagement with the gear on the pump shaft. The pump is strongly constructed, the cylinder, piston and piston rings being of cast iron. The piston is of the double type, hollow, and with two valves, one in each head. The pump may be attached where convenient, and is 9.5 inches in height, 3.5 inches in width and 8.5 inches long. It weighs 13 pounds and is tested to 150 pounds pressure. The cylinder bore and stroke are 1.5 inch. The outfit consists of the pump, gears, hose and pressure gauge. To use the gear pump, the motor is stopped, pump gear slid into engagement with gear on magneto shaft and engine started. It is made by the Hartford Pump & Manufacturing Company, 7 Arch street, Boston.



Brown Tire Pump

B. & S. Master Vibrator

Hartford Tire Pump

Ajax Trunk

★

Ajax Trunks are made by the Ajax Trunk & Sample Case Company, 91 Mercer street, New York City, and are well known. The No. 406 suit case trunk, made especially for automobile use, is illustrated. This carries three suit cases, and is so shaped that it will fit on the trunk rack in the rear of a car, the top portion being cut in for about 10 inches to allow the lower part to go under the overhang of the car body. The doors swing outward like wardrobe doors, and each case is placed on an independent shelf which it fits exactly, so that one may be removed without disturbing the others. It is made throughout of the best materials, and is lined with green felt. It may be had in three lengths, 28, 30 and 32 inches, the width and height being 16 and 24.5 inches.

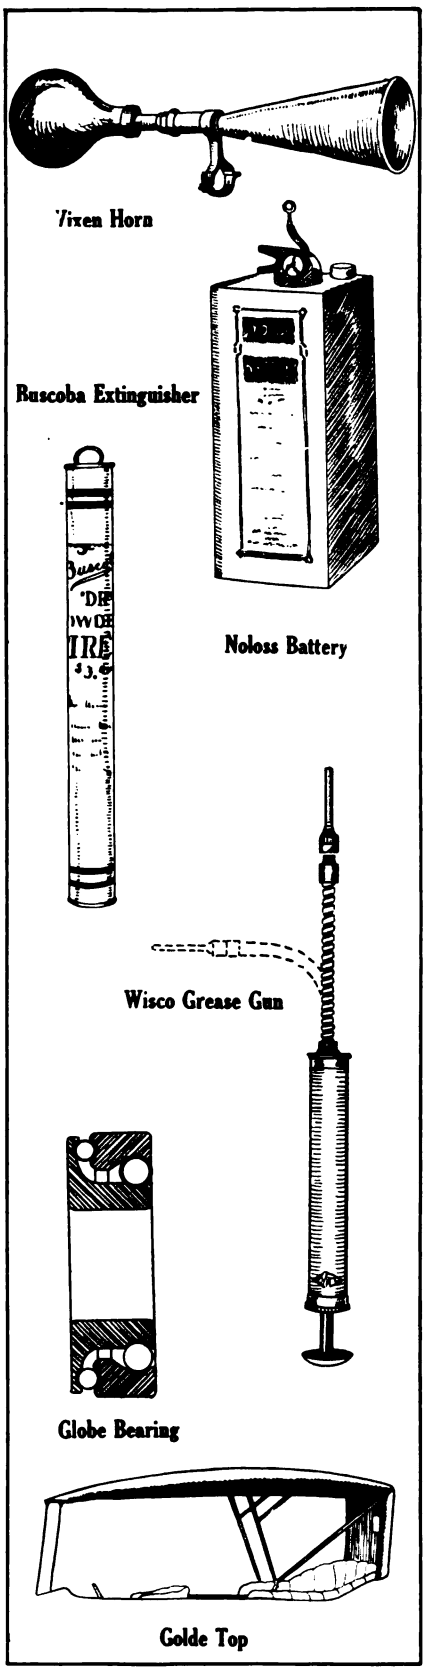
★

The Vixen Horn is in external appearance similar to an ordinary bulb horn, but the sound it makes is that of a siren. It is manufac-

Digitized by Google

tured by the Motor Car Equipment Company, 55 Warren street, New York City. The device is quite unique in combining in a bulb horn the siren quality. Instead of the customary reed there is a small mechanical siren of considerable power which emits the characteristic note which attracts attention even in the traffic roar of a large city. It is stated that the sound is not too loud for city use, and possesses sufficient penetrative ability for use in the country.

★



The Noloss Battery is an innovation in ignition batteries, being a wet battery in dry battery form, thus possessing the advantages of both. It is made by the Burn-Boston Battery & Manufacturing Works, 9 Doane street, Boston, and consists of a wet battery in a can so sealed that it cannot leak, spill, or appreciably evaporate. It thus combines the long life of the wet battery with the portability of the dry cell. The cell is the same size as the regular dry member, and gives the same voltage and amperage.

★

The Buscoba Dry Fire Extinguisher is, as its name indicates, a fire extinguisher of the dry powder variety. It is made by the Bush-Scott Company, 31 Woodward avenue, Detroit, and consists of a tin tube filled with a dry chemical which when thrown at the base of a fire generates a gas. This gas does not support combustion, as it does not contain oxygen, and thus puts the fire out. The extinguisher will be appreciated by the motorist, as it is not bulky to carry, being 22 by two inches, and gives effective protection against gasoline and oil fires.

★

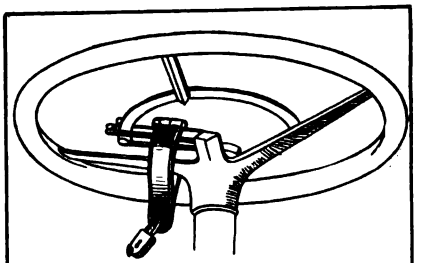
The Wisco Grease Gun is made by the Wilson Instrument & Specialty Company, Passaic, N. J., the No. 5 gun of this company being illustrated. It may be used for either oil or grease and is fitted with a flexible spout which enables the contents to be shot into the most inaccessible places.

The spout may be turned through any angle from zero to 90 degrees, and is provided with a thread to screw into a grease cup, facilitating loading a bearing. The gun will be appreciated by motorists who have tried to load grease or oil into a bearing on a car while on the road, only to have most of the lubricant escape to the ground on account of the awkward position of the gun. The flexible spout enables the contents to be delivered where desired when held in any position.

★

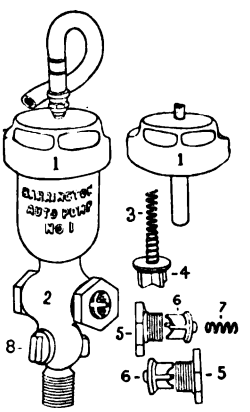
The Globe Ball Bearing is a new type of combined ball radial and thrust bearing, being placed upon the American market by the Globe Ball Bearing Company, 50 Church street, New York City. It is made by the Societe de Mecanique de Precision of Clichy, France. The construction is easily seen in the drawing. There are two ball races, one of which bears the radial load, while the other takes care of the thrust. The bearings will be found of especial advantage in axles, where there is considerable thrust as well as radial load to be taken care of.

★



The Golde Top is made by the Golde Patent Manufacturing Company, Inc., 509 West 56th street, New York City, and contains several new features. As may be seen in the illustration, it has no bow irons for the front seat, there being but a single bow socket on each side. In front of this the top is supported by hinged rods. This construction is such that it may be adjusted nearly as quickly as the old horse buggy top, there being no bows to fit in sockets, etc. No springs are used, and the whole is quite durable. Two styles are offered, one with tapering oval steel rods finished in black enamel, and the other with wooden bows and steel and wrought iron trimmings, the metal being finished in black and the wood in the natural color. The cloth material may be water proof canvas, mohair, or Pantasote.

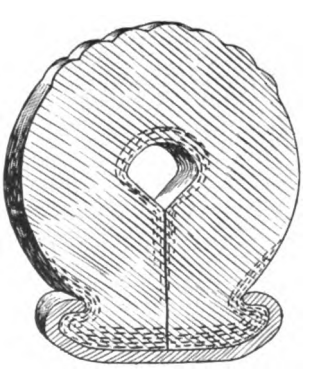
Digitized by Google



The Watch Dog Lock is one of the newer automobile locking devices on the market, and will no doubt be quite popular. It is simple in construction, consisting of a pair of hinged arms adapted to go around the steering wheel spider and the throttle and spark levers. It is made by S. Breakstone, 1712 Michigan avenue, Chicago, and may be had with or without the padlock, that which is sold with the device being of Corbin make. The advantage of locking the spark and throttle levers lies in the fact that while the car can be moved about the garage, it cannot be run under its own power, so that while protection from theives is made, the car is not immovable. This is a decided advantage in public garages, where the car must be moved by the employees to make way for other machines, or for washing.

★

The Barrington Automatic Pump is made by the Barrington Automatic Automobile Pump Company, Short and South street, Harrisburg, Penn., and is of the compression power variety. The pump is designed to be attached permanently to the engine, being screwed into a hole tapped in the cylinder head. It is only 6.5 inches high, allowing the hood to be closed when not in use. It is simple in construction, with few wearing parts, as may be seen in the illustration. While it may be used as a detachable pump and screwed into a spark plug hole, only when it is desired to use it, trouble may be saved by having the pump attached permanently. In the illustration 1 is the cap forming the top of the compression chamber; 2, the body of the pump; 3 and 4, check valve and spring located in the bottom of the chamber; 5, 6, 7, intake check valves and spring; 8, stop cock to throw the pump out of action when not in use. The pump operates with the engine throttled low as follows: The motor piston on its downward stroke draws air through the two intake valves 5 and 6; the next upstroke of the motor piston forces this air up through the neck of the pump, past the check valve 4 and into the pump compression chamber, from which it goes to the tire.



Watch Dog Lock

Barrington Tire Pump

Treadmend

Cleveland Tire

★

Treadmend is being placed upon the market by the Liberty Rubber Company, Orange, N. J., and consists of a preparation especially made to fill up holes in the tread of a tire and sealing up cuts. In the care of a casing one of the essentials upon which the tire manufacturers insist most strenuously is the quick attention to small holes and cuts. Through a small hole which might be thought harmless an astonishing quantity of sand will pass, resulting in the familiar sand blister which may remove a considerable section of the tread and need the services of a professional vulcanizer. To prevent such blisters, all holes should be filled up as soon as seen with some such preparation as Treadmend.

★

The Cleveland Air Cushion Tire is made by the Cleveland Puncture Proof Tire Company, Columbus, O., and has been designed to derive some resiliency from air, at the same time combining with it the non-puncturing qualities of the solid tire. The construction is seen in the illustration. The tire is solid save for a central air chamber, which communicates with the outer air through a slit in the base, which is lined with friction cloth. The result of this construction is claimed to be that when the tire strikes an obstruction the pressure on the rubber closes the slit and compresses the air, which then lends its resiliency to that of the rubber. This effect is obtained without the use of inner tubes, valves or inflation, so that there is no danger of blowouts, punctures or leaks. The tire is made in standard sizes to fit the standard clincher rims, and is provided at the base with a rubber covered layer of friction cloth to provide against cracking. The tread is beaded to prevent skidding and afford a wearing surface.

IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

THIRTY SAURERS FOR PORTO RICO.

After thoroughly investigating the possibilities, the Porto Rico Motor Company has been organized with headquarters in San Juan and Ponce, Porto Rico, for the purpose of establishing a freight service between several of the larger cities and towns on the island. The type of vehicle selected for this work is the five-ton Saurer, made by the International Motor Company at its plant in Plainfield, N. J., the initial order being for 30 cars.

The business of the island is increasing at a rate varying from 16 to 20 per cent. annually, as shown by the reports of the customs service. Railroad transportation is limited practically to one line which keeps near the coast, running from Carolina across the north coast to Aguadilla, down the west end and along the southern to Guayama. Coffee, tobacco and a portion of the sugar is raised in the interior, and the problem is that of carrying merchandise and provisions to these plantations and bringing out the produce. The truck lines will run across the island from north to south, starting from San Juan and Ponce.

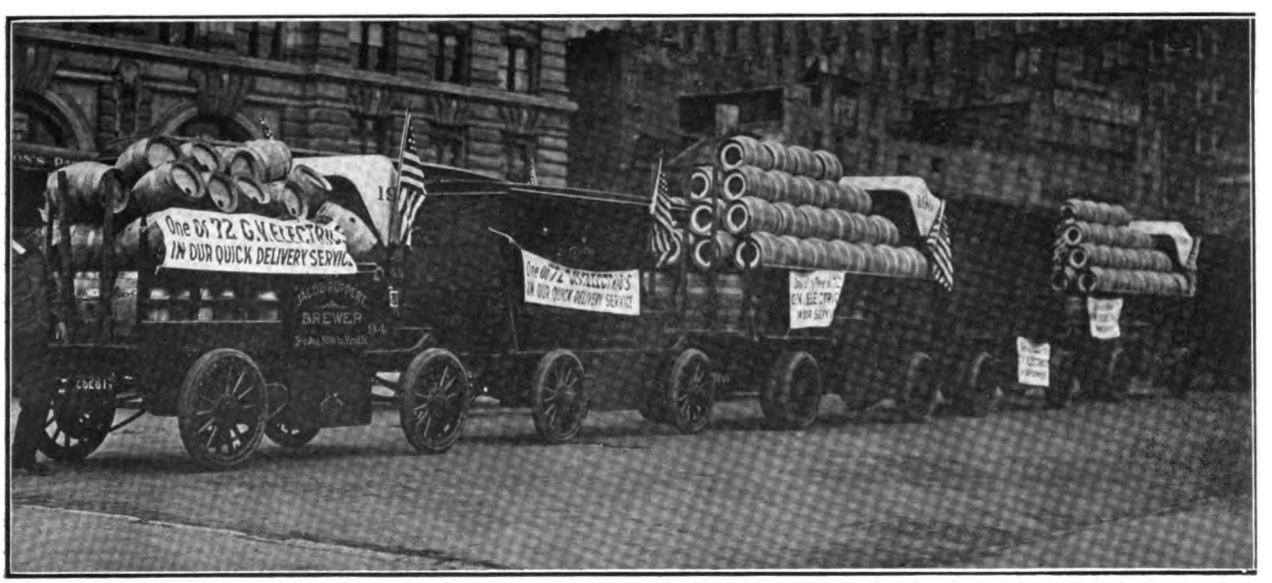
In these vehicles, the first installment of which is shown herewith, the motor is of the four-cylinder, four-cycle, water-cooled type with T head cylinders cast in pairs. The inlet and exhaust valves are made interchangeable, of nickel steel, and operated by separate camshafts. All shafts are of chrome nickel steel and are mounted on high grade annular ball bearings of very large diameter.

The cooling system consists of a honeycomb type radiator of very efficient design, through which the water is circulated by a centrifugal pump. A large fan placed directly behind the radiator supplements its action, and the cone clutch is provided with fan shaped arms which assist in removing the heat. Lubrication is by force feed, operated by a pressure pump. Ignition is by high-tension magneto.

The selective sliding gear transmission affords four speeds forward and reverse. Gears are made of nickel steel and all shafts are carried on large ball bearings, thrust bearings also being fitted wherever necessary. Drive is by shaft. Three sets of brakes are provided, one located on the differential, one on the rear wheel sprockets, and the third the special patented Saurer motor air brake. Tires are single in front and dual in the rear.

G. V. ELECTRIC BREWERY WAGONS.

Jacob Ruppert, the well known brewer, New York City, apparently is a decided convert to the practical utility of the electric vehicle for quick delivery purposes. This is not an isolated instance, for several of the brewing companies in the metropolis maintain



First Installment of Saurer Cars Recently Shipped by International Motor Company for Freight Work in Porto Rico.

Digitized by Google

large fleets of this type of car. The Ruppert equipment consists largely of G. V. machines, made by the General Vehicle Company, Long Island City, N. Y., although it should not be understood that the entire transportation system of the concern is limited to these, several horses and a few gasoline trucks being included as well.

The accompanying photograph was taken near the Battery, during the progress of the recent commercial vehicle parade, and while the signs on the sides of the wagons announce that they are a part of a fleet of 72 G. V. electrics, this statement is slightly misleading. As a matter of fact, Jacob Ruppert now has four two-ton, three 3.5-ton, two one-ton and 39 five-ton cars in actual service, making a total of 48, while repeat orders have been filed for four two-ton, two 3.5-ton and 29 five-ton vehicles, which will bring the aggregate to 83, when these have been delivered.

The electrics are utilized in the so-called quick delivery system. It will be noted that the five-ton machines predominate, and the rated mileage for these is 35 miles, carrying a load half of the time. The actual experience has been such as to exceed this very materially, and provision is made for rapid exchange of batteries, so that some of the vehicles are often required to be in continuous service for 23 hours at a time. That the result has been satisfactory in every way would appear to follow from the fact that so many repeat orders have been filed.

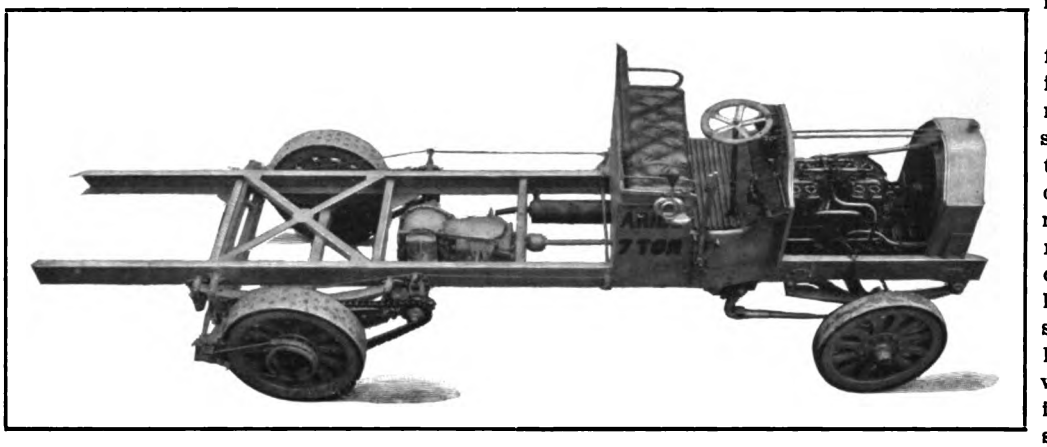
Portion of Jacob Ruppert's Fleet of 72 G. V. Electric Vehicles in Brewery Service in New York City.

FIVE G. M. C.'S REPLACE 20 HORSES.

A lumber firm in St. Louis, Mo., has experienced splendid success with G. M. C. cars, made by the General Motors Truck Company, having had one of these vehicles in service for the past two years. Recently it purchased four machines of the same make, and the five now replace 20 horses, all of the animals having been sold. One of the cars is of 2.5 tons capacity and the others carry loads of five tons each.

When the horses were sold the wagons were retained, and the company finds them decidedly available for use in making up loads. The men in the yard pile the lumber on these bodies while the trucks are making deliveries, and upon their return the load is transferred without delay. The same plan has been adopted by a number of similar concerns throughout the country.

THE STEEL SHOD ARIES.



Considerable interest attaches to the seven-ton Aries truck, made by the Aries Manufacturing Company, Villeneuve-la-Garonne, France, and represented in this country by J. Jaccard & Co., 213 West 69th street, New York City. While there are a number of distinctive features in this product, perhaps none stands forth so prominently as the steel shod wheels. In fact, is may be said that the entire design is built around this factor.

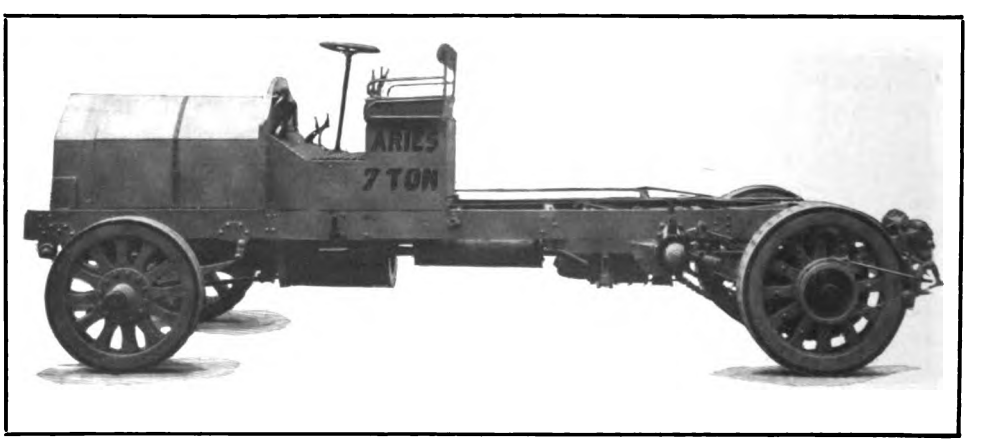
The motor is a four-cylinder, four-cycle, water-cooled unit, rated by the maker at 40 horsepower. The bore is five inches and the stroke 5.75. The location is in front of a hood, although an option is offered for those who desire it placed under the floor. In either case, full accessibility is afforded, the mounting being on a special steel sub-frame, bolted against hard wood members which are in turn bolted to the side frame proper. In addition, it should be mentioned that this form of suspension is calculated to present a cushioning effect and completely to eliminate all minor vibrations.

Ignition is by Bosch high-tension magneto. The carburetor is of special design, and so constructed as

Digitized by Google

to operate successfully with gasoline, benzol, naphtha or alcohol. The lubrication system is automatic, a pump being employed to force the oil through the crankshaft to all working parts of the motor. A sight feed on the dash informs the operator as to the condition of the supply at all times. An extra large radiator of the tubular type is mounted forward of the engine, a gear driven pump keeping the cooling water in circulation. A six-bladed fan, directly behind the radiator, further aids in this function.

Semi-Plan View of Aries Chassis, Showing Also Construction of Steel Tired Wheels.



The clutch is of the dry disc type, employing 39 discs, alternating with bronze and steel. The transmission is of the selective sliding gear type, affording three speeds forward and reverse. Final drive is by side chains. Two sets of brakes are provided, one acting on the differential and the other on the rear wheels. Springs are semi-elliptic all around.

The wheels are of the artillery wood type, but with the hubs supplied with unusually deep flanges, thus considerably increasing the sturdiness of the assembly. The spokes are made of a hard and fibrous wood, air dried by a natural process. Absolutely no kiln dried wood is used. The spokes are cut in conformity with the grain of the wood, so that the grain follows the straight line of the strains in them with accuracy. The whole is bound together by a specially constructed rim or felloe.

This latter is built up of small pieces of French elm, and each section is subjected to a thorough examination before being assembled. It is understood that the wood from which these are constructed is of such close grain, hard fibre and solid structure that it is one of the few woods which will not float in water. It is pointed out that this characteristic should convey some idea of the strength and strain-resisting qualities inherent in it.

The Aries tires, for which so much is claimed, are made of Creuzot steel, which is held to possess the quality of being neither too hard nor too soft, and of being sufficiently tough to withstand constant hammering in service without cracking, and without stretching or expanding. It is held that when these are once placed on a wheel, they need no further attention.

Inasmuch as this particular brand of steel cannot be welded, the tires are cut from a solid billet, which has been brought to a predetermined heat, and a mandrill forced through the centre, thus leaving the billet in the form of a heavy washer. This is next placed in a special machine, and tapering mandrills are driven through the centre, expanding the whole and compressing the fibre of the metal which eventually is to form the tire. This operation is repeated, with heating between each operation, until the billet roughly assumes the shape desired, after which it is placed between two rollers and held under constant pressure. These proceed to roll the tire flatter and flatter, and at the same time still further compress the fibre, driving the molecules into closer relation with each other, until they are ready for the special hydraulic press. This consists of many hydraulic pistons placed radially around the rim of the wheel. These work in perfect unison and subject the rim to

Side View of Aries Seven-Ton Chassis, Ready for the Body Installation.

Digitized by Google

pressure uniformly throughout its entire circumference, and knead the steel tire into the wooden felloe. This operation is repeated 14 times, thus tightening the tire on the wheel, and each time with a new setting of the wheel in the machine, until wood and metal form one compact mass.

Mail Wagon Fitted with Motz Cushion Tires.

After the tire is firmly seated, binding the wheel under great pressure, the entire assembly is trued up on a lathe thus insuring that both wheel and rim are absolutely concentric and perfectly centred. A conical hub is then inserted in the centre of the wheel, also by hydraulic pressure, insuring uniform radial strain on the spokes. This central hub tends to force the spokes outward against the inward pressure of the specially applied rims, and at all times the compression under which the spokes are held maintains the wheel absolutely true, circular, and free from warp or twist.

It is claimed that no Aries tires have ever been worn out in service, although many of them have covered great mileage, in some cases as high as 80,000 miles. The Aries company guarantees them for no less than 100,000 kilometers (60,000 miles). The company is prepared to furnish an extra rim fitted with rubber block tires for winter service, if desired.

MOTZ TIRES IN MAIL SERVICE.

The United States government has decided that the success demonstrated in other fields of endeavor has been sufficient to warrant the use of an automobile for the collection of mails in Washington, D. C. The car shown in an accompanying illustration has covered a distance of 105 miles a day, making on an average of 998 stops, for several months, and it is conservatively estimated that it is doing the work of at least four horse wagons.

Service is expected regardless of weather and road conditions, and in this respect much depends upon the nature of the tire equipment. In fact, it may be stated that one of the factors which has delayed the adoption of the mechanical conveyance in this work has been the cost of maintenance, in which tires play a decidedly prominent part.

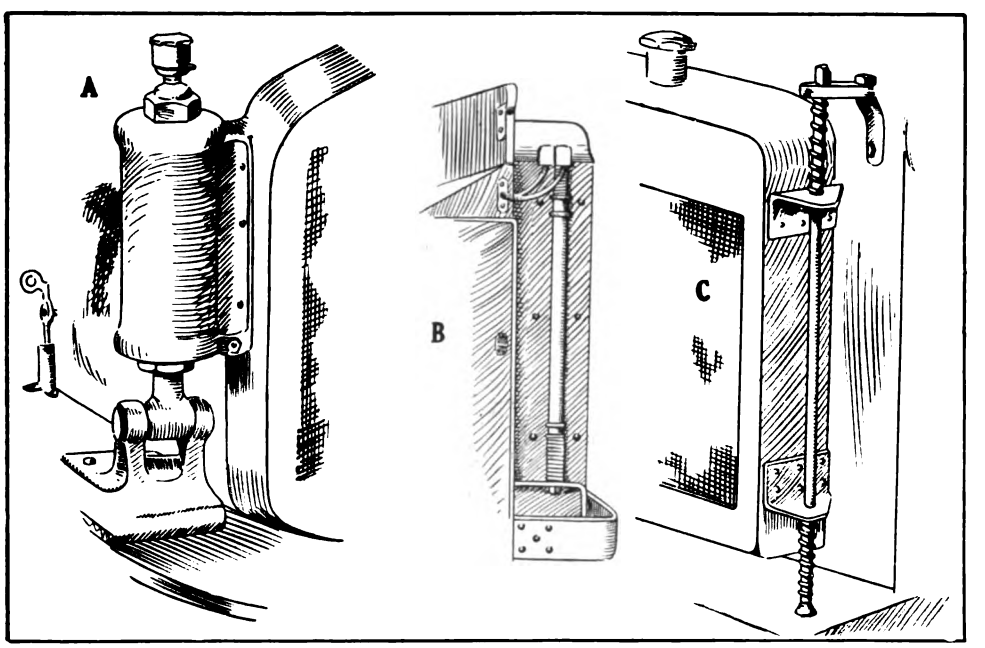
This car is shod with Motz high efficiency cushion tires, made by the Motz Tire & Rubber Company, Akron, O. The company maintains that these are puncture proof and as resilient as properly inflated pneumatics, the latter quality being due to the double treads, under-cut sides and slantwise bridges that characterize this make. The equipment has given exceptionally good service in this instance.

KNICKERBOCKER FOR PIANO MOVING.

Many piano houses throughout the country have come to realize the importance of the motor vehicle in solving some of the problems which confront the transportation of these instruments. An accompanying illustration presents a Knickerbocker truck, made by the Knickerbocker Motor Truck Manufacturing Company, New York City, and in service with W. L. Burnes in that city. It ought to be stated that the uniformed driver does not wear this outfit in the usual performance of his duties, the vehicle and operator being on dress parade when the photograph was taken.

These cars are made in two sizes, with carrying capacity of 3.5 and five tons, respectively. The design is essentially the same with each. The motor is a four-cylinder, four-cycle, water-cooled unit, rated at 35-40 horsepower in the smaller, and 40-45 in the larger. The bore and stroke is 4.5 by five, and 4.75 by five, respectively.

Cylinders are of the L head type, cast separately and arranged vertically under the floor. Complete accessibility is afforded in an interesting and novel manner. The honeycomb radiator is suspended on springs which are attached to the bumper. This latter is hinged so as to swing open, carrying with it the radiator, when the motor may be withdrawn with its hickory sub-frame, much the same as a drawer is withdrawn from a desk.



Knickerbocker Truck in Piano Moving Work with W. L. Burnes, New York City.

Digitized by Google

Lubrication is by means of a positive gear driven pump located at the bottom of the commutator shaft and contained within the lower half of the crankcase. Ignition is by Bosch magneto.

The clutch is a large leather faced cone member, which sets in a cone shaped metal ring bolted to the flywheel, instead of in the flywheel proper. The transmission is of the selective type, affording three speeds forward and reverse. This is of the constant mesh design, the sliding members being hub clutches which engage freely.

Two sets of brakes are fitted, one on the jackshaft and the other on the rear wheel. Springs are semi-elliptic, with auxiliary coil springs at the rear. Wheels are 36 inches in diameter, with five-inch single tires in front and four-inch dual members in the rear on the 3.5-ton, and six-inch single front, and six-inch dual rear, on the five-ton. Any type of body will be fitted by the company at extra charge.

Some Methods of Radiator Suspension: A, White; B, Pope-Hartford; C, Sanford.

METHODS OF RADIATOR MOUNTING.

There is a growing tendency upon the part of truck manufacturers to install the radiator upon springs which are intended to absorb the strains due to chassis distortion and to eliminate the vibration. However, in carrying out this feature of construction there is more or less difference of opinion among designers. In the Sandusky machines, for instance, the radiator is on springs carried on brackets and guides, and these in turn carry other brackets and guides supporting the gasoline tank.

The White suspension, which is shown at A in the accompanying sketch, utilizes shock absorbers, which are cylinders of large diameter enclosing helical springs above pistons. The lower ends of these plunger rods are attached to bolts set transversely in brackets on the chassis frame. The radiator is so hung that it may be moved slightly in any direction without any stress whatever upon it.

The Victor trucks have a bracket at either side, in which a hole receives a bolt anchored in the chassis frame, this bolt forming the guide for a short helical spring that resists all action. To prevent the heavy curved cross member on the frame in front of the radiator from reducing the radiation the member is perforated with three rows of holes.

Into the reinforced sides of the radiator frames on the Federal and carried on stout steel rods, are two short helical springs of large diameter, separated by a substantial lug. This arrangement gives a decidedly neat and finished appearance.

The Pope-Hartford suspension is with rods fixed to the chassis frame on a bracket and to the radiator at the top, as indicated at B. The helical springs at the top and bottom of the rods are provided with collars to retain them in position.

The Sanford mounting at C is somewhat similar, rods being anchored in the chassis frame and held in brackets on the dash at the top. At both the upper and lower ends of these rods are the helical springs that are slightly compressed between brackets on the radiator frame and effectually resist any distortional action on the part of the chassis.

ELECTRICS IN EXPRESS SERVICE.

Express companies throughout the country are finding that electric cars meet their needs in every particular. One of the most recent orders received by the Baker Motor Vehicle Company, Cleveland, O., was a repeat for 28 two-ton Baker electrics for use by one of these concerns in Washington, Baltimore, New York and Chicago. The Westcott Express Company of New York has placed a repeat order for 12 vehicles of the same make and type.

The Adams Express Company of New York City, which already has in service a fleet of nearly 100 G. V. electrics of two tons capacity, made by the General Vehicle Company, Long Island City, has ordered 37 more of the same type, and the American Express, 58.

ARMY FIELD WAGONS.

In a recent issue of the Infantry Journal, Capt. Alexander E. Williams, 19th Infantry, U. S. A., writes interestingly concerning the experiments of the American army with automobile transportation. According to Capt. Williams, the United States has gone much further in this regard than any foreign country, in that it is now working upon a plan to secure a suitable motor field wagon, something which other nations have decided cannot be found. Not only has the American army made its plans, but has designed and is having built a machine which, it is expected, will prove suitable for field service.

Along this line, it is understood that the War Department will continue its experimentation with trucks in connection with the various militia manoeuvres throughout the country this coming summer. Details have not been worked out, but the plans call for an even more thorough test than was accomplished during the summer of 1911, in which vehicles of several makes conducted themselves with great success.

Capt. Williams is authority for the statement that the government is now considering the advisability of offering a subsidy, similar to that now in vogue in other countries, notably France, Germany and Austria. Steps have been taken to obtain from motor truck manufacturer reports of the sale of each machine, with the address of the purchaser, and the size and power of the vehicle. It is felt that this scheme will prove less costly than the purchase of a large number of cars outright, although it is admitted that considerable money must be available for this purpose, once the plan is put into active operation.

The results of the recent road test, from Washington, down through the South and back to Fort Benjamin Harrison, Indiana, in which five cars were entered, have not been made public as yet. The participants were: Autocar, Autocar Company, Ardmore, Penn.; Four Wheel Drive, Four Wheel Drive Auto Company, Clintonville, Wis.; Mais, Mais Motor Truck Company, Indianapolis, Ind.; Sampson, Alden Sampson Manufacturing Company, Detroit, and White, White Company, Cleveland, O. The route covered 1509 miles, over some of the worst roads in the country, and the detailed report of the army officials will be awaited with interest.

Mais Army Field Wagon Which Recently Was Subjected to Governmental Test.

TRUFFAULT-HARTFORDS WIN.

Manufacturers of accessories are beginning to appreciate the value of long distance racing events in indicating the merit possessed by their product. This has applied for some time in the matter of tires, carburetor, magneto, etc., but it is more or less true that special attention was not paid to other fittings until recently.

It is of interest to note, in this connection, that the Fiat car driven by Teddy Tetzlaff to win the recent Santa Monica road race of 303 miles and thus establish a new world's record, almost four miles an hour in excess of all previous marks for road work, was equipped with Truffault-Hartford shock absorbers, made by the Hartford Suspension Company, Jersey City, N. J. Ralph De Palma, driving a Mercer, also utilizing Truffault-Hartfords, won the medium car event, covering 151 miles at a speed averaging 69.54 miles an hour.

CZAR BUYS STODDARD-DAYTON.

The Czar of Russia recently gave foreign car makers further cause for anxiety over the American "invasion" by purchasing an American car, a Stoddard-Dayton landaulet, made by the Dayton Motor Car Company, Dayton, O., a constituent of the United States Motor Company, New York City.

FORD IGNITION AND ADJUSTMENT.

It is surprising to note the large number of owners of the model T Ford who fail to obtain the maximum efficiency from the motor because of a lack of practical working knowledge of the ignition system and an inability to adjust the coil properly. The writer has noted from time to time, that many new operators, and even some with experience, rely upon the agent or salesman to tune up the coil, a task that may be performed by the owner if he understands its principle and application in practise. Frequently the failure of the car to operate smoothly is due to one or more of the coil units not being synchronized with the others, or to causes which will be outlined herein. In order to overcome ignition troubles the driver should understand the operation of the system which will be explained in non-technical language for the benefit of the novice.

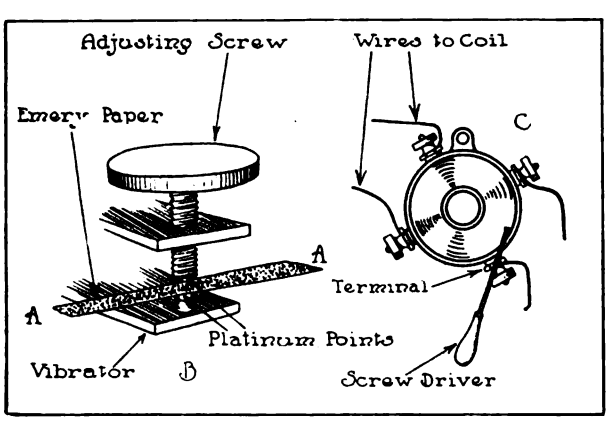

Fig. 1—Ignition Hints: B, Cleaning and Truing Coil Points with Emery Paper; C, Method of Testing Primary or Secondary Current with Screw Driver.

Operation of Motor.

The explosive mixture is introduced into the cylinder by the suction of the piston when the latter is moving downward, a movement known as the intake stroke. The next half-turn of the crankshaft carries the piston upward, compressing the gas. This is the compression stroke. The remaining two strokes are firing, a downward movement, and exhaust, an upward stroke of the piston. Those strokes should be borne in mind as they are important in timing the ignition should it be necessary to remove the commutator.

Two valves are fitted to each cylinder, an intake and an exhaust. The former is located easily, being that member in line with the spark plug. The intake valve begins to lift when the piston is moving downward on the intake stroke, and remains open until the movement is nearly completed, and is closed during the succeeding, or compression stroke. The exhaust begins to open slightly before the power stroke is completed.

The cylinders fire 1, 2, 4, 3, and when the piston of the No. 1 cylinder is at the top of its stroke, those of the Nos. 2 and 3 are at the bottom while the No. 4 is at the top. In order to facilitate resetting the timer, the firing order and opening of the valves will have to be considered; that is, if the ignition is not timed by the piston, and the following table, giving the strokes of each cylinder in their respective order, will be of value:

Order of Firing.

Cylinder 1	Cylinder 2	Cylinder 3	Cylinder 4
1—Firing	Compressing	Exhausting	Intaking
2—Exhausting	Firing	Intaking	Compressing
3—Intaking	Exhausting	Compressing	Firing
4—Compressing	Intaking	Firing	Exhausting

When the piston of the No. 1 cylinder is at or near the top of the compression stroke, a spark is supposed to take place at the gap of the spark plug, igniting the mixture, producing a pressure against the piston and driving it downward. At the same time the piston of the No. 2 cylinder moves upward on its compression stroke. No. 4 cylinder is drawing in a charge, while the No. 3 is exhausting, as will be noted by the table.

A separate and distinct spark takes place in each cylinder in the following order, 1, 2, 4, 3. This is accomplished by a device known as the timer or commutator which is attached to the shaft operating the valves. This timer has four insulated terminals, each corresponding to the same numbered cylinder. The interior of the timer is fitted with a fibre ring, a nonconductor of electricity. Inserted in the fibre, 90 de-

Digitized by Google

grees apart, are metal blocks, the surfaces of which are flush with the fibre.

Attached to the camshaft is an arm carrying a roller, and both of these members rotate at camshaft speed, which is one-half that of the crankshaft. The timer proper is loosely mounted and may be moved in either direction for advancing or retarding the spark. It may be compared to a switch in an electric bell system. When the metal roller comes in contact with a metal block in the fibre, the primary circuit is closed and current will flow, but the connection will be broken when the roller comes in contact with the fibre. The roller rotates to the left, when facing the radiator, and makes contact with blocks, 1, 2, 4, 3, respectively, the firing order of the cylinders.

Function of Coil.

The magneto develops a low-tension current, and this electricity is built up or strengthened to force the current to jump across the gap of the spark plug. This is accomplished by the windings in the coil, a primary and a secondary, of coarse and fine wire, respectively. On the top of each unit of the coil is a flat strip of metal carrying a platinum point and directly over a core of iron wires. An adjusting screw is also fitted with a platinum point in contact with the other member. The coil also carries a switch which closes the magneto or battery circuit. It is explained that for electricity to flow a path must be provided for it to leave its source of supply, as well as one for returning. With the motor car but one wire is necessary as the metal of the frame, etc., is utilized as one lead and is known as the ground.

Direction of Current.

When the lever of the switch coil is thrown to "magneto," and the latter is operating, current is being developed, and a circuit is completed when a contact is made at the timer by the roller. The electricity then flows through the No. 1 wire, for example, on the timer. This wire is insulated and the current travels to the No. 1 unit of the coil where it is built up into a high-tension.

The vibrator is drawn down by the iron core or magnet, breaking the circuit, and for each contact of the platinum points a spark is produced at the gap of the plug. This secondary or built-up current is led from the coil by a heavy insulated wire to prevent leakage, and in reaching the plug passes down the metal electrode, which is insulated from the base of the plug and jumps across the gap to the shell. The latter being of metal and in contact with the cylinder, a return path is provided for the current by the way of ground or metal back to the generator or battery. Thus it will be noted that there are two circuits, a primary and a secondary.

Wiring Diagram.

The arrangement of the components of the ignition system is depicted at Fig. 2 A, which also outlines the timer. The sketch shows the connections of the coil on the back of the dash and it will be noted that these are numbered 1, 2, 3, 4, both for the primary and secondary wires. The leads to the plugs are similarly marked. It will be seen that the 1, 2 and 3 wires from the timer lead to the corresponding terminals of the coil, but that the third contact to be made at the timer is connected to the No. 4 terminal of the coil, this arrangement being necessary to bring about the firing order, 1, 2, 4, 3, as previously explained. The fact that No. 4 cylinder fires ahead of the No. 3 is confusing to the amateur in locating troubles and when rewiring the timer.

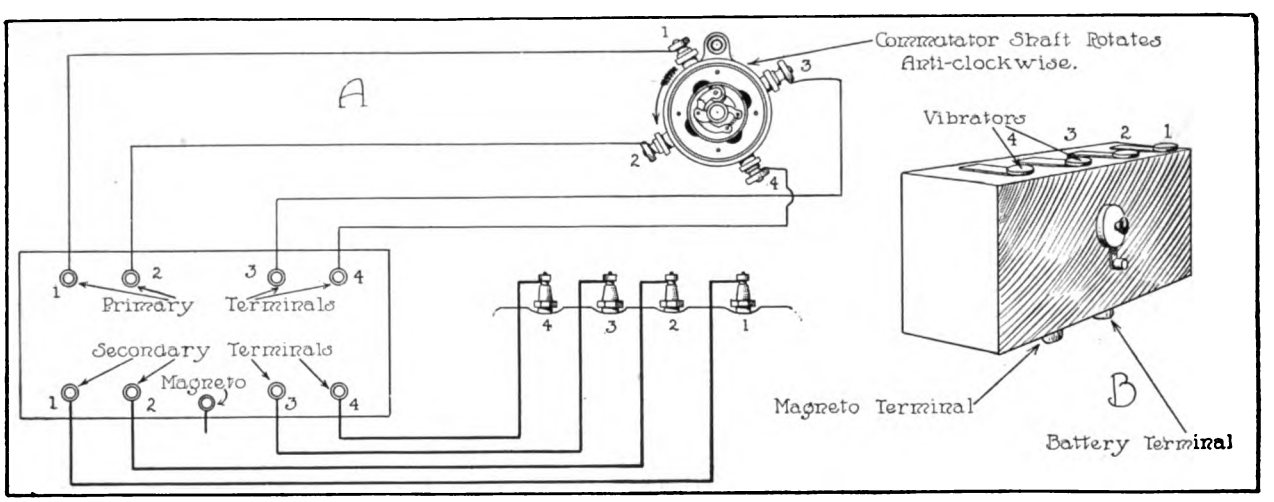

Fig. 2—Outlining Ignition System of Model T Ford: A, Showing Primary and Secondary Leads; B, Depicting Vibrators of Coil Corresponding to Numbered Spark Plugs.

Locating Missing Cylinders.

There are several practical methods of locating which cylinder is missing explosions. The coil may be utilized and B shows the vibrators, these being numbered 1, 2, 3, 4, corresponding to the plugs in the cylinders. The cylinder nearest the radiator is designated as the No. 1. By holding down with the fingers, vibrators 4, 3, 2, with motor running, current will be

Digitized by Google

cut off to all cylinders except the No. 1, and if the plug or coil be at fault the motor will stop. The other cylinders may be tested in a similar manner. If upon screwing down the adjusting member, the vibrator

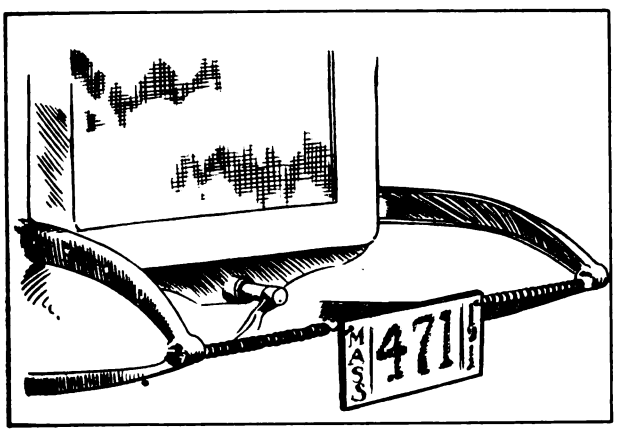

Fig. 3—How License Plate May Be Suspended by Coiled Springs.

buzzes, the fault is likely to be due to the plug which may be examined and replaced by a new one if necessary.

Another method is to short circuit the plug with a screw driver, taking care to utilize a tool having an all wood handle, else one is likely to receive a shock. The metal of the instrument is used to make a connection between the cable terminal and some convenient metal of the motor. This should be done with the cut-out open so as to note by ear the explosions. The spark may be tested in a similar manner by holding the point of the screw driver about .25 or .5 inch away from the cylinders with the other part of the tool in contact with the cable terminal. Still another method, which is more troublesome, however, is to loosen the binding nuts of the spark plugs and take one wire at the time, holding it near metal and noting if a spark jumps the gap. Each wire may be tested in a similar manner.

Testing with Dry Cells.

When the car is equipped with a set of dry cells, the locating of ignition troubles is somewhat easier because there is a constant supply of current with the motor inoperative. Each plug may be examined by turning the motor until a contact is made at the timer for the cylinder in question and with the plugs out and laid on the cylinders, the condition of the spark may be ascertained easily. Care should be exercised to see that only the shell of the plug comes in contact with the metal and not the terminal or exposed portion of the wire.

A simple way of making the contact at the timer is to utilize a screw driver as depicted at Fig. 1 C. This makes a connection similar to that by the roller and contact members. If the coil buzzes with the motor idle, turn starting handle slightly to break contact at timer. The coil may also be tuned by connecting a wire to any metal of the car and placing the other end on the primary connection of the coil and adjusting the screw.

Adjusting Coil.

The coil is adjusted by turning down or up the screw member and when the cylinder does not fire evenly and strongly the screw should be turned down slightly until the explosion is snappy. The contact should be light—just enough to bring about the desired explosion at slow speeds for the voltage of the magneto increases with the speed of the car. The coil should always be adjusted at low speeds. Too severe contact will result in burning the platinum and when this condition exists considerably more current is utilized as the burnt metal sets up resistance.

It is poor policy to use a file to clean these points which require attention from time to time. It is not essential to remove the screw or vibrator for this work and at Fig. 1 is shown a simple method of cleaning and truing the points by the use of the finest emery paper. A narrow strip is utilized and placed between the point adjusted so that they just grip the paper. The latter is then grasped at A A and moved back and forth, taking care to keep the paper in a horizontal position. The paper is then reversed and the lower point treated, after which the unit is adjusted. This saves removing the parts, a task the novice should not attempt.

Wiring Troubles.

The wiring system of the car is very simple and should the wires become broken or removed, they may be replaced easily by following the wiring diagram outlined at Fig. 2. Should it become necessary to rewire the timer the operation will be simplified by noting that the roller and block of the No. 1 terminal are in contact as shown in the drawing. The replacing of the remaining leads will be an easy matter.

If the timer be removed, and the motor cranked by accident so as to change the position of the rotating camshaft, the ignition will have to be retimed. Several ways are suggested but a simple method is to bring the No. 1 cylinder up on the compression stroke, remove plug and insert finger, noting if the

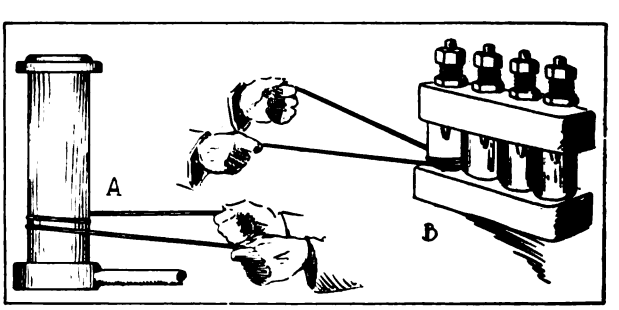

Fig. 4—Method of Cleaning Glass Oil Gauge Tubes with String.

piston is at the top of the stroke, or dead centre. The timer is then replaced with contact being made by the No. 1 block of the timer with the roller. This is the member at the left of the portion to which the

Digitized by Google

lead rod connection is attached. The No. 2 is the next to the left and so on.

The correctness of the leads may be ascertained readily by testing with a screw driver if batteries are installed in the car. From time to time the commutator should be washed out with gasoline or kerosene and refilled with a fresh lubricant. If by accident any one of the primary wires to the member should become broken within the carrying cable, it can be located by the same test as conducted with the screw driver. By keeping the contact points of the coil clean and adjusted properly the car will run smoothly and sweetly, developing its maximum efficiency provided the other components of the power plant are performing their proper function.

SUSPENSION OF LICENSE PLATES.

In most states the law requires the display of two license tags, one at the front and the other at the rear. Some motorists object to drilling the metal body or fender for fastening the rear number and although devices are made for securing the tag to the tail light bracket these involve expense. A simple and inexpensive method of suspending number plates is depicted at Fig. 3 and as will be noted, consists of two spiral springs one end of which is hooked into the number tag and the other extremity secured to the spring bolts. The springs should be substantial and considerably shorter than the distance between the frame so that the plate will be held securely and prevented from swinging.

CLEANING GLASS OIL GAUGES.

Many oiling systems of the motor car include a tube-like gauge of glass which is utilized to denote the amount of lubricant being fed by the system or the quantity in the container. Where these members are exposed they accumulate dust and dirt, making it difficult to note at a glance whether the oil be dropping or the amount registering.

Many owners of the model T Ford fit a gauge to the crankcase and as it is exposed, it collects dirt. While the centre may be cleaned easily the lower portion is more difficult. At Fig. 4 A is presented a suggestion for removing foreign elements when a cloth fails. It consists of taking a coarse, soft string and making a couple of turns around the glass, drawing one end of the twine and then the other, imparting a sawing motion as outlined in the sketch. If the string be soaked in gasoline, the incrusted deposits will be removed easily.

Where sight feeds are fitted to the dash such as shown at B, it is impossible to get back of these members with a cloth when cleaning. The string kink may be utilized, employing a piece of fine wire attached to one end of the twine to enable the material to be passed around the tube.

AFFORDING AN AUTOMOBILE.

The question as to those who can afford an automobile was considered recently by R. C. Hupp, of the R-C-H Corporation, Detroit. He emphasized the fact that the horse does less and poorer work, but is never called extravagant, adding: "As far as I know a man always bought a horse because it was a profitable investment. Why an automobile should be purchased for any other reason is a mystery."

According to Mr. Hupp, anyone who can afford a horse can afford an automobile, and in fact should purchase one and save money. A machine is more economical than the horse on account of the greater territory which can be covered. A light car can be operated over 1000 miles of ordinary roads a month at a cost of $10 for oil and gasoline, with a total expense account of $20, including tire expense and interest on investment. Few horses cover 700 miles a month, and cost at least $25 for feed and shoes, without considering interest and depreciation, which latter would amount to a large item for a horse driven 25 miles a day.

RAYFIELD IN CONTEST WORK.

The Rayfield carburetor, made by the Findeisen & Kropf Manufacturing Company, Indianapolis, Ind., is quite popular with racers, who appreciate the importance of the carburetor in contest work of all kinds. The list of race winners discloses many drivers who use the Rayfield, no matter what car they drive, included among whom may be mentioned: Disbrow, Nikrent, De Palma and Mulford. In economy and reliability contests the member is prominent, cars equipped with it showing marked efficiency. In the recent Quaker City Motor Club gasoline economy contest, the winning American used a Rayfield, and scored 9.63 points out of a possible 10, by making a little under 23 miles to a gallon of gasoline. In the reliability event six Case cars which finished without penalty carried the Rayfield, and Mrs. D. W. Harper, who captured the Women's Prize, used one on her Case.

CLEVELAND AUTOMOBILE COUNTRY CLUB.

The Cleveland Automobile Club, composed of prominent motorists of the Ohio city, has formed the Cleveland Automobile Country Club, and secured for a clubhouse the Dover Bay Park hotel, situated on a bluff overlooking Lake Erie, 12 miles from the city. The grounds are large and pleasant, and the proximity of the lake gives opportunity for water as well as land sports. Cottages may be rented, or rooms secured in the clubhouse, and it is expected that the local motorists will avail themselves of the opportunity to secure all the pleasures and benefits of a country club at small cost.

Advocate uniform motoring laws in the interests of pleasant and profitable interstate touring.

PRESERVING CRAWFORD NOTCH.

The State of New Hampshire is to be commended and the people of the United States to be congratulated upon the action of Gov. Robert P. Bass in taking the initial step toward the acquisition by the commonwealth of Crawford Notch, one of the most famous beauty spots in America. Thousands of motorists have taken advantage of the liberal touring laws in New Hampshire to visit all sections of the White mountains and are thoroughly familiar with the particular charm of this locality.

The step has not been accomplished without considerable effort. Gov. Bass was hindered at every turn by a number of large timber concerns, who refused to set any price upon their property and were actively at work destroying the natural beauty of the place by felling the big trees on the wooded slopes. Appeal was made to the supreme court, which tribunal has just handed down a decision in favor of conservation.

As a result, a commission will be appointed to go over the property and assess damages upon it. The state will begin surveys at once, and the commission will make the award, after which the property will be acquired and saved to all time for the people. The motorists of the entire country will be under a debt of gratitude to Gov. Bass, which will not soon be forgotten.

WIRE VS. WOOD WHEELS.

For some time past there has been a growing tendency to revive the old discussion concerning the respective merits of wire and wood wheels. While there has been some effort to create the impression that satisfactory wood for the purpose was becoming scarce, this contention has been denied vigorously by those who are perhaps in the best position to know. However, the situation has been sufficiently acute to warrant investigation of the advantages claimed from the use of wire members.

Across the water, the wire wheel not only has held its own but has been growing steadily in popularity. It is quite significant that many of the American cars sold in these foreign countries are thus equipped either by the agents or by the owners directly after purchase. It is claimed that a majority of the machines entered for the Grand Prix in France next month are to be fitted with wheels of this type.

And this brings up the fact that at least one car entered for the 500-mile race on the Indianapolis speedway, Memorial Day, is to be fitted with wire wheels. Perhaps no better object lesson could be devised than will be provided as a result of this test, and there is every reason for believing that the outcome of the experiment (for such it must be regarded) will be watched with interest by the great body of American motorists, as well as the motor car manufacturers.

OPENING OF GLACIER PARK.

It is indeed welcome news that the United States government has decided to open Glacier national park in Montana to automobile traffic under suitable restrictions. If this action presaged a similar decision with respect to Yellowstone national park, the motorists of America would be still better pleased.

Now that a step in the right direction has been taken and a precedent has been established it will be more difficult than ever for those in authority to explain to the satisfaction of automobile owners and users the necessity for forbidding these vehicles in

Digitized by Google

other national preserves. The argument that was raised, with respect to the animals which would be frightened, cannot be expected to hold, since there is every reason to believe that the animals in Glacier park are just as primitive as those of Yellowstone park.

It has been pointed out, time and again, that one of the things which has prevented the popularization of transcontinental touring in this country has been the failure of the United States government to lend its aid in opening up the beauty spots to automobile traffic. America has just as many attractions as Continental Europe, and one of the principal reasons why Americans do not "See America First," is because they have not been encouraged to do so by those whose first duty it should be to lend every material aid. It is to be hoped that the opening of Glacier park marks the beginning of a new era in this regard.

A DANGEROUS PRACTISE.

While there is every reason to believe that their number is decidedly limited it is nevertheless a fact that there exist certain experienced motorists who find great pleasure in the discomfiture of new owners whom they meet upon the road. One of the favorite amusements of this class is to run directly in the middle of the highway until almost in front of the other car before suddenly turning to the right and just clearing the novice's machine. This is a decidedly dangerous practise, largely because of the possible failure of a steering gear or some other important part of the steering mechanism, in which event the probability of a serious accident is decidedly in its favor.

In this connection it may be remarked that the old time courtesy, which was accorded by one motorist to another whom he might meet in trouble on the road, is fast becoming a lost art. It ought to be unnecessary to suggest that an offer of assistance costs nothing and means a great deal under certain conditions.

MASSACHUSETTS STILL HESITATES.

The latest advices from Massachusetts indicate that the legislators are thoroughly undecided as to what they should do with the proposed radical legislation which has been laid before them. The propositions to increase the registration fees under a scheme which seems to offer no reasonable features, and to restrict the weight of motor trucks which may be allowed to operate on the public highways have failed to impress either the public or the members of the legislature as possessing sufficient merit to be enacted into law. However, there seems to be no one who has the necessary courage to settle the matter one way or another.

In the meantime, the automobile business is bound to feel the effects of the situation. This applies particularly to the sale of commercial vehicles. Many concerns which may be convinced that they should adopt the modern method of transportation are at a loss to know what to purchase, since it is possible that legislation will be passed at any moment which will make this purchase unavailable for use.

There has been a suggestion that the legislature intended to allow these matters to lie on the table until after a summer recess, or to pass them along to the next session for solution. It certainly is to be hoped that nothing of this nature will occur. Massachusetts cannot help but realize that the automobile industry has reached proportions which warrant better treatment at its hands.

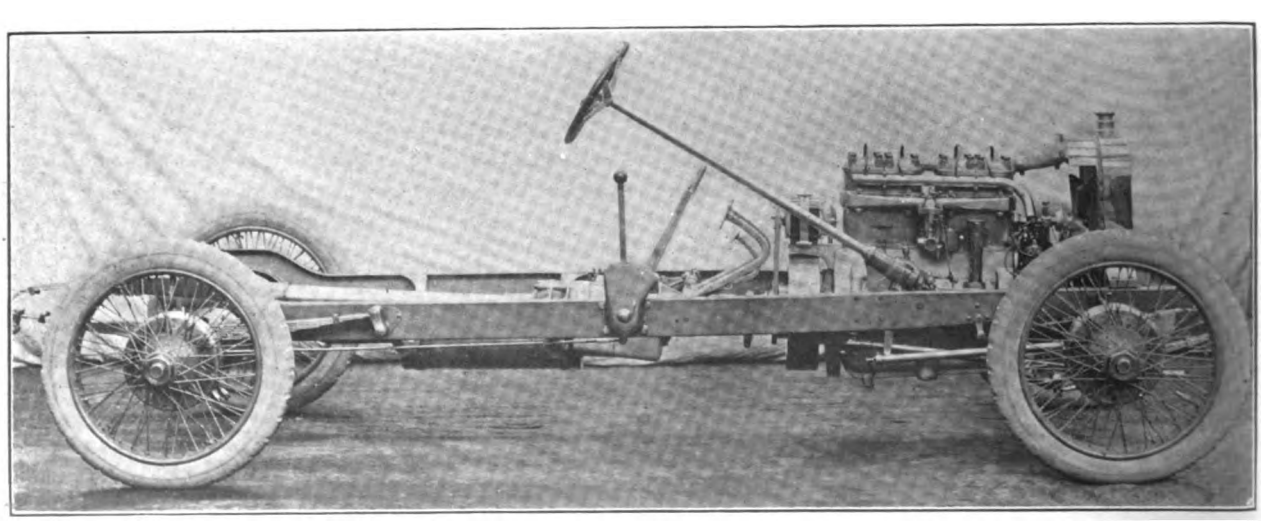
NEED FOR ROAD PATROL.

There is no gainsaying that this has been a decidedly backward spring, but those who have had occasion to utilize the roads, at least over a goodly portion of the East, are at a loss to understand why they should be in such poor condition, when so much money has been appropriated for their care and maintenance. The condition in mind is that in which numerous small holes or indentures are to be noted.

It has been suggested by those who may be presumed to be in a position to understand the need, that the establishment of a suitable road patrol early in the season would obviate the necessity for more substantial expenditures later in the year. Wherever these small holes might be found, the patrol would mark them in some manner, so that the work of repair could be accomplished with little effort and small expense. There appears to be quite as much need for wise administration of the funds now available as for increasing the fees required from motorists.

Several cities are maintaining patrols of the nature suggested, it being the practise of these men to see that the necessary minor repairs are made without delay. If municipalities are able to carry out this plan without unduly encroaching upon the appropriations for road work, it would sem that it might be extended to become a part of the state highway system.

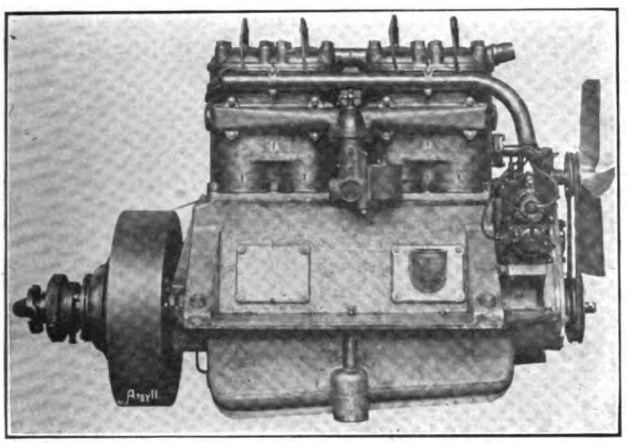
Digitized by Google



The American public is more than ordinarily interested in the latest product of Argylls, Ltd., Alexandria, Dumbartonshire, Scotland, for the reason that this employs the new Argyll single sleeve motor, which was displayed for the first time at the recent Olympia show in London. Not all of the models manufactured by this concern are thus equipped, the highly efficient poppet valve engine still being retained for several cars made by it. The design shown herewith is termed the Prince Henry in which a sleeve motor of 25 horsepower is utilized.

Accompanying illustrations present the four-cylinder engine completely assembled as well as a vertical cross section through one of these cylinders, from the latter of which the construction and action of the single sleeve may be noted. It will be seen that the crankshaft, connecting rod and piston are of the usual type, the particular features being the single sleeve valve with its specially shaped ports, the corresponding ports in the cylinder and the mechanism for operating the valve.

As is usual in four-cycle engines the sleeve is operated at half the engine speed. The valve actuating shaft B is geared to the crankshaft A by a silent chain and revolves at the same speed. On this shaft B opposite each cylinder is a small worm wheel C, which engages with a disc wheel D, revolving at half crankshaft speed. This disc wheel is carried in a phosphor bronze cage bearing and is fitted with a thrust ball bearing and oil retaining cap, the whole being easily removable.



On the face of the disc wheel at a fixed distance from the centre, a hole is bored through the body, and in this hole a pin E is free to work both in and out, as well as to revolve. It also has a flattened end which fits between the jaws at the botton end of the sleeve valve F and is held in position by a fitted bolt passing through a hole in the pin E and corresponding holes in the jaws of the sleeve F.

It will be understood that as the sleeve crank revolves the pin E carries the sleeve with it, so that the latter itself besides travelling up and down also works sidewise in one direction when the sleeve crank is working through the top half of its revolutions, and sidewise in the opposite direction during the bottom half. For example, if a fixed pencil were held against

Twenty-Five Horsepower Argyll Chassis, Fitted with Single Sleeve Motor, Brakes on All Four Wheels, Worm Drive and Demountable Wire Wheels.

Digitized by Google

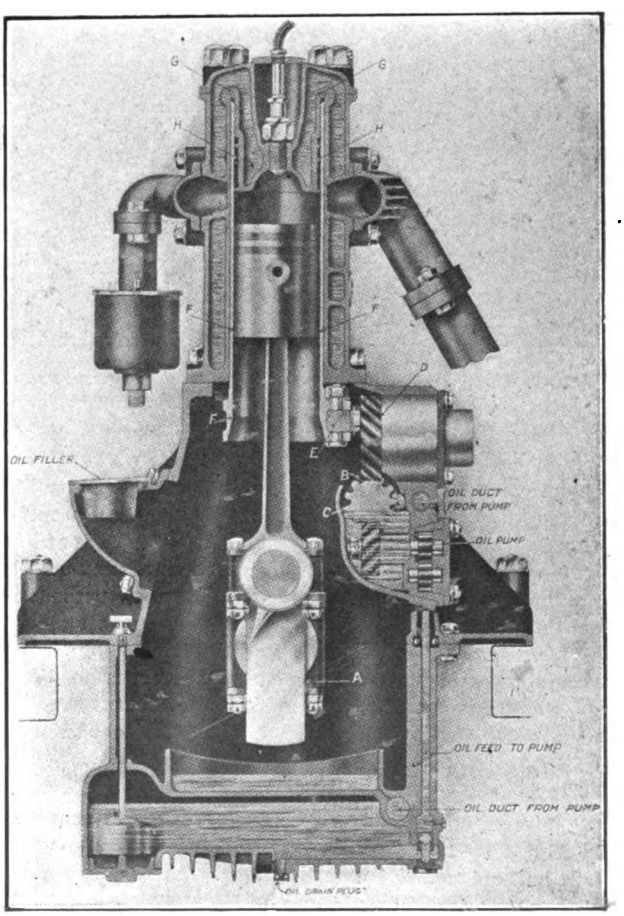
Four-Cylinder Argyll Sleeve Valve Motor Completely Assembled.

the sleeve during one revolution of the sleeve crank, it would be seen that the line so drawn would form an ellipse.

In the cylinder there are six ports, three on each side, those on one side being exhaust members and those on the other inlet. The sleeve has five ports, two being exhaust and two inlet, the odd port acting alternately for admission and exhaust. The cylinder is closed at the top end by means of the head G, which may be described as a fixed piston, having the same diameter as the motor piston and projecting into the cylinder, so that between the cylinder wall and head an annular space is formed in which the sleeve works. A broad spring ring H is fitted in the bottom end of the head.

As the piston begins to go down on the suction stroke, the inlet ports of the sleeve begin to register with those in the cylinder, following the elliptical line, until upon nearing the completion of this stroke, the bottom edges of the sleeve ports are just about to pass behind the broad ring in the cylinder head.

As the piston moves upward on the compression stroke, the sleeve also moves upward, the ports travelling well up behind the ring, until at the highest point of travel ignition takes place. During the downward movement of the piston the sleeve travels with it.



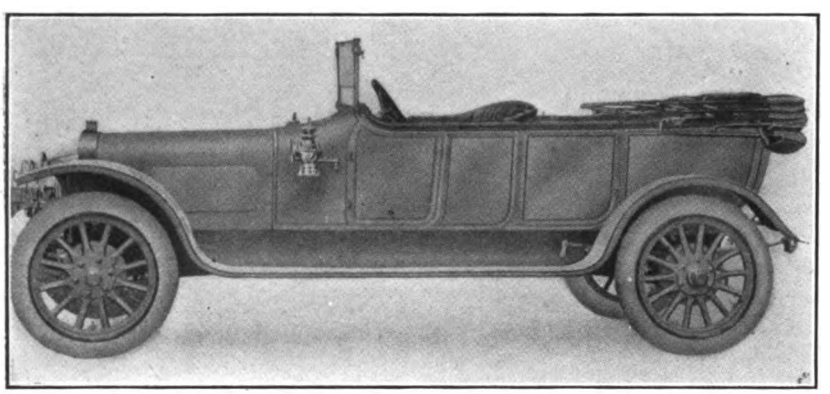
At the bottom of this stroke the exhaust ports of the sleeve have come down past the broad ring and are beginning to register with those in the cylinder. This continues throughout the exhaust stroke, until at the beginning of the suction stroke again, the exhaust ports close and the inlet ports commence to register as previously explained.

It is claimed by the maker that this twisting motion of the sleeve possesses inherent advantages. The sleeve never comes to rest, but is continually in motion in one direction. In addition it is maintained that this action provides for more efficient lubrication, spreading the oil over the entire surfaces with which the sleeve comes in contact.

A shaft running across the front of the motor and driven by a gear from the sleeve driving shaft, operates the magneto at one end and the water pump at the other. The oil pump also is driven at a right angle to this sleeve shaft. There is an oil trough under each cylinder into which the big ends dip, and after performing its functions all lubricant is filtered through a fine wire gauze before returning to the main reservoir.

The clutch is of the flat plate, multiple disc type, running in oil. The transmission provides four speeds forward and reverse. Brakes are fitted to all four wheels, these being operated either by hand lever or pedal. All act together, but compensate diagonally, thereby reducing any tendency to side slip. Springs are semi-elliptic in front and three-quarter elliptic in the rear.

The frame is of pressed steel, channel section, securely braced and gusseted where necessary, having a sub-frame riveted to the cross bar for carrying the engine and gearbox. The front axle is a drop forging. The rear member has been designed to secure absolute quietness. Final drive is by worm, on a full floating shaft, fitted throughout with ball bearings. Detachable wire wheels are standard equipment.



Sectional View of Argyll Sleeve Valve Motor, Depicting Method of Operation.

Digitized by Google

According to Consul Jose de Olivares of Madras, India, the advent of the motor vehicle in that vicinity is of comparatively recent date, but within a very brief interval it has supplanted carriages drawn by horses to a great extent. American machines have succeeded in gaining a foothold in the face of much opposition and prejudice, and it is earnestly to be hoped that manufacturers and exporters in the United States will follow up the prestige thus gained by inaugurating an aggressive campaign looking toward the eventual supremacy of the American car in Madras. The consulate is anxious to grant the fullest co-operation, and expects to receive genuine responsiveness on the part of dealers and purchasers throughout the district.

★

The ninth annual automobile and motorcycle exhibition of the Bohemian Automobile Club of Prague was held in that city in April. The Studebaker Corporation, with three cars, was the only American exhibitor, although the Ford agent secured space but was handicapped in the non-arrival of machines. It is understood that there is a splendid market in Bohemia for cars selling at from $4000 to $5000, and that if American manufacturers will take sufficient interest in the opening, it is believed they can supplant those from Italy, France, Belgium and Germany, which now control the field. European makers pay particular attention to the body work, presenting graceful lines, and taking great care in rubbing down and filling before painting. Exterior appearance seems to be considered by the Bohemians to be of greater importance than mechanical features. The next exhibition will be held during the second week in April, 1913.

Twenty-Five Horsepower Argyll Prince Henry Type Car, with Seating Capacity for Five Persons.

★

Several entries have been filed for the international Alpine tour of the Austrian Automobile Club, which will be held in July, among them being the following: Prince George, Graf; Duke of Brunswick-Luneburg, Stift; Prince Elias of Parma, Austrian Daimler; Count Alexander Kolowrat, Laurin-Klement; Count Draskovitch, Laurin-Klement. Both princes will drive their own machines. As yet, there does not appear to have been much interest awakened in the event outside of Austria, but it is anticipated that several countries will be represented, including the United States.

★

Arrangements have been completed for the annual summer visit of the Institution of Automobile Engineers in Great Britain to Paris, June 20-22. Some 75 members of the organization have signified their intention of making up the party, which will proceed in two sections, one by way of Calais and the other by way of Dieppe. The headquarters of the institution will be at the St. Lazare Terminus hotel, from which motor 'buses will convey the members of the party to the various works to be inspected, including the following: Mors, Gnome, De Dion-Bouton, Bleriot, Darracq, Gobron-Brille, Panhard, Lavasser and Deperdussin.

★

F. Leslie Bruford, secretary of the Automobile Club of Victoria, Ludstone Chambers, 352 Collins street, Melbourne, Victoria, Australia, announces plans for a motor car display in the Exhibition building at Melbourne, in the near future. Applications are now being received for show space. This notification has been made with the idea of giving American manufacturers and agents sufficient opportunity to make arrangements for being well represented. Cars produced in the United States are extremely popular in that territory, and it is hoped that full advantage will be taken of the opportunity afforded. Mr. Bruford will be glad to take up the matter with those who make application for space.

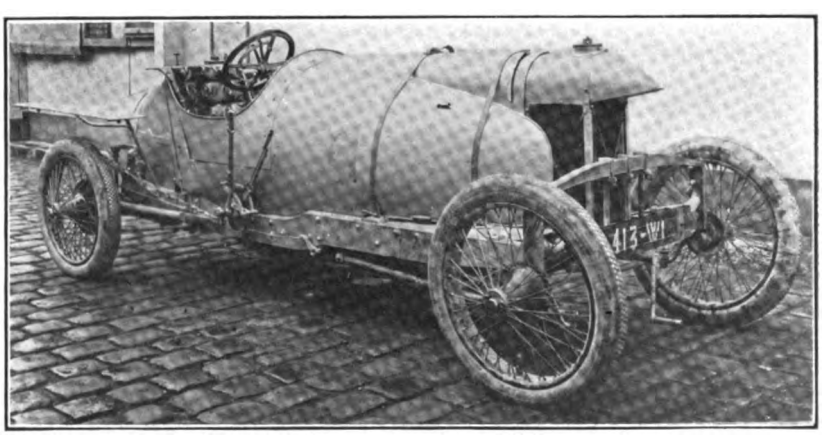
★

Royalty has given its official sanction to the Knight type of motor, several reigning sovereigns having made purchases of cars thus equipped as follows: King George of Great Britain (six), Czar Nicholas and the Empress Dowager of Russia, King Alphonse of Spain, Emperor Mushito of Japan (three), Duke of Sparta, Crown Prince of Sweden, Grand Duchess of Vladimir, Duke of Connaught and seven maharajahs of India.

Panhard & Levasser of France report an increase in production of nearly 100 per cent. for the fiscal year ending May 1. The Minerva Motor Company in Belgium says its only difficulty is in producing the cars fast enough to satisfy the demand. The English Daimler concern reports that more than 7000 Knight-Daimler cars have been sold by it.

★

An accompanying illustration presents the Sizaire-Naudin car, designed by Georges Sizaire for the



Digitized by Google

French Grand Prix over the Dieppe course in June. The machine offers a number of unusual features, the entire design and construction being with a view to reducing wind resistance to an absolute minimum. Perhaps no one detail stands forth more prominently than the novel radiator.

When seen at first glance this appears to be in two parts, the first taking the form of a reverse V, while the second is a horizontal tubular member placed across the front of the car. This latter, however, is for the purpose of cooling the lubricating oil. The reverse V construction has been carried out with the idea of collecting the rushing air and forcing it to lend its maximum aid in cooling the motor.

The water compartment is on top, extending toward a sharp point at the front, and it will be noted that the filler cap is of ample proportions. The fuel tank is located behind the seat, and this portion of the body also is of pointed design.

The front spring suspension is decidedly unique, the spring itself being carried well above the axle, and nearly midway between the top and bottom of the vertical radiator. The wind resisting fenders over the rear wheels are also worthy of note. Detachable wire wheels are employed as will be true of all French cars entered in the event, with the exception of the Delages. Similar equipment will appear on the Spanish Hispano-Suiza, German Mathias, and British Vauxhall and Calthorpe entries.

Sizaire-Naudin Entry for French Grand Prix over the Dieppe Course in June.

★

Toronto, Can., is to have a new automobile factory, a company having been organized in that city to manufacture a six-cylinder car. The new concern is to be capitalized at $200,000, and a factory will be erected at a cost of $55,000. Canadian products will be utilized exclusively with the exception of the frame, front axle and wheels. The company will consist of Norman Allen, Herbert Hall, J. S. Saunders, Walter Reeves and Peter Lawson.

INDIANA PLANS TRAVELLING SHOW.

The Indiana Automobile Manufacturers Association of Indianapolis is considering the project of a travelling automobile show of Indiana made cars. The plan, as outlined by President J. J. Cole of the Cole Motor Car Company, calls for a special railroad train carrying the exhibit of each company and show tents in which to display the cars, so that the affair takes on the aspect of a circus. It is possible that the plan may be tried out in the fall, when the 1913 models are ready.

Motorists should see that their individual states require lights on all vehicles using the highways at night.

HAVOLINE OIL PATHFINDER STARTS.

The pathfinder of the Havoline Oil Company, New York City, recently started out on a tour of the New England states and the Middle West to gather data for the second edition of the Havoline touring book. Reports are being sent daily to the Automobile Club of America as to the road conditions. It is expected that a great deal of valuable information will be collected and published in the Havoline book.

ORPHAN'S AUTOMOBILE DAY ASSOCIATION.

The annual meeting of the Orphan's Automobile Day Association of New York, Inc., was held recently and officers elected for the coming year as follows: President, Mrs. J. D. Smith; vice president, W. J. Morgan; treasurer, W. C. Poertner; secretary, A. J. Inderrieden; acting secretary, Mrs. D. C. Stidham. The annual outing of this association, when a large number of New York's orphans are taken for an automobile trip, has become one of the features of the trade at the metropolis, and is supported by private owners, dealers and manufacturers as well. Plans are being prepared for this year's event, and already a number of cars have been placed at the disposal of the association, including those of the following makes: National, International, LaFrance, Bergdoll, Pope-Hartford, Mitchell, Knox, Metallurgique, Winton, Case, Warren, Cunningham, White, Stevens-Duryea, Abbott-Detroit, Chalmers, Lozier, Oldsmobile, Havers, Oakland, Palmer-Singer and Marquette.

KEATON PLANT FOR DETROIT.

The plant of the Keaton Motor Car Company, which was recently organized by F. M. Keaton and William Houck, is to be located in Detroit, arrangements having been made to obtain a factory there. It is planned to make 1000 cars this year, based upon the Renault design.

CORRESPONDENCE WITH THE READER

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Acetylene Mixture.

(1373)—I understand from the correspondence column of your most valuable Journal that acetylene absorbed by gasoline gives a more powerful explosive mixture than gasoline alone. I would consider it a very great favor if you will inform me of a simple method of obtaining this mixture. LOUIS ENGEL, JR.

Philadelphia, Penn., May 18.

Regarding the mixing of acetylene and gasoline the article dealt with probable dangers of the two products uniting or mixing with air in a closed room, or a garage, and being ignited by a flame. A certain authority holds that such a mixture would produce a more powerful explosion than a gasoline vapor.

As far as the writer can ascertain a mixture of acetylene and gasoline is not utilized although it was stated in the article that the former could be carbureted; that is, mixed with air in a special device and transferred to the combustion chamber in the usual manner. In some self-starting devices it is claimed that the engine may be operated by the equipment until the supply from the tank becomes exhausted.

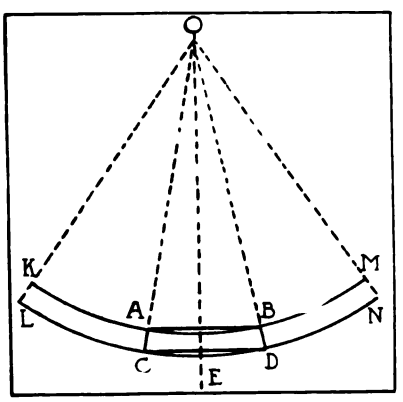

Fig. 1—Working Diagram for Cutting Lining for Cone Clutch.

The proper acetylene mixture is 10 parts of air and one of the gas. This is brought about by a mixing valve incorporated between the tank and cylinders. There are several upon the market which perform this function automatically. While by experimentation one of these members could be made it would be better to purchase one, as considerable time and expense would be saved in the installation.

Slipping Clutch.

(1374)—I have a model 38 Overland which I have operated less than 3000 miles. I cannot tighten the high speed clutch any more. It continually slips, and the pedal won't stay in high. It is the planetary type transmission. Could you inform me how to remedy it? Would it take an expert to replace a part that might be causing the trouble? GEORGE S. MARSHALL.

Basehor, Kan., May 12.

The slipping of the clutch is due to operating with the member improperly adjusted and the wear to a lack of lubricant. The best method would be to disassemble the transmission and examine each part carefully. A new plate probably will be required, but this may be determined by inspection. Unless one is familiar with the work it is best to have the repair attended to by a capable repairman. If there is an Overland agent convenient he will be able to locate the trouble and give an estimate as to the cost of the repair.

Storage Battery Plates.

(1375)—Being a subscriber of The Automobile Journal I would like to be informed regarding the Faure type of storage battery plates utilized for electric lighting of the motor car. What I wish to ascertain is whether the active material, oxide of lead, applied in a paste form is the same for both the negative and positive plates, and how these members may be distinguished.

J. WALLER.

Brooklyn, N. Y., May 14.

In the Faure or pasted type the lead plates are coated with minium or litharge made into a paste with acidulated water. When the material is dry these plates are placed in a bath of diluted sulphuric acid and subjected to the action of a current, by which the oxide on the positive plate is converted into peroxide, and that on the negative reduced to finely divided or porous lead. The positive plate may be distinguished easily by its color, being a brown or a chocolate. The negative is a light gray. Ignition batteries are not practical for electric lighting because of their low discharge rate. A lighting battery, however, may be utilized for ignition purposes.

Relining Cone Clutch.

(1376)—As a new subscriber to your valuable publition, am taking advantage of your offer, published in the last issue to aid owners in making repairs to their cars. I purchased a second hand machine and am having trouble with the cone clutch. The repairman informs me that it requires a new lining because the old one is worn out. Would like to do this work to save expense of repair bills. NEW OWNER.

Portland, Me., May 17.

The simplest way of releathering the clutch is to remove the old member and utilize it as a pattern. When this is not possible the following method may be employed: Take a large sheet of paper and draw a side elevation of the clutch cone as outlined at Fig. 1.

Digitized by Google

A, B, C, D. Produce the lines A—C and B—D, until they meet at the point O. Next draw the centre line O—E. With the centre O and radius O—C, describe an arc L—N, and with radius O—A, describe another arc K—M.

Next, measure the largest circumference of the cone. For example: Suppose the circumference of the cone to be 60 inches. On a pair of dividers take a distance a small fraction of this, say one inch. From the point E where O—E cuts the larger arc, lay off round the arc this dimension 30 times in the same direction. This will give the point L. With the centre E and radius E—L mark off the point N. Join L and N to centre O. Then K, L, M, N will be a figure the same shape and dimensions as to be cut. Cut out of the paper the figure K, L, M, N, and use as a pattern from which to cut the leather. This pattern can then be marked and utilized when necessary in the future.

The clutch leather should be left about .25 inch short and the two ends riveted to the cone first so that they butt against each other. The leather is then soaked with hot water and stretched onto the cone, in much the same manner as a pneumatic tire is fitted to a rim. As the leather dries it will shrink tightly into its place. It is then secured by copper rivets, care being taken to see that the heads are well below the surface of the leather. The cone is next mounted on a lathe and the material trued up. In fitting the leather it is best to mount it with the shiny side of the material next to the cone.

After the clutch has been replaced it should be soaked liberally in oil and during the first 50 or 100 miles be well lubricated. It is essential that the leather be kept soft and pliable as when it becomes hard it is apt to burn or char when slipping.

Vibrator Inoperative.

(1377)—What is the cause of failure to start from the switch of a Bosch type of dash coil such as employed on the Marion car? I can start on the batteries by cranking, but when I push down the button on top of coil there is no buzz and the motor won't start. A set of batteries lasts but a short time. Was informed by a repairman that the coil was short circuited and was advised to ship it to the Bosch company for repairs.

A READER.

Providence, R. I., May 11.

It is evident that a short circuit exists. The best plan would be to remove the coil, an operation accomplished by unscrewing the cap, which will permit the withdrawal of the coil proper, and send it to the maker. The Bosch Magneto Company maintains a service station at Boston near the Motor Mart. Perhaps it would be advisable to drive the car to Boston and have the ignition system inspected thoroughly.

Water in Acetylene Pipes.

(1378)—Am driving a model T Ford and operate a good deal at night. The gas lamps give me considerable trouble, and although I blow out the pipes and clean the burners, they do not stay clear. Is there any way the trouble can be cured, or will a new generator be necessary?

FORD.

Topeka, Kan., May 12.

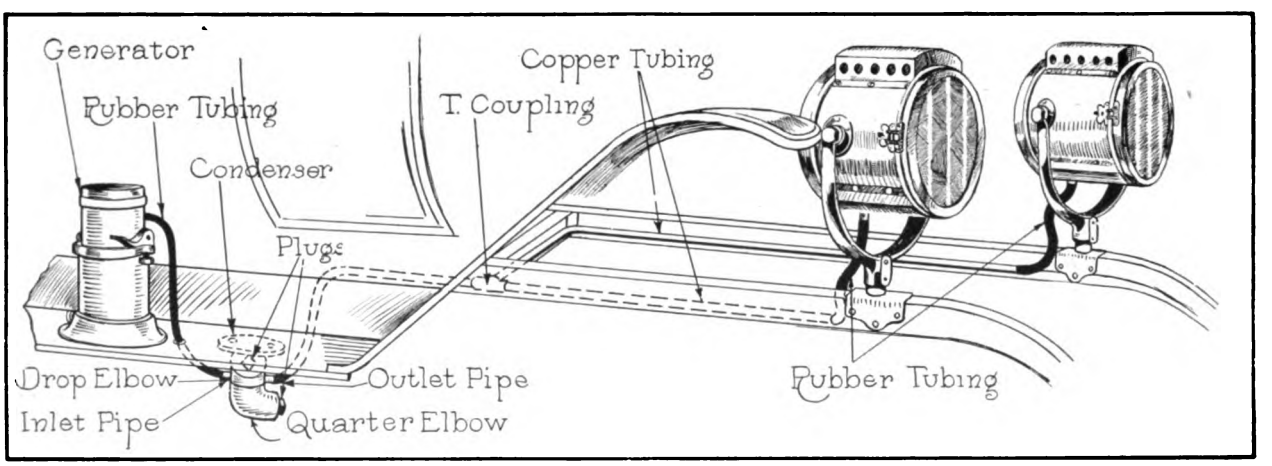

Fig. 2—Inexpensive Device for Catching Moisture in Piping of Acetylene Lighting System Utilizing a Generator.

To ascertain if the fault be that of the generator, examine the deposit in the bottom of the vessel and if it be dry it denotes that the device is operating properly. If the material be wet or soggy, and the lights continue to burn for some time after the generator is shut off, it shows that the latter is not working properly and that the water is not feeding as it should to the carbide.

In the case referred to the trouble is more apt to be due to the presence of moisture in the tubing because of condensation. This usually occurs in the first 12 inches or so after the gas leaves the generator and consequently the pipe and rubber connections should slope directly downward to the lowest point in the system and continue a foot or more in order to drain any possible moisture toward the generator instead of in the direction of the lamps.

At Fig. 2 is reproduced a drawing from the Aug. 26 issue of The Automobile Journal, which illustrates a method of incorporating a water trap for retaining any moisture that may be present in the system. It is constructed easily and is inexpensive as the material

Digitized by Google

may be procured readily from almost any plumber.

It consists of a drop elbow with a male thread, quarter-elbow and two plugs. The drop member has a flat flange perforated for screws and is attached under the running board as shown in the drawing. The quarter-elbow is screwed to this and plugs utilized to close the openings. The former is tapped and threaded to take a connector and a .25-inch copper tubing to which is attached the pipes leading from the generator to the trap, and thence to the lamps. All moisture will collect in the trap and can be removed easily by unscrewing the lower plug. A petcock may be installed if desired, in place of the plug member. As the trap will hold considerable water, and will require emptying occasionally, the device will answer all purposes as well as being cheaper than ready made water traps. The method of installation is also suggested in the diagram.

Stress and Strain.

(1379)—Am a reader of your magazine and notice the reference to torsional and tensional strains and stresses, and that a certain part is made to take care of these. Will you kindly explain what is meant by the terms?

INFORMATION.

Cisco, Tex., May 19.

There is some difference of opinion among writers as to the definition of these terms. An external force applied to a body, so as to pull it apart, is resisted by an internal force, or resistance, and the action of these forces causes a displacement of the molecules, or deformation. Some writers call this a stress, and the internal force a strain. Others hold a reverse opinion. Some authorities never use the word "strain" in their writings to avoid confusion.

Merriman states: "A stress is a force which acts in the interior of a body, and resists the external forces which tend to change its shape. A deformation is the amount of change of shape of a body caused by the stress. The word 'strain' is often used as synonymous with stress and sometimes it is also used to denote deformation."

Stresses are of different kinds such as tensile, compressive, transverse, torsional and shearing. A tensile stress or pull, is a force tending to elongate a piece. A compressive stress or push is a force tending to shorten it. A transverse stress tends to bend it. A torsional stress tends to twist it. A shearing stress tends to force one part of it to slide over the adjacent part. Tensile, compressive and shearing are called simple stresses. Transverse stress is compounded of tensile and compressive stresses, and torsional of tensile and shearing. To these five varieties might be added tearing stress, which is either tensile or shearing, but in which the resistance of different portions of the material are brought into play in detail, or one after the other, instead of simultaneously, as in the simple stresses.

Lengthening Valve Stems.

(1380)—I read in a motor publication that valve stems which had become worn and were not adjustable could be lengthened by placing on an anvil and hammering. I understand the ends are hardened and if the temper is drawn for drawing won't the metal have to be rehardened? L. E. MOWRY.

St. Albans, Vt.

The ends of the stems are hardened and if the temper be drawn will have to be retempered. In drawing a valve stem care should be exercised not to bend it and the drawing should be at a point above the cotter pin hole and not at that portion that enters into the tappet member. While the writer has lengthened these members requiring but a slight increase, it is advisable to have it done by a blacksmith or some one familiar with the work.

Phosphor Bronze.

(1381)—What is the difference between phosphor bronze and any other bronze? INQUISITIVE.

Hannibal, Mo., May 18.

Bronze is an alloy of copper and tin with small proportions of other elements. In the year 1868, Montefiore & Kunzel of Liege, Belgium, found by adding small proportions of phosphorus or "phosphoret of tin or copper" to copper that the oxides of that metal, nearly always present as an impurity in more or less quantity, were deoxidized and the copper much improved in strength and ductility, the grain of the fracture became much finer, the color brighter, and a greater fluidity was attained. The different bronzes are produced by combining different alloys such as silicon, aluminum, etc.

Timing the Spark.

(1382)—I have an 1908 Oldsmobile roadster with a storage battery, coil and timer for ignition. The motor will not throttle down and I have closed the carburetor throttle as much as possible but it does not improve it as I wish. I cannot advance the spark very far without the engine knocking. Sometimes with the spark advanced a trifle I get a kick from the starting handle when cranking slowly. What is the cause? L. L. M.

Deming, N. Mex., May 10.

The ignition timing is too early; that is, the spark takes place before the piston comes to the top of the compression stroke. This accounts for the motor racing. It is easily remedied. Loosen locking nut or binding screw of commutator or timer on shaft and move arm with roller contact block back; that is, in a reverse direction to that in which it rotates when the motor is running. Try about a .25 inch, relock nut and start motor. If the latter does not throttle enough, set the roller back a slight distance and repeat until the desired speed is accomplished. This lateness of spark will be offset when the motor is running by the amount of the advance of the spark lever.

The Parrish Manufacturing Company, which has been manufacturing car frames in Reading, Penn., is to erect a plant in Detroit. A site has been secured and plans are under way for the factory, which is to be one of the largest of its kind in the country. Frames will be produced here for the Middle West trade, while the Reading plant will continue to supply eastern makers.

SCHOOL GIRL NEW ENGLAND BABCOCK AGENT.

FEW women engage in the sale of motor vehicles as a business. There are many obvious reasons why this is so. First of all the average woman has no business training and intuition is not a substitute for the clear reasoning that is necessary in competition. Technical and mechanical education and practise is entirely foreign to woman and it is rare that one acquires either. Besides this the work of demonstrating, maintenance and care is regarded as an occupation for which only a man is fitted, while salesmanship is not often experienced by the fair sex.

Miss Virginia E. Aiken, a 16-year-old miss of Brookline, Mass., has demonstrated there is exception to the rule, for she has achieved a success as a business woman that is nothing short of remarkable for one so young. Not only is she agent for a car, but she is the New England representative of the Babcock Electric Carriage Company, Buffalo, N. Y., and as such she is entitled to do business in any of six states included in her territory. Until six months ago she had had no business experience. She was attending the Runkle school without any special purpose in mind other than to obtain a good general education.

Miss Aiken is a niece of Day Baker, New England representative of the General Vehicle Company, and for four years or more has driven electric carriages about, becoming one of the most expert of drivers. She secured a license to drive several years ago and has driven many thousands of miles, principally with electrics. One vehicle she drives is a Columbus and the other is the Babcock runabout in which she is shown in the accompanying illustration.

Now, Miss Aiken is practical and she began to study the electric carriage with keen enthusiasm. Instead of merely giving attention to the maintenance and care she went back to rudiments and systematically acquired knowledge concerning the battery and the motor. She studied electrical subjects carefully and mastered each with its particular reference to the vehicles. She was fortunate in having her uncle as an adviser and under his direction she was able to apply her knowledge to good advantage.

Constantly using the electric machines she met with all conditions that might be encountered and it was with extreme satisfaction that she solved all problems and successfully met every situation. The girl did not hesitate to work about the cars whenever necessary. She found delight in mechanical work and did it surprisingly well.

The time came when the head of the Babcock company reached Boston with the intention of discontinuing the agency because of the apparent absence of interest in electric cars He met Miss Aiken and during a conversation his purpose was told. "I'm so sorry," said she, "for I know I could sell some cars for you."

"Why don't you take it?" Mr. Babcock asked her.

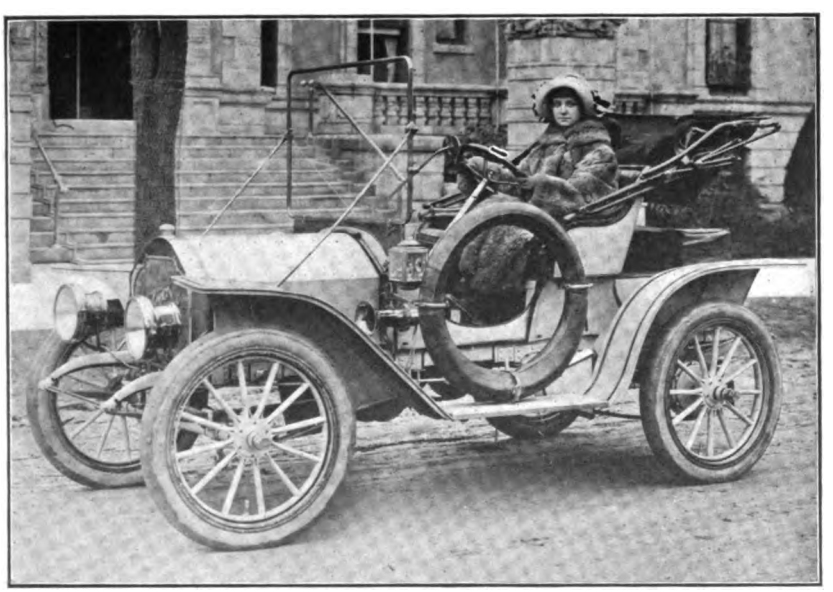
It was a strange proposition, to be sure, and then Miss Aiken though of her resources, for unlike the majority of girls she had a bank account that represented a great deal to her.

She knew that she would have to carry several machines in stock and be prepared to give service to all owners of Babcock cars, and how to plan a business that would be a success was something for which she was not prepared. But Mr. Babcock urged her to accept. When he found that she would require her capital to conduct her business he made a suggestion that was accepted and in a comparatively short time, a few hours, in fact, she was the New England agent for the cars.

Miss Aiken was a school girl and she did not care to abandon her education, but she proposed to make that agency a success. She immediately secured an office in a Brookline garage, engaged a girl stenographer and bookkeeper, and began a campaign. Then the cars arrived and all of the time that she had was given over to visiting prospects and demonstrating. Next she began to advertise and made it known that she was a business woman. When she sold her first machine she laid aside half the profits to advertising, and this, and her energetic work, brought to her other customers.

Miss Virginia E. Aiken, Babcock Electric Agent.

During the winter she was a very busy young woman. She was an exhibitor at the automobile show in Brockton, Mass., where she showed a runabout as a demonstrator, and at the Boston automobile show she worked days and evenings showing three different types of cars and gave frequent demonstrations. She and her assistant were the busiest of those making display, for many were attracted by their energy and interest.



Some of those familiar with electric vehicles were inclined to regard Miss Aiken's agency rather lightly and a number of them questioned her to learn, very

Digitized by Google

much to their surprise, that she was equally or even better informed than they, and there was no doubt of the conservatism of her statements. The sincerity and earnestness of the young woman impelled their admiration and she had innumerable visitors who learned of the practical value of the electrical vehicle in a practical talk with a very practical and business-like girl.

The result of the show has been a very busy season for Miss Aiken. She now has four cars always in stock and she is prepared to make deliveries without delay. She has systematized her business, keeps files of all her advertising and her press notices, and outside of her office work she is prepared to give all her customers and car owners the best of attention.

Miss Aiken is tall, slender and decidedly girlish, modest and refined in her manner and speech, but she has acquired a deal of selling knowledge and can demonstrate her cars with the skill and assurance of the expert salesman. She has been successful from the first and it seems probable that she will meet with a larger measure of success as her experience is broadened.

Miss Aiken at the Wheel of Her Babcock Electric Demonstrating Car.

CANADIAN BODY COMPANY.

The Fisher Body Company, Ltd., has been organized in Canada and will manufacture automobile bodies of aluminum, steel and wood. The new concern is capitalized at $150,000, and has purchased a plot of ground in Walkerville, Ont., on which will be built a plant which will have a capacity of upwards of 100 bodies a day. The incorporators are F. J. Fisher, L. Mendelssohn and A. Mendelssohn, who constitute the Fisher Body Company and the Fisher Closed Body Company, both of Detroit.

CARBO-LIGHT TANKS POPULAR.

The Carbo-Light tank is proving quite popular with motorists, so much so that the maker, the Carbo-Light Company, Anderson, Ind., has found its manufacturing facilities inadequate. This has necessitated placing an order with the Shenango Manufacturing Company, Pittsburg, Penn., for the manufacture of 60,000 tanks of various sizes, on which delivery is expected to begin in a short time, relieving the situation at the Anderson plant. The general offices of the company are to be located at Pittsburg, although the western selling branch is to remain in Anderson.

OPENINGS FOR AUTOMOBILES.

The following openings for the sale of automobiles are reported by United States consuls whose addresses and full information concerning the opening may be obtained on application to the bureau of manufactures, Department of Commerce and Labor, Washington, D. C., giving the number.

No. 8766. A government official in a foreign country has informed an American consulate that he desires to receive particulars concerning motor cars suitable for the tropics. He particularly desires information regarding medium priced cars. Correspondence with this official may be in English.

No. 8769. An American consular officer requests catalogues from the manufacturers in the United States of the very finest motor cars. These catalogues should show details of the cars, especially the interior upholstering and fittings. A car was recently purchased by a resident of his district for $8000, and at the present time it is the best machine in the market, but other residents are desirous of securing a better car, and American manufacturers should take advantage of this opportunity. The price of the car will be no object.

PRESIDENT OF 50,000-MILE CLUB.

The first president of the Maxwell 50,000-mile club is Lee Meriwether, a noted author and tourist, who has driven Maxwell cars more than 100,000 miles. He was the first motorist to qualify for one of the gold medals which the Maxwell-Briscoe Motor Company is presenting owners who have covered 50,000 miles, and it is reported that a large number of drivers have followed his example, and that several high mileages have been reported, showing that the automobile is an exceedingly popular means of long distance travel.

The opening of the first international aerial craft show in the Grand Central Palace, New York City, May 9, was accompanied by official recognition on the part of the United States Navy. Rear Admiral Hugo Osterhaus in command of the fleet then at anchor in the Hudson river, was invited to a banquet given in his honor at the rooms of the Aero Club of America by President R. J. Collier of the club, the invitation being delivered in person by Mr. Collier, utilizing a Burgess hydraeroplane driven by Walter Brookins. The successful outcome of this feature was sent from the United States cruiser Washington, Admiral Osterhaus' flagship, by wireless to a station fitted up on an aeroplane in the exhibition hall, creating a decidedly profound impression.

Concerning the show itself: Undoubtedly the most interesting machine on exhibit, largely because it was the first aeroplane constructed to specifications furnished by the United States government, was the new war biplane made by the Burgess Co. & Curtis, Marblehead, Mass. In many respects this is decidedly different from any machine previously produced in America.

Although built under the Wright patents, the new Burgess-Curtis biplane bears little resemblance to Wright craft. But one propeller is employed and this is located in front. The fuselage is entirely enclosed in an aluminum casing and is of the so-called monoplane design. The motor is a 70 horsepower Renault, located in front, above the fuel and oil tanks. The seats for pilot and passenger are arranged tandem fashion, and all controls, save those for wing warping, are enclosed.

The spread of the main planes is 43 feet, and the width five feet nine inches. These are so designed that the spread may be reduced to 34 feet six inches. It follows that the wing construction is in sections, the wiring of which is so arranged as to make dismantling a simple and easy matter. When fully rigged the machine has a total supporting surface of 450 square feet. The monoplane tail is similar to that of the Nieuport monoplane. The landing chassis is of particularly rugged construction, and is strongly braced with diagonal wooden struts.

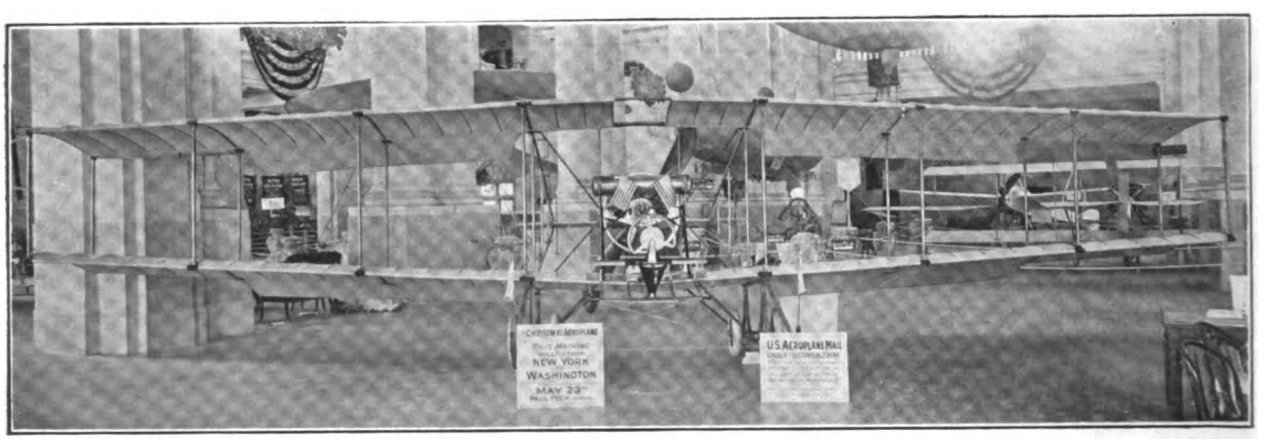
The latest type of Wright biplane also was shown, although the model presented did not include the new stabilizing device. The one conspicuous change over the 1911 design was the placing of triangular stabilizing fins at the end of an outrigger extending forward about 10 feet from the front and centre of the main planes, instead of on struts leading from the forward

General View of International Aircraft Exhibition in Grand Central Palace, New York City, with Latest Wright Biplane in Foreground.

Digitized by Google

end of the skids. The radiator has been moved to the rear and the fuel tank has been placed at the rear of one of the seats, giving a clear view ahead. The horizontal rudder at the rear has been increased to about 14 feet, and the dual control has been improved so that each operator is provided with a right hand lever.

Considerable interest was manifest in the Curtiss hydaeroplane purchased by the Russian Navy, which was shown for the first time at an organized display. Its details do not differ from the regulation Curtiss land and water machine, however.



The largest craft on display was the Jacobs-Emerson multiplane, with 724 square feet of supporting surface and weighing something like 2000 pounds. It has proven its title to being a practical machine by making a flight at an altitude of 180 feet at Atchison, Kan. The motive power is supplied by two 35 horsepower engines.

David Palmgren exhibited a monoplane fitted with two 50 horsepower motors and two propellers. This is constructed of steel tubing and covered with aluminum. Among other features, it is equipped with a self-starting device, and folding wings. It is supposed to be capable of carrying 12 persons.

J. Edson Gallaudet presented a monoplane, in which the entire front, with the exception of the lower portion of the landing chassis, is enclosed with sheet aluminum. A single skid protects the rudder in the rear, the tail carrying out the resemblance to a fish.

The Max Ams hydraeroplane, built in Mt. Vernon, N. Y., is a big three-seated biplane of 50-foot wing spread above and 36 below, the design in other particulars being somewhat upon the order of the Curtiss. The pontoons are two in number and are not unlike the Burgess-Wright, while the rudder resembles the Wright.

An accompanying illustration presents the Christmas biplane, made by the Washington Aeroplane Company, Washington, D. C., with which Paul Peck was scheduled to deliver the mail between New York City and Washington, May 22, as it was seen during the show in the former city earlier in the month. Postmaster-General Hitchcock has created a new route, known as No. 607,002, for this purpose and Peck has been sworn in as an official mail carrier without compensation by the government. The machine is equipped with a 50 horsepower Gyro motor, also a Washington product.

Christmas Biplane, Utilized by Paul Peck in Carrying the Mail between New York and Washington, on Display at the Show.

Rules to govern the competition for the Clarence H. Mackay army aviation trophy, have been formulated, making the following provisions: A column of troops will move along a road or roads unknown to the competitors, who will proceed to locate the column and report to the commanding officer. The trials are to take place in September or October of the present year. Points will be gained as follows:

Accuracy in locating on a map the position of the main column, 50; accuracy with which the strength of the body is determined, 50; accuracy and brevity of writing report, 50; best time, 50; maintaining an average altitude of 1500 feet, 50; accuracy in alighting at starting point, 50. Any competitor who drops below 1000 feet loses the contest, except that he shall not be debarred from making another trial, on the ground that to fly at a lower altitude than 1000 feet would prove suicidal in actual warfare. Full details will be made public later.

A new air danger is revealed in the statement of Mrs. Calbraith P. Rodgers, widow of the well known transcontinental aviator who met death in flight near Los Angeles, Cal., some two months ago, that the dead body of a sea gull was found wedged in the rudder of his machine sometime later. This report is verified by Frank Shafer, mechanician for Rodgers. Parmalee was flying near the same city May 14, when his machine suddenly dropped like a plummet some 500 feet

Digitized by Google

before he could right it, because of a collision with one of these gulls.

Moreau of France claims to have secured automatic stability, with a machine in which he has been making test flights near Paris. According to the dispatches Moreau was able to take photographs, utilizing both hands and allowing the aeroplane to take care of itself. He also asserts that during one of his flights he covered a distance of 30 miles without touching the levers except when turning, rising, descending and alighting.

The Aerial Navigation Company has been organized in England for the purpose of maintaining an aeroplane ferry across the English channel. Several large biplanes, capable of carrying four passengers each, are to be employed in carrying those who desire to make the journey.

The Aero Club of France has arranged a Grand Prix d' Aviation for June 16-17, in which the contestants will be required to cover a course bounded by Angers, Cholet, Saumur and Angers, seven times, making a total of 682 miles, in two days. The event is open only to French aviators, utilizing French machines. Prizes aggregating $20,000 are offered.

In order to honor the memory of Samuel Pierpont Langley, the first to construct a successful mechanical flying machine, utilizing a steam engine, the Aero Club of Washington, D. C., has decided to celebrate Langley day each May 6. Langley's first successful demonstration was made May 6, 1896. This year an aviators' field day was held at the Chevy Chase Club grounds in that city.

Following the announcement that two Japanese had received pilot's licenses from the Aero Club of America in the Curtiss flying school in California, comes the information that W. B. Atwater of New York is in Yokohama for the purpose of demonstrating a Curtiss hydraeroplane to the Japanese navy officials.

The committee in charge of the German national aviation fund, created for the purpose of presenting a fleet of aeroplanes to the Kaiser, already has secured $500,000 of the necessary $750,000. Germany now has 50 military aeroplanes, besides the largest fleet of war dirigibles in the world. The government will expend $1,500,000 in acquiring aeroplanes during the coming year, and the fund is being raised for the purpose of bringing the total equipment in excess of that possessed by France.

John F. McGee of Pawtucket, R. I., who has been interested in aviation for a number of years, having produced a model Bleriot monoplane with more or less success, has decided to become a recognized pilot. He has signed a contract with Harry Atwood, and will fly a Wright biplane with the company represented by Atwood until Jan. 1, at least. He hopes to make a cross country flight from Boston to Providence early in June.

McGee has been driving and working upon automobiles for the past eight years and is thoroughly familiar with the internal combustion motor. During the international meet at Belmont Park in 1910, he was employed by J. C. McCoy, vice president of the Aero Club of America, and in that position had access to the hangars throughout the meet. He associated himself with the late John Moisant, and became particularly interested in the Bleriot monoplane used by that aviator.

Later he began the study of the Wright and Burgess-Wright biplanes and is now well versed in their construction and method of operation. Atwood considers him a decidedly apt pupil and has promised to place a machine at his disposal as soon as he has made the necessary flights.

After being postponed a number of times the first trials in the bomb dropping contest, for which a Michelin prize of $10,000 has been offered, were held near Paris early in the month. Although four competitors were scheduled to appear for the test, but two were present, these being Lieut. Bosquet in an Henri Farman biplane with 50 horsepower Gnome motor, and Lieut. Maillefert in a larger machine of the same make with 100 horsepower Gnome. The final competition closes Aug. 15. One American aviator, Lieut. Scott, U. S. A., is entered.

Flying a Wright biplane high over the battleships and forts in and around Boston harbor, May 20, Arch Freeman dropped "bombs" on the decks of the Rhode Island and New Jersey, and into Forts Banks and Heath, and the Charlestown navy yard. In each of these was a note reading: "What if this bomb were 16 ounces of nitroglycerine instead of flour?" It was without doubt the most convincing argument the United States army and navy have yet had of the practicability of the aeroplane in time of war. Some of the bombs were dropped from an altitude of only 500 feet, which is considered by army officials to be suicidal under active conditions. Others reached their targets from a height of 1500 feet.

King George V of Great Britain and officials of the British Admiralty were treated to an exhibition of the hydraeroplane in flight over the fleet at Weymouth, England, May 18, when Horace Short tried out his new craft before the King. The machine was virtually a Short biplane to which pontoons had been fitted, but it was the first time the British men-of-war had had opportunity to witness the possibilities of this newest craft in action.

ANNEALING SPINDLE PINS.

In replacing worn spindle pins with new members a repairman noticed that the threads of the part broke away at the slightest contact. A further examination of the bolt revealed the fact that the threaded end had been tempered too hard. Had the pin been utilized an accident might have ensued. The bearing portions of the pin were wrapped with a wet cloth and the temper drawn from the threaded end, and when replaced in the spindle gave efficient service. When these members have the appearance of being too highly tempered on the threaded end, they should be tested and the metal annealed.

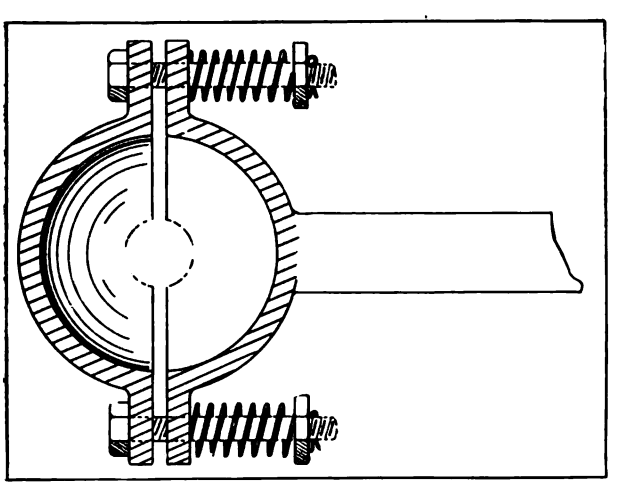

Fig. 1—Simple Method of Fitting Springs to Ball Socket Joints of Steering System.

SPRING STEERING CONNECTIONS.

While provision is made in the modern car for the absorption of road shocks to the steering system, many of the older types are not thus equipped. A method of fitting a spring device to the reach rod connections as well as those connecting the steering mechanism was noted by the writer recently. The car was an old model and the steering connections were of the ball and socket type as outlined at Fig. 1. Considerable play existed which wear was taken out, and as the owner complained of these parts rattling the repairman devised the kink outlined in the drawing.

The screw bolt holes in the half to which is attached the rod, were enlarged slightly to remove the thread and a new bolt fitted, one having the thread cut up about half way from its end to the socket member. A stiff spring was placed over the bolt and a nut screwed on and up to obtain the desired tension. Cotter pin holes were then drilled and retaining members fitted as depicted in the drawing. The job was not expensive and reduced road shocks to a minimum as well as eliminated rattle.

CRACKED WATER JACKETS.

The following method for repairing cracked water jackets is given in the Autocar. Open the crack in the jacket to a V shape without increasing the opening on the inner side, then smooth the edges and deposit on them any of the preparations sold for silver plating. The material will readily adhere to the smooth surfaces and the repair will not only endure but will be unnoticeable.

WHEN A MUFFLER INCREASES POWER.

That a muffler may increase the power of a motor instead of decreasing it may seem paradoxial and utterly impossible, but such has proved to be the case. Occasionally two-cycle motors are found which are faster and give more power when muffled than when the cut-out is opened. The explanation is that the muffler and manifold are of such shape that the gases are set into vibration as in an organ pipe and so flow more quickly, clearing the cylinder better than when the muffler is not utilized and the motor exhausts directly into the open air.

Digitized by Google

SMALL HEAVY FUEL CARBURETOR.

In view of the fact that the internal combustion engine is being used more extensively, and that the number of mechanically propelled vehicles is increasing rapidly, the demand for gasoline is assuming large proportions. Already the problem of utilizing heavy fuels such as kerosene is being given serious consideration and there are a number of devices for the evaporization of this fuel applicable to the hydrocarbon motor.

This subject is being given more attention abroad perhaps than in this country, and it is interesting to note that a German named Durr has been experimenting for some time with a design which is said to fulfill all expectations. A striking feature of the carburetor is its size, that for a 15 horsepower engine being but 2.75 inches high and 1.875 inches in diameter. That it is compact and simple will be noted by the accompanying illustrations, that at Fig. 3 being an exterior view.

Another interesting feature is that it is floatless, fuel being supplied to the bottom of a circular casing by pressure from the fuel container, but the amount is controlled by means of a needle valve operated by suction. It is claimed that the weight of the needle and its component valve when at rest suffices to prevent the flow of fuel.

The needle is acted upon directly by the partial vacuum in the intake pipe which is in direct communication with the top of the fuel control valve. The latter is integral with the needle valve itself, and its periphery is a working fit inside the casing. The needle is drilled with a duct for the liquid fuel, which is drawn up when this is raised from its seat.

By referring to Fig. 2 it will be seen that air enters the bottom of the casing under the fuel control valve and thence is drawn through suitable small openings at high velocity into the top of the fuel outlet, the needle performing most of the functions of the usual jet. The desired atomization is actually secured at the coned top, this being brought about by the meeting of separate streams of air and fuel moving through their respective apertures at high velocity.

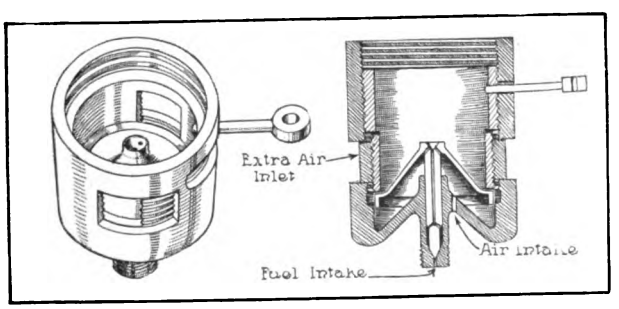

Fig. 2—Showing Top of Atomizer and Fuel Control Valve of Durr Heavy Fuel Carburetor.

To provide for the variable speed of the internal combustion motor the designer has fitted an auxiliary air member. This is neatly combined with an arrangement for positively limiting the lift of the fuel control valve. An inner sleeve, screwed internally to rotate in the threaded interior of the casing, covers

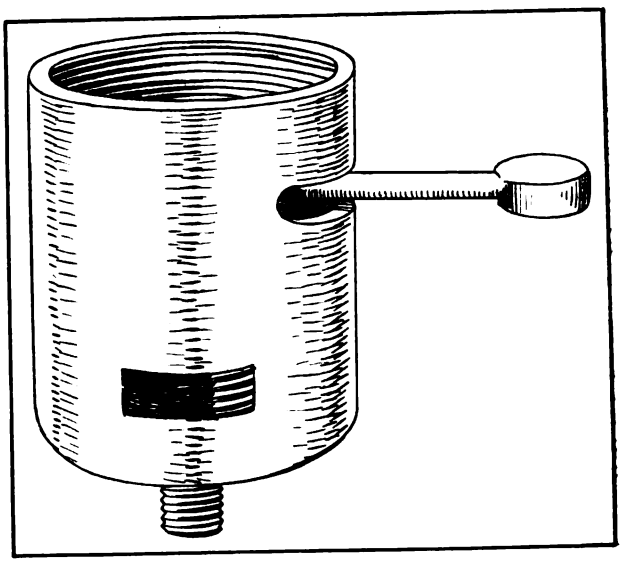

Fig. 3—The Durr Carburetor, Noticeable for Its Smallness and Absence of the Usual Float.

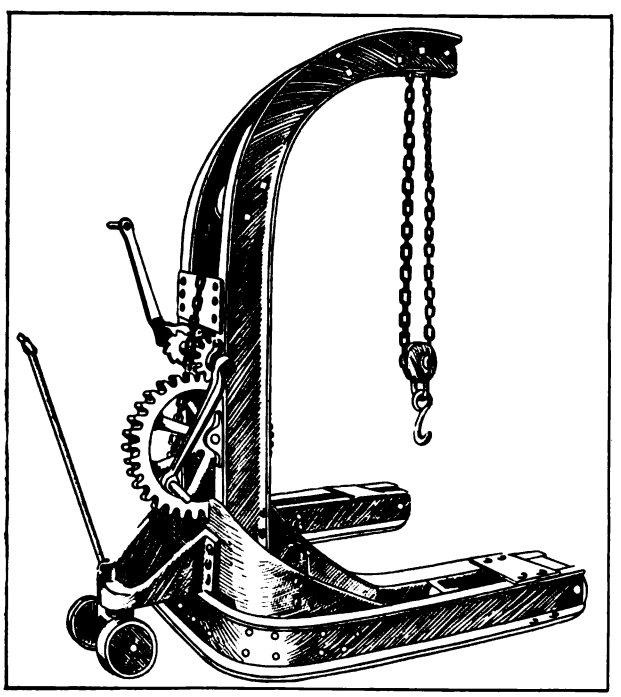
and uncovers a port to the outside air, thus regulating the amount of atmosphere that may be drawn in with the already aerated fuel.

When this sleeve rises or falls, as the case may be, its bottom end being of such a diameter as to serve as a stop to the fuel control valve, and to the lift of the needle, the supply of pure fuel is correspondingly regulated. As additional air is admitted, the range of lift for the needle is increased. When the suction on the jet itself becomes reduced, the fuel supply capacity is increased.

Comparative tests on a car with a 50 horsepower motor developed the fact that with gasoline and the usual carburetor the engine yielded 62 horsepower, brake test, and utilized 9.87 ounces of fuel. A Durr carburetor under similar conditions gave 71.9 horsepower and used 7.85 ounces of heavy fuel. The features claimed of the Durr carburetor include more power, lower consumption of fuel and economy.

NEED OF PROPER EQUIPMENT.



The quality of work turned out by a garage is dependent upon the machine and tool equipment of the repair shop no less than upon the ability of the repairmen. While some men, given a hammer and a wrench, and with a lathe at their disposal, can make almost any repair that comes into the shop, they are rare, and work performed under such conditions is bound to result less favorably than when ample facilities are provided.

Today, when automobilists are demanding more accurate and exact work from the garage, and are bringing in jobs that were formerly considered hope-

Digitized by Google

less and beyond repair, the repair shop must be thoroughly equipped to do all kinds of machine work if it is to secure and retain trade. It is the garage with the best equipment that gets the big jobs.

If a man has a job of welding, and the garage where he has been buying his gasoline has no welding outfit, he may be expected to hunt up a place where he can get the work done. As a result, the first shop not only loses the profit on that particular piece of work but places itself in a position to lose the man permanently. It is not good business policy, other things being equal, to turn any work away as the customer may find some other establishment which can and will do all his work. It is because of the necessity for keeping old customers, as well as obtaining new ones, that the outlay for modern machine equipment should be given proper consideration.

LaFayette Portable Crane.

When viewed from the standpoint of first cost, many men think that the expense of some machines is too great, and that the automobile trade of the vicinity will not be sufficient in the particular line of work which the machines perform to warrant the expenditure. This is often, in fact usually, a mistaken idea, and the garage proprietor has not seen the full field from which he may draw custom. There is no especial reason why a drill press in a garage should work on automobiles only, except that the owner does not go out after any other class of work.

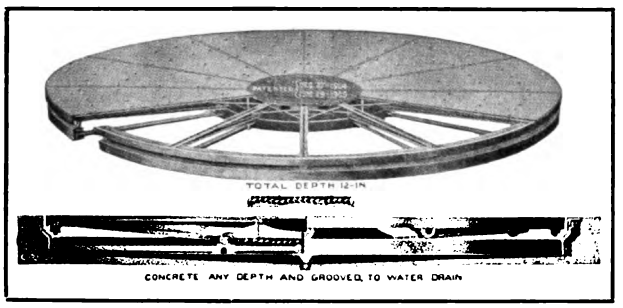
A garage with a good machine equipment is fitted to do all the work of the modern machine shop, just as the latter can make automobile repairs with great facility. Many a machine shop has found in this class of work a decided addition to its trade, and a few garages are beginning to realize that with a good machine equipment they may find in the usual machine shop work an excellent source of income during the dull months.

Portable Crane.

Outside of a lathe, perhaps the most useful device a garage can have is a portable crane. Not only does it save the time and strength of repairmen but it makes possible work that could not be performed by men alone. Motors, transmissions, unit power plants etc., can be lifted out of a car in a fraction of the time that otherwise would be required, without a particle of danger to either the men or the part, and with the minimum of effort. The whole front or rear of an automobile may be lifted several feet in the air, to facilitate repairs. Used in this way, the crane surpasses a repair pit, as it may be brought up to a window or other convenient source of light, while the pit often is found to be too dark. The repairman is also given more room in which to work.

The LaFayette Engineering Company, LaFayette, Ind., is making a steel portable crane which should prove especially valuable for garage use. It may be operated by one man and enables him to lift the heaviest part unaided. The feet go underneath the chassis and are long enough to render the crane perfectly stable. The overhang is three feet six inches, so that it has sufficient reach to get around a car in almost any position. It is easy to push around even when loaded, as the wheels run on roller bearings. All parts of the machine are of steel, with machine driven steel rivets, so that it is exceedingly strong and durable. The chain is tested to three tons and is wound on a drum by hand, large reduction gears minimizing the effort required. The weight complete is 900 pounds.

Power Drill.



Another decidedly useful machine is a power drill, as those who have tried to drill steel by hand have abundant reason to know. Not all garages have a source of power, however, and in that event a power drill necessitates obtaining such a source, unless it be equipped with electric drive, as is the 20-inch double back geared upright power drill, made by the Champion Blower & Forge Company, Lancaster, Penn., and illustrated herewith. This is fitted with an electric motor, which may be had in various styles to be used on any type of current.

As nearly every garage is wired for electric lights, this drill has an almost universal application, current being taken from a convenient bulb socket by means of the usual plug and cord. The electric motor is held on an arm of the frame, at such distance from the driving pulley that the belt is long, giving an even uniform drive. Control of the motor is easy, being at all times under the direction of the operator without moving from his position at his work, through a switch conveniently placed.

The machine may be used either as a plain drill or as a back geared drill, the change being made in an instant by sliding the gears in or out of engagement by means of a lever. It will drill with perfect accuracy holes up to 1.5 inch, and is simple in operation, yet

Digitized by Google

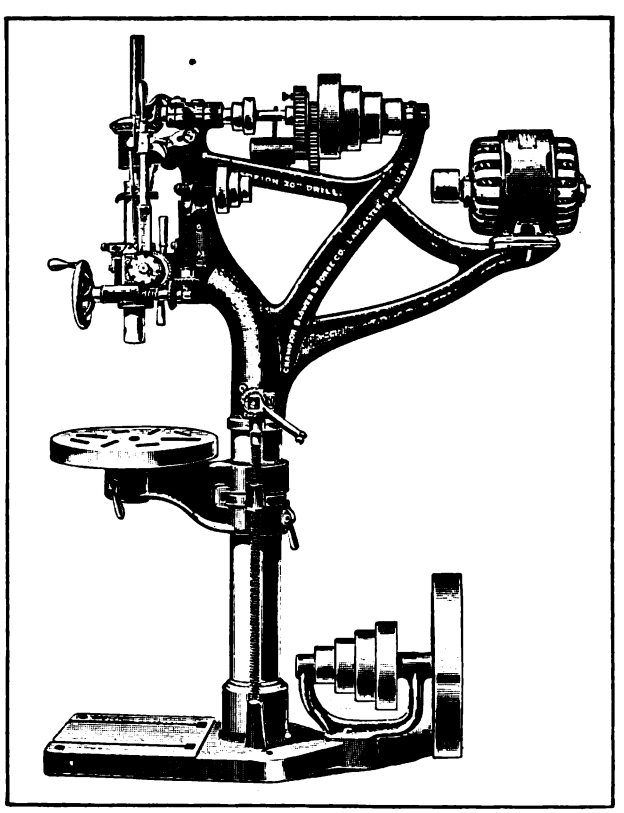
has all the feeds and speeds and automatic features on much more complicated devices. Eight speeds are provided, with power, hand screw and lever feed. The

Universal, Auto-Turntable of 8000 Pounds Capacity, Which Operates on Ball Bearings and Requires but a Depth of 12 Inches.

gears are machine cut and the bearings are large, insuring long service.

The spindle is counterbalanced by a weight in the hollow column, thus relieving the spindle arm of undue strain and making a substantial construction. An automatic stop attachment is provided with a quick return lever, which gives a rapid motion to the spindle. The table is lowered and raised by means of a screw, which is quick in action and self-locking, holding it steady and firm. The handle which operates the screw is conveniently placed.

The drill works to the centre of a 20-inch circle. The spindle is 1.25 inches in diameter and is bored with a No. 4 Morse taper, with a graduated sleeve. The drive is from the motor to pulleys by means of a two-inch belt, the pulleys being of the four-step variety, eight inches in diameter, and with 2.5-inch face. The speed for ordinary drilling is 300 revolutions a minute. A hanger attachment for drilling rims, which will be found very useful about a garage, may be had as extra equipment. The weight complete is 900 pounds.



THE UNIVERSAL AUTO-TURNTABLE.

Numerous stables and other buildings are converted into garages and the original design is such that they do not lend themselves readily to the storage of automobiles without the operator of the car exerting considerable skill in backing the machine into its position. This is especially true of long, narrow buildings. To overcome these difficulties a turntable is fitted and the majority of up-to-date concerns are equipped with one or more of these devices.

In the accompanying illustration is presented the product of the Canton Foundry & Machine Company, Canton, O., maker of cranes, jacks, etc. A feature of the Universal turntable is that it may be installed easily, requiring as it does, but a depth of 12 inches, this arrangement permitting of utilization on upper floors as well as the ground. The device is ball bearing, seven balls operating in a patented grooved, serpentine track. These balls are spaced properly and sustain the weight, and as each member is crowded over the summit another follows into its place. All balls not on a summit revolve in lubricating oil with grooves fully protected from dirt.

The superstructure is of structural steel, built in truss form, top plates are braced, and the entire construction makes for great strength and durability. The table proper has a checkered iron centre, with steel plates extending to its periphery, and these members are sloped slightly to provide for drainage. They are also reinforced by angle irons at proper intervals, these being riveted crosswise underneath and supported on structural trusses. The only foundation required is circular concrete, perfectly level, and slightly larger than the table. The former is grooved to provide drainage to the sewer.

The Universal table is furnished complete with angle iron foundation supporting band firmly bolted to outer rim and the former is fitted with bolts for imbedding into the concrete floor thus holding the band in place. The tables which are operated easily by one person, are made in four sizes, 108, 132, 144 and 156-inch wheelbase with table diameter of 12, 14, 15 and 16 feet, respectively. Each has a supporting

Champion Electric Drive 20-Inch Drill.

capacity of 8000 pounds. A feature of the device is that it cannot tilt as the slightest depression throws castor wheels on the outer rim to the rim track.

MOTORING NEWS OF NATIONAL IMPORT.

Splitdorf Magneto Interests Reorganize with Additional Capital---Two Large Tire Concerns Combine Forces---Personnel of New Henderson Company---Next Year's New York Show---Glacier Park Opened to Automobiles.

The entire automobile industry is interested in the announcement of the formation of the Splitdorf Electrical Company, duly incorporated under the laws of New Jersey, with a paid-in capital of $3,500,000, which will take over the business heretofore conducted under the name of C. F. Splitdorf, Inc., at Walton avenue and 138th street, New York City. The concern is an entirely new organization with a stock issue of $1,500,000 in seven per cent. cumulative preferred shares and $2,000,00 in common stock. John F. Alford, president of the Torrington Company, Torrington, Conn., is direct sponser for the new corporation and becomes its president, while Charles F. Splitdorf has been elected vice president.

C. F. Splitdorf, Inc., is one of the best known concerns in the industry. The growth in the production of Splitdorf magnetos, coils and spark plugs has been decidedly marked, and in the face of strenuous competition has made its impression upon the European market as well as at home. It may be stated in passing that the name of Splitdorf has been connected with electrical devices of one nature or another for over half a century. It is hinted that still other electrical fittings for automobiles are to be expected from his inventive genius in the near future.

The Torrington Company is closely identified with a number of concerns, each with factory facilities in Torrington, Conn., in the manufacture of various automobile accessories, motorcycles, etc. Windshields, carburetors, motor boat engines and similar fittings have been manufactured by it, or its associates, for a number of years. The combination of these interests with those of the Splitdorf laboratories is of distinct importance.

No radical changes are contemplated, for the present at least. As has been stated, Mr. Alvord becomes president and Mr. Splitdorf, vice president, of the new organization. Bryant S. Keefer has been elected treasurer and Carlos W. Curtiss, secretary and general manager. These officers and John R. Viles will constitute the board of directors.

GOODRICH-DIAMOND MERGER.

Two Large Automobile Tire Concerns Amalgamate with Capital of $90,000,000.

One of the largest transactions in the history of the automobile industry is noted in the purchase of the Diamond Rubber Company of Akron, O., by the B. F. Goodrich Company of that city, involving, according to the official statement of the interested parties, the sum of $45,000,000. It would appear that the Goodrich concern is to be reorganized in a measure, the following officers and directors being proposed: Chairman of the board, F. A. Hardy, Chicago; vice chairman, F. A. Mason, Akron; president, B. G. Work; vice president and general manager, A. H. Marks; vice president and works manager, E. C. Shaw; vice president and sales manager, H. E. Raymond; vice president and assistant sales manager, W. B. Miller; secretary, C. B. Raymond; treasurer, W. A. Means; additional members of the board, O. C. Barber and C. C. Goodrich. The official statement follows:

"Goldman, Sachs & Co., announces for itself and Lehman Bros., New York City, and Kleinwort Sons & Co., London, that arrangements have been completed for the purchase by the B. F. Goodrich Company (New York) and the transfer to it of the property and business of the Diamond Rubber Company. The companies, as is well known, occupy premises in the city of Akron, O., and are two of the half-dozen largest and most successful concerns of the kind in the United States, each manufacturing a great variety of rubber goods, including automobile tires.

"The consideration to be paid by the Goodrich company is to consist of $15,000,000 of the seven per cent. cumulative preferred stock and $30,000,000 of the common stock of the B. F. Goodrich Company. For the purpose of enabling it to carry out the transaction the B. F. Goodrich Company will immediately call a meeting of its stockholders for the purpose of authorizing an increase of its capital stock by the issuance of an additional $15,000,000 of the preferred stock and an additional $30,000,000 of common stock.

"When this increase of stock shall be effected, the capital of the B. F. Goodrich Company will consist of $30,000,000 of seven per cent. cumulative preferred stock and $60,000,000 of common stock. Goldman, Sachs & Co., and Lehman Bros., of New York City, and Kleinwort Sons & Co., of London, have agreed to purchase from the Diamond Rubber Company a large block of the stock of the B. F. Goodrich Company, which, together with the previous purchase of stock made at the time of the organization of the present B. F. Goodrich Company, will comprise about one-half of the entire issue of the preferred stock of the latter company and a considerable amount of the common stock as well.

"It is expected that in consequence of the acquisition of this interest by the banking houses named and

Digitized by Google

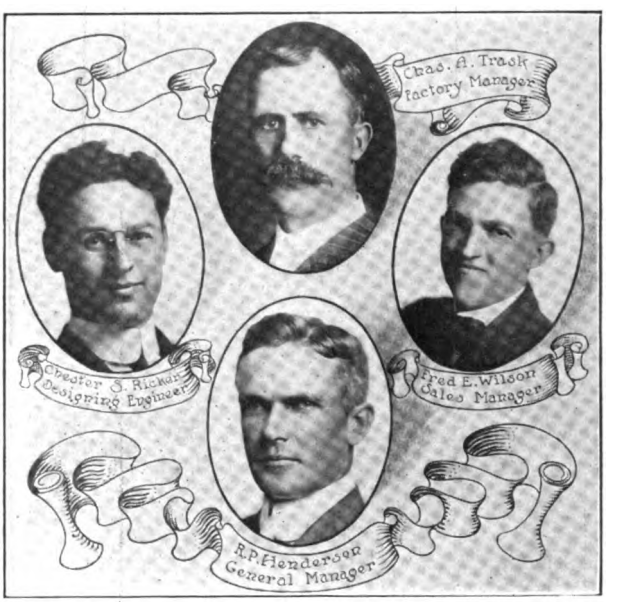
the distribution of a portion of their stock among their clients a very much broader market for the securities of the B. F. Goodrich Company will exist in the future than has ever existed for the securities of either the old B. F. Goodrich Company or the Diamond Rubber Company. Stockholders of the Diamond Rubber Company upon the distribution of its assets will receive a considerable amount of cash in addition to their several shares in the stock of the B. F. Goodrich Company preferred and common.

"The Goodrich company will retain the executive staff of the Diamond Rubber Company in addition to its present staff, and it is not expected that any radical change in organization or operating conditions will occur."

PRODUCE HENDERSON CAR.

Organization of Company Which Will Manufacture Indianapolis Machine Is Completed.

Much interest attaches to the organization of the Henderson Motor Car Company, Indianapolis, Ind., announcement of which was made recently, largely because of the position held by the Henderson Motor Sales Company, to which the new concern is a logical successor. The personnel of the old distributing agency for Cole cars, made by the Cole Motor Car Company, is represented in the new, with the addition of several names which have been more or less prominently identified with the automobile industry for several years.



L. Carter, the president, also is one of the largest stockholders in the Cole Motor Car Company. R. P. Henderson, vice president and general manager, was connected with the Parry Manufacturing Company for a number of years, and has been identified with his brother in the management of the Henderson Motor Sales Company for a considerable period. C. P. Henderson will remain in complete charge of the Cole sales organization, retaining his position as a director of the Cole Motor Car Company, although one of the principal stockholders in the new concern.

Lucius S. French, the secretary, will be in charge of the Henderson advertising. He not only enjoys a wide acquaintance among motor car dealers, but he also possesses a practical knowledge of automobile advertising which has been gained by successful sales promotion work which he has accomplished in the past. The finances will be under the direction of C. K. Share, treasurer, formerly treasurer of the Willys-Overland Company, and a recognized authority on automobile office systems.

Fred E. Wilson is the new Henderson sales manager. He formerly held the same position with the Marion Motor Car Company and is well known by dealers throughout the country. The Henderson factory is to be operated on a system which was perfected by Factory Manager Charles A. Trask, formerly director of one of the largest plants of the General Motors Company. He has only just returned from an extended trip abroad, studying automobile manufacturing plans in Continental Europe and in the British Isles. He also is quite prominent in the Society of Automobile Engineers, being chairman of the committee on papers.

Chester S. Ricker, the chief engineer, is one of the most prominent motor car engineers in the country. He has taken an active interest in the S. A. E. work during the past year, having read a number of papers before that society. Perhaps he is best known as a technical expert, and the articles on motor car construction from his pen have attracted much attention both in and out of the industry.

The advantages of an energetic and harmonious organization have been demonstrated by the Hendersons in the past, and their success has been due, in a large measure, to the fact that every member of the

Department Managers with the Newly Organized Henderson Motor Car Company.

force was a specialist in his respective line. This policy is noticeable in the enlarged concern. The new car will be shown to the public for the first time during the progress of the 500-mile race on the Indianapolis motor speedway, May 30. It will sell for a moderate price, and is claimed to be the only one produced in Indianapolis selling for such a figure.

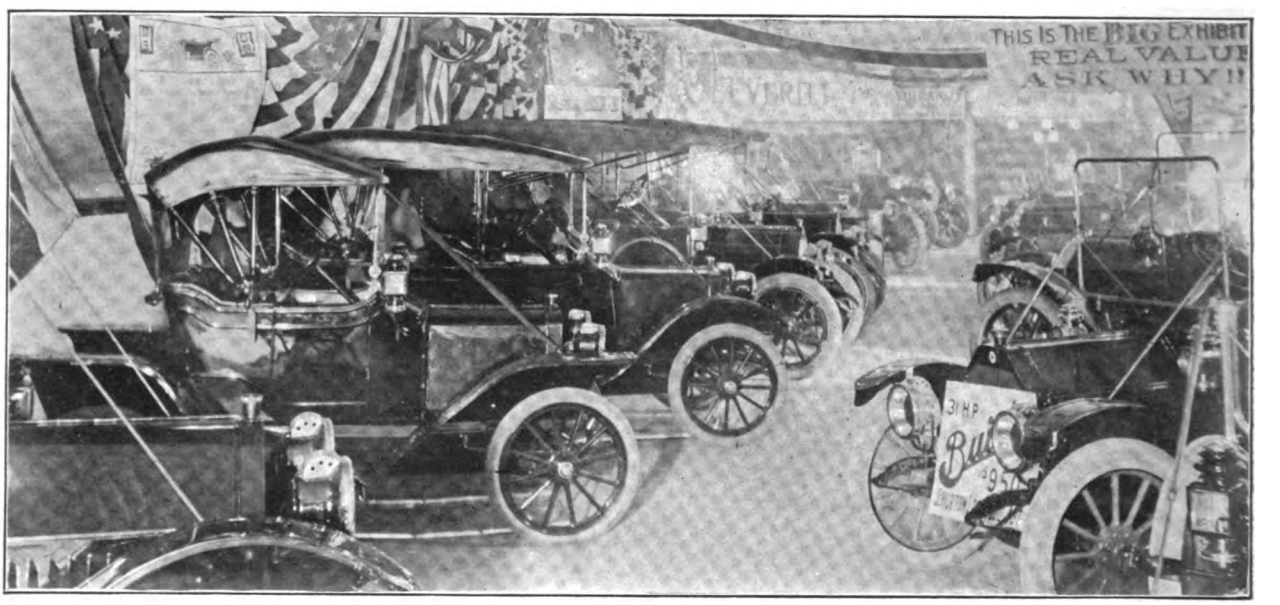
SECOND VERMONT SHOW.

Residents of the Green Mountain State Visit Burlington to See New Models.

While most of the cities and towns on the so-called minor show circuit of the country have held their annual exhibits some time since, Burlington,

Digitized by Google

Vt., waited until the actual opening of the touring season before inviting its citizens to inspect the 1912 models. The event was held early in the month and was termed the second annual Vermont automobile show, being staged in the state armory under the management of George D. Jarvis.



Vermont has developed decided interest in the motor car during the past two years, as was evidenced by the large attendance which greeted this second annual event. The different makes of cars and accessories were disposed about the interior of the building under a canopy of bunting in the national colors, while the entire assembly was brilliantly lighted by electricity. Music was furnished by Lessor's orchestra and a colored quartette from the 10th U. S. Cavalry, stationed at Fort Ethan Allen. Several sales of importance were made throughout the display which was a decided success from every viewpoint.

ONE NEW YORK DISPLAY.

Two Buildings to Be Utilized by Automobile Board of Trade for 1913 Exhibit.

While all sorts of rumors have been circulated respecting the national show in New York City next January, it was not until recently that any definite statement had been made by the parties most directly interested. Previous to the holding of the Madison Square Garden display of last January, it was announced that it would be the last showing of automobiles in the historic structure. Since that time plans for tearing down the building have been held in abeyance, and it is now announced that the 1913 show will be held therein.

More properly speaking, there will be two shows,

Interior of State Armory at Burlington, Vt., During the Progress of the Recent Second Annual Vermont Automobile Show.

Among the exhibitors of cars were the following: H. G. Bennett, Barre, Cadillac; H. D. Drury, Essex Junction, Westcott; Flanders Auto Company, Burlington, E-M-F, Chalmers, Overland, Jackson; Geo. D. Jarvis, Burlington, Ford; Walter B. Johnson, Essex Junction, Velie, Paige-Detroit; A. F. Lauzon & Co., Burlington, R-C-H; J. Horton Lockwood, Burlington, Buick; H. S. Morgan, Burlington, Hudson; Dr. George D. Samson, Burlington, Everitt; Van Ness Garage, Burlington, Reo, Mitchell, Premier; Vergennes Auto Company, Vergennes, Oakland; H. L. Ward, Burlington, Stearns-Knight.

Accessories were displayed by the following: Sherwin Electric Company, Standard Oil Company, Spear-Martin Fur Company, Underhay Oil Company, William L. Tobey, L. C. Demain, L. K. Goddard and Geo. D. Jarvis & Son.

as the Automobile Board of Trade holds a lease for the new Grand Central Palace, in which the National Association of Automobile Manufacturers held a display this year. However, the two displays will be under the same management in 1913. The Automobile Board of Trade will divide the exhibitors between the two buildings, and while both will be open to all makers of cars and accessories, the scheme for the allotment of exhibition spaces has not been worked out as yet.

Regarding the demolition of the Madison Square Garden, it appears to be decided definitely that it will not be accomplished until late in 1913. The new arena which was to have been utilized by the Automobile Board of Trade for next year's show, will be completed in time for the 1914 exhibition, it is anticipated.

GLACIER NATIONAL PARK.

Motorists Win Permission to Utilize Their Cars in One of the Government Preserves.

The secretary of the interior, under whose jurisdiction the various national parks of the country are held, has issued regulations concerning the admission of automobiles to the Glacier national park in Montana as follows:

"No automobiles will be permitted within the metes and bounds of the Glacier national park unless the owner thereof secures a written permit from the superintendent or his representative. Applications for permits must show: Name of owner, number of machine, name of driver and inclusive dates for which permit is desired, not exceeding one year, and be accompanied by a fee of $1 for a single round trip through the park, or a fee of $5 for each machine per annum.

"Permits must be presented to the superintendent or his authorized representatives at the park entrance on the government road. The permittee will not be allowed to do a transportation business in the park without a special license therefor from the secretary of the interior.

"The use of automobiles will be permitted on the government road from Belton, Mont., to administrative headquarters at Lake McDonald between the hours of 7 in the morning and 9:30 at night.

"Automobiles will stop when teams, saddle horses, or pack trains approach, and remain at rest until they have passed or until the drivers are satisfied regarding the safety of their horses.

"Speed will be limited to six miles an hour, except on straight stretches, where approaching teams, saddle horses and pack trains will be visible, when if none be in sight, this speed may be increased to a rate indicated on signboards along the road; in no event, however, shall it exceed 15 miles an hour.

"Signal with horn will be given at or near every bend to announce to approaching drivers the proximity of a machine. Horses will have the right of way and automobiles will be backed or otherwise handled as necessary, so as to enable horses to pass with safety.

"All permits granted at any time when automobiles can enter the park will expire on Dec. 31, of the year of issue."

THOMAS COMPANY HEADS.

Men Who Direct the Production of This Well Known Car Under Present Management.

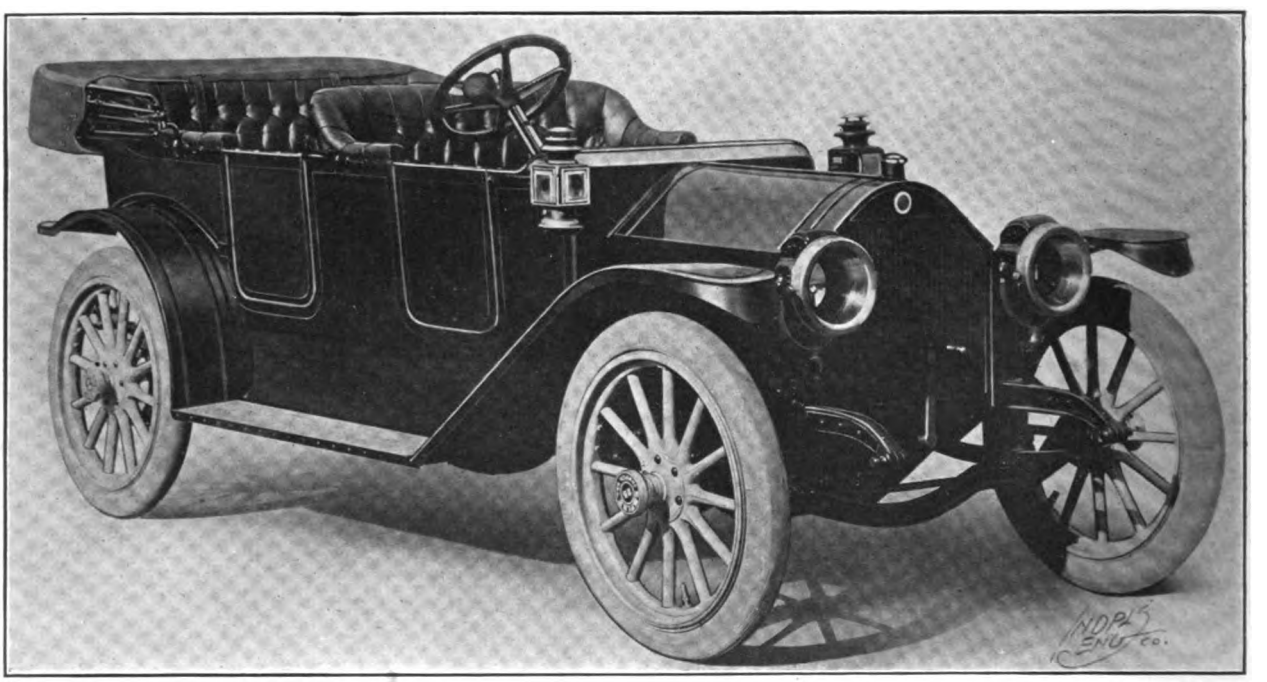
Since the reorganization of the E. R. Thomas Motor Car Company, Buffalo, N. Y., maker of Thomas cars, something over a year ago, the aim of the officials has been to bring about a strong organization of men, able to work together in complete harmony. It has been maintained that in the automobile business nothing is of greater importance than the personnel of the factory executive heads.

Officials and Department Heads of the E. R. Thomas Motor Car Company.

The reason for this lies in the rather complex nature of the business with its numerous departments, such as engineering, stock, purchasing, manufacturing, accounting, financing, advertising, sales, service, etc. Each requires a capable supervisor to maintain a high standard of excellence and from all is demanded the fullest co-operation in order to secure the necessary unity of action.

Accompanying photographs present the leading executive heads of this institution, each of whom has had many years of experience with the best known makers of high grade cars in America.

Digitized by Google



THE EMPIRE 1913 TOURING MODEL.

THE Empire Automobile Company, Indianapolis, Ind., has announced that its 1913 line will include the Empire "25," which is designated as the "Little Aristocrat." The appellation is applied because it is maintained that the machine, despite the low price, has the appearance of a costly vehicle, with power, speed and endurance to satisfy the most exacting motorist. The body is particularly smart and it is said to be the design accepted following a competition by builders for a prize offered by the company, this policy being adopted to secure the submission of as many ideas as was possible.

The company has for several years produced a well known roadster, this being conservatively rated at 20 horsepower, which was its specialty until the advent of the new model. The "25" chassis is fitted with a touring body that has a seating capacity of five, and the "Little Aristocrat," with increased wheelbase as contrasted with the roadster, is termed the "big brother" of the runabout type so familiar to motorists. The purpose of the company is to market this machine as a standard and to develop and specialize it as a vehicle especially adapted to the needs of the great majority of automobilists.

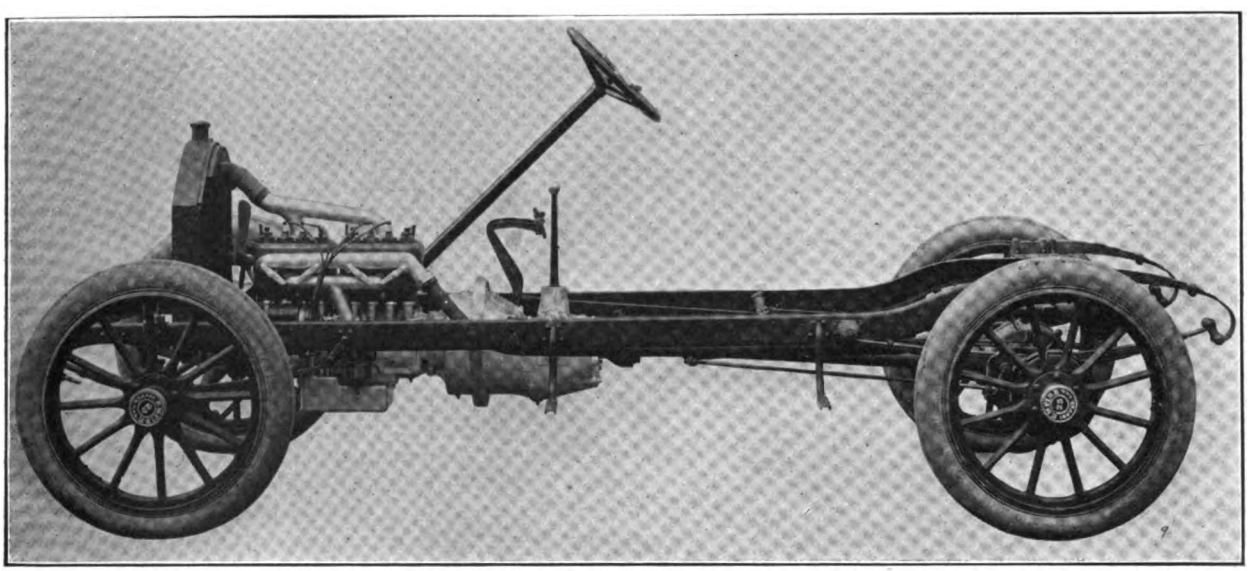
The chassis was designed with a view to securing the greatest degree of simplicity and the complete accessibility so desirable for satisfactory maintenance and repair and the protection of all moving parts from abrasive substances that would cause unnecessary wear. In simplification of the design departure was made to a considerable extent from the runabout model, but these changes are principally with the power plant, which is an entirely new creation. The policy of the designer has been to incorporate in the car features that are characteristic of machines of decidedly higher price and to have all the comfort to be found in vehicles of greater proportions.

The motor, clutch and transmission are a single assembly, contained in one housing and forming a power plant that is in every way protected against the usual causes for deterioration. The design is exceedingly simple and efficient and it is maintained that the car will carry a load of five passengers and make 40 miles an hour over average roads, having an unusual degree of flexibility and being particularly easy to control.

Three-Quarter View of the 1913 25 Horsepower Touring Car, the Latest Production of the Empire Automobile Company.

The engine is a four-cylinder, four-stroke cycle type with L head cylinders, the valves being located at the left side. The cylinder units are cast in pairs and are a fine quality of gray iron, the bore being 3.5 inches and the stroke 4.5 inches. The horsepower rating by the S. A. E. formula is 19.6, but as the ratio of stroke to bore is 1.285 to one, and there is undoubtedly greater power with the long stroke engine, the claim of the maker that the motor will produce 25 horsepower is conservatively based. The cylinders are cast with the heads and the water jackets integral, and with large openings in the head of each unit, by which the core is removed. The jacket spaces are designed to insure satisfactory cooling and positive

Digitized by Google



circulation of the water, which enters the cylinders at the base of the jacket on the right side and, after circulating around the cylinder walls, is carried off by large outlets at the top of the cylinders to which the outlet manifold is connected. These outlets are covered by plates secured by cap screws.

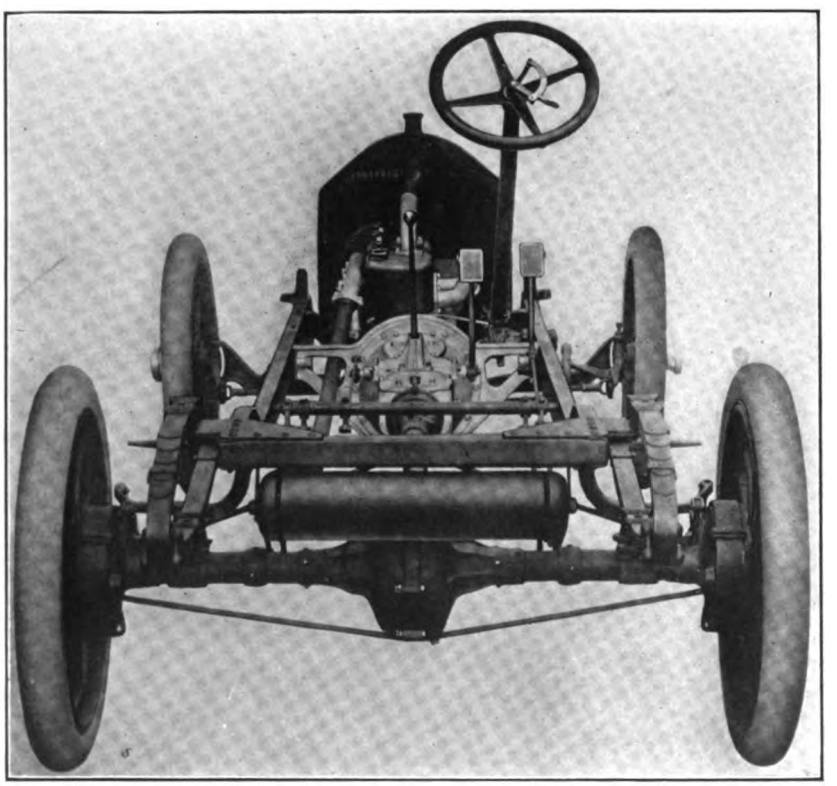
The cylinders are bored, aged to insure against distortion from internal stresses, then reamed and ground to size. The pistons are of the same grade of gray iron and after being turned are ground to fit the cylinders. The pistons are fitted with three rings that are turned and ground on the edges and the periphery, fitting the ring channels accurately.

The crankcase is an aluminum casting in three sections, one of which is the bottom and another the housing that encases the timing gears. The crankcase main section is divided by a cross web that carries the centre main bearing. There are pits formed in the bottom section to collect the lubricant into pools beneath each crank throw and in the divisions are ducts by which a level is maintained. The ends of the case and the central web carry the main bearings for the crankshaft and the camshaft. Attached below the bottom of the crankcase is the reservoir for the lubricant, which has a capacity that will permit driving several hundred miles without replenishment.

The crankshaft is installed from the rear of the assembly. It is of a superior quality of steel, carefully ground to size and heat treated to insure strength. It has a diameter of 1.5 inches save at the rear bearing, where the diameter is increased to 1.625 inches, and a total length of bearings of 10.25 inches, the length of the forward, middle and rear bearings being 3.5, 2.75 and four inches, respectively. The bearings are lined with a fine quality of antifriction metal, scraped to an accurate fit. The camshaft is made of a similar quality of metal as the crankshaft and is of large size, finished with much care to insure strength and durability. The camshaft is carried in three large bearings of high class metal. The connecting rods are of steel I section, drop forged, and the big ends are fitted with bearings of fine metal two inches in length at the crankpins. These bearings are carefully secured and may be adjusted as desired. The wristpins and the wristpin bearings are large and the pins are hardened and ground to size.

The valves have ports of 1.5 inches diameter and abundant clearance to insure complete exhaust of the burned gases and adequate aspiration of the fuel charge. The valves are nickel steel heads with steel stems and are designed for hard service. They are actuated by large tappet rods that are provided with adjusting screws and nuts to compensate for wear, and the tappet guides, the tappets, the springs and valve stems are enclosed to protect them from water, dust and other abrasive substances. The protection is such that there is easy access to the valve mechanism for adjustment or restoration.

Side View of the 1913 25 Horsepower Empire Touring Car Chassis, Showing the Unit Power Plant and the Centre Control Lever.



The motor is cooled by the thermo-syphon system, the water circulating through the liberal water spaces of the engine and being cooled by a large radiator, the radiation being heightened by a fan mounted on a bracket at the forward end of the crankcase and driven by a belt from a pulley on the extension of the crankshaft. The bracket is so designed that the belt may readily be adjusted for tension. The engines have been driven under all conditions and the radiation has been such that no motor has ever been overheated.

The lubrication is by a gear driven pump that draws the oil from the reservoir beneath the engine case and causes the three main bearings to be flood-

Digitized by Google

ed. The excess oil is drained into the four pits beneath the crank throws, into which the big ends of the connecting rods swing, the splash affording lubrication for the camshaft bearings, the cams, tappets and tappet guides, the wristpins and their bearings and the pistons and cylinder walls. The drainage from the forward main bearing supplies the lubricant for the timing gears and their bearings. The overflow from the oil pits drains to the oil reservoir, where it is filtered and again pumped through the system.

The ignition is by a high-tension magneto, with a set spark, driven by an outside shaft, there being no advance lever, the only adjustment possible being through change of timing. The wiring is exceedingly simple, there being the four leads from the distributor to the four spark plugs and the ground connection through the switch. The switch is located on the dash within convenient reach of the driver. The engine is started with the magneto with a quarter-turn of the crank, there being no battery necessary. The wiring is short and heavy, well protected from water, oil, dust and the usual causes for wear. With but a single system and few leads of cable there is a minimizing of complications and greater certainty of endurance. The carburetor is a float feed automatic type, giving a uniform mixture at all speeds.

Rear View of the 1913 Empire Touring Car Chassis, Displaying the Spring Suspension, Rear Axle Construction, and the Power Plant and Control Mechanism.

The clutch and the flywheel are incorporated in one assembly contained within a housing bolted to the rear of the engine case, to which access is had by a large handhole covered with a plate retained by cap screws. The clutch is of the disc type, with a plate nine inches diameter, faced with Raybestos. This clutch is operated without lubricant, is easy in engagement and does not cause jolts or jars, while it is proof against heating.

Bolted to the clutch housing is the transmission case, also of aluminum, which protects the gearset of the selective type, having three forward speeds and reverse. The gears are large, with .875-inch face, of specially treated steel, and the shafts are of similar proportions and material, mounted on annular ball bearings throughout. The gearset is designed for hard service and is expected to endure under any character of work to which it may be subjected.

The power plant is installed on the forward frame cross member and is supported by two arms integral with the clutch and flywheel housing that are fitted into the channels of the frame side members. These arms are made in skeleton form for lightness.

The drive is by propeller shaft from the transmission shaft through two universal joints to the differential gear incorporated with the semi-floating rear axle. This rear axle assembly includes two sections of the differential housing, to which are riveted the tubes containing the driving shafts. The driving shaft with the pinion shaft, carried on heavy bearings, is protected from torsional strains by a stout torsion tube to the forward end of which radius rods extend from yokes just within the brake flanges of the axle. The axle is further supported by a truss rod that is adjustable and insures against the strains of a heavy load.

The driving shafts of the axle and the differential gearing are mounted on substantial bearings, the wheels being keyed to the ends of the shafts. The axle housing, reinforced for strength, carries the spring saddles, and the sturdy flanges for the brake shoes.

The front axle is a special steel drop forged I section with unusually large yokes, it being designed to have extreme endurance. The steering knuckles are of similar proportions and the spindles have uncommon strength. The tail lever and the tiebar are intended to have great wear. The tiebar is behind the axle to protect the bar from contact with road obstructions.

The frame is of pressed steel channel section of

Digitized by Google

liberal dimensions and it is raised at the rear to permit the use of the three-quarter elliptic springs. There is one cross member besides the end members and the arms supporting the power plant assembly. At the rear the gusset plates are riveted to the top of the frame and the plates are of heavy metal, extended outward to support the ends of the upper quarter of the suspension springs. The plates are lower than the spring quarters and to them are bolted the springs, heavy clips being used. The lower halves of the springs are supported by the saddles and large clips. The rear ends of the springs are shackled and the forward ends are carried by a substantial hanger. The forward springs are semi-elliptic and these are carried under the chassis frame. The wheels are wood, artillery type, 32 inches diameter, and are fitted with quick detachable rims and 32 by 3.5-inch tires. The wheelbase is 104 inches.

The control is by a steering column with a 17-inch hand wheel with aluminum spider set at the right side, there being a throttle lever mounted above the wheel. The steering gear is the full worm and gear type and is irreversible. The clutch is controlled by the left pedal, which is also connected with the emergency brake, so that by "pushing through" the clutch pedal the emergency brake is applied. The service brake is actuated by the right pedal. The service brake is external contracting on drums on the rear wheels and the emergency brake is external expanding within the same drums. The brakes are of liberal size and extremely powerful. The speeds are secured through the shifting lever of the gearset which is mounted on top of the transmission case and is in the centre of the car at the left of the driver. There is no connection between the transmission and the chassis frame and the power plant is protected against the torsional stresses that might result from linkage or direct attachment. The fuel supply is contained in a tank under the driver's seat of 12 gallons capacity, and it is supplied to the carburetor by gravity. The motor is unusually well silenced by a large muffler installed under the rear of the chassis, and by a long exhaust pipe of generous proportions.

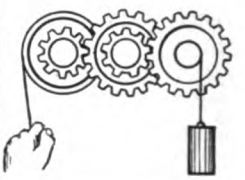
The chassis is equipped with a commodious body of aluminoid steel with wood frame and trimming, of the full vestibule fore door type, the design being with straight lines from front to rear. The dash and the cowl of the body are a single casting that gives unusual rigidity to the chassis and to the body. There is abundant leg room in the forward compartment and the tonneau is ample in size, seating three comfortably. The seats are wide and deep and are especially restful, having low cushions and easy springs, with upholstering of excellent leather. The doors have all handles fitted inside the body. The fenders are wide and graceful and the body is protected by a mud apron between the chassis and the running boards. The running boards are entirely free and the car can be entered from either side without obstruction. The finishing hardware is nickel plated.

The car as marketed is equipped with a horn, a set of five lamps, two gas headlights, and oil dash and tail lights, tools, jack, and tire repair outfit and foot pump.

NEW LUBROLEINE PACKAGES.

The latest edition of "The Mission of Lubroleine," published by the Fiske Bros. Refining Company, 24 State street, New York City, maker of Lubroleine lubricants, is ready for distribution and will be sent free to all who make request. The booklet is replete with information regarding the proper lubrication of the motor car, and among other things calls specific attention to the new packages in which a portion of the product of the company will be packed in the future. This applies more particularly to Lubroleine gearcase lubricant, formerly known as Phoenixo, and to Lubroleine gearcase compound, which are now packed in square cans instead of round. The name of Centaur graphite grease also has been changed to Lubroleine graphite grease, and that of Climax Synovia to Lubroleine cup grease.

CRAWFORD NOTCH TO BE A PARK.



Crawford Notch, the beautiful "Gateway to the White Mountains," which is used by so many motorists in touring in that section, is to become the property of the State of New Hampshire and be maintained as a park, as befits its scenic splendor. Gov. Robert P. Bass has been fighting for some time to secure possession of the property from the timber owners who threatened to mar its beauty by their logging operations, and by a recent decision of the supreme court condemnation proceedings are to be instituted. A commission has been appointed, and will go over the property to make the award. This will be welcome news to lovers of the famous New England district, for the logging operations threatened to spoil the beauty of the mountain sides.

IMPORTANT GOOD ROADS MEETING.

Six states are to be represented in the fourth annual Intermountain good roads convention which is to be held in Logan, Utah, on June 12-14. It is expected that the convention will be the largest of its kind ever held in the Rocky Mountain district, with delegates present from Colorado, Wyoming, Montana, Idaho, Nevada and Utah. The accommodations of the city, though there are several hotels, will be inadequate, it is thought, and arrangements have been made with the Oregon Short Line to fill the sidings of the town with sleeping cars for the visitors. One of the main objects of the convention will be to work to secure government aid in the construction of roads in the mountains, where road work is so expensive and needs to be so well done. Interstate highways will be also featured.

RECENT MOTOR VEHICLE PATENTS

Youngs Fuel Lock.

One of the most practical methods of locking the motor car to prevent theft or its use by other than the owner or operator, is cutting off the supply of fuel to the carburetor. Fred Elliott Youngs, Detroit, has been granted a patent for a fuel locking device which may be operated from the seat, the securing mechanism being fitted to the dash. Interposed in the main line is a valve member which shuts off the supply of fuel. Extending from the device is a housing, carrying a rotating member which actuates the valve. The top of the housing is equipped with a locking device which prevents the valve being opened by others than those possessing the key.

Lutwyche Headlight.

The development of electric lighting equipments for the motor car has stimulated the efforts of inventors and a novel lamp has been patented by Edgar J. Lutwyche, Chicago. The lamp casing proper is open at one end and has a reduced neck at the opposite extremity. Within this member is fitted the electric lamp consisting of a parabola, the larger end of which is secured to the main lamp and cushioning means are also provided. The bulb extends horizontally from its socket and is equipped with the usual means for connecting the wires.

Hylton Hood Hinge.

Water tight hoods are essential on the motor car to prevent rain from reaching the power plant and affecting the operating of the ignition system. John C. Hylton, Chicago, has patented a hinge which differs from those of ordinary construction inasmuch as each of the two companion leaves have the whole of one edge rolled in cylindrical shape and these formations partially enclose each other. Each cylindrical edge being greater in extent than a semi-circle, the leaves are held in pivotal connection at any desired angle to each other. Each end is provided with notches adjacent to the ears and thimbles on the ends of the latter project into these notches.

McKiel Lamp Connector.

Recently, considerable attention has been paid to the development of automatic rotating headlights by inventors and a new design is noted in the device upon which James B. McKiel of Marshall, Tex., has secured a patent. The movement of the light in conjunction with that of the vehicle is obtained through an arm attached to the reach rod of the steering mechanism. The lamp is rotably mounted and is fitted with a spring arm member which is connected to the actuating member by a pivotal link.

Pieper Electrolytic Cell.

A patent has been granted to Oscar H. and Alphonse F. Pieper, Rochester, N. Y., for an electrolytic cell. It comprises a hollow chamber having radiating compartments with connecting passages at the top and bottom, also with the electrode chamber. The bottom of the latter is lower than that of the other members, and is designed to collect any and all sediment that may be present. The chambers and passageways are formed of an integral casting having apertures in alignment with the passageways and clean-out plugs are fitted in said apertures.

Gooderham Windshield.

A windshield of the adjustable type, also permitting the upper part to be displaced when desired, has been patented by Albert E. Gooderham, Toronto, Canada. It comprises an upper and lower sash so arranged to be moved into the same vertical plane, or into a plane at an inclination thereto, so as to present an opening between the top edge of the lower member and the bottom edge of the upper. The upper part is provided with foldable means as well as for holding. Its position is secured by stay rods carrying slidable brackets, and to these members are attached braces pivotally connected.

Klell Convertible Body.

A convertible automobile body presenting interesting features, inasmuch as it combines the function of touring car and limousine, has been patented by Albert Klell, West Park, O., assignor of one half to Henry Barnes of Cleveland, O. The regular open body is equipped with a laterally projecting border about its top. The closed body is fitted with barrel members, these registering with recesses in the other body, and having rotary locking devices for the purpose of fastening securely both bodies. It is claimed by the inventor that the upper body may be removed or replaced in a short time and that the design is such that it does not detract from the appearance of the vehicle.

OTHER PATENTS GONE TO ISSUE.

Lamp Support, James B. Eastes, Konowa, Okla. A support for automobile headlights connected with the steering reach rod, so that lamps are turned as the car turns.

Horn Bulb, H. W. Lester, assignor to the Post & Lester Company, Hartford, Conn. A horn bulb provided with

Digitized by Google

a metal ferrule covering the neck and flaring back toward the body preventing undue distortion of the rubber and consequent cracking.

Tire Tool, Adam A. Long, Rochester, N. Y. A bar, one end of which fits around the wheel hub and other is formed as a handle, bears a plate which guides the tire into the rim. Placing the plate on the rim and the bead of the tire on the plate, it is only necessary to swing the bar around the wheel to force the tire into the rim.

Electric Horn, Solomon Rosofsky, Brooklyn, N. Y. A wheel rotated by a motor strikes against the arms connected to a diaphragm, the bearing of these arms on the wheel being adjustable from the outside, regulating the sound.

Motor, James F. Hopper, Sherman, Tex., assignor of one-half to Hamlet C. Smith. Motor in which compressed air is injected into explosion chamber to ignite charge.

Limousine Top, Oscar N. McCallister, Mount Vernon, Ind. A top adapted to transform the usual touring car into a limousine.

Top, Alexander Ritchie, Detroit. Has only one bow at each side of the seat, being held at the front and the rear by straps.

Hydrometer, Edward W. Smith, Philadelphia. A hydrometer for storage batteries consisting of a syringe containing the hydrometer proper, the nozzle of the syringe being closed by a block containing an S shaped passage which excludes air, so that the syringe full of fluid may be inspected where convenient.

Windshield, James E. Stevenson, Puyallup, Wash. A windshield adapted to fold on itself at the side of the car, the transparent part being of flexible material carried on rollers on the dash.

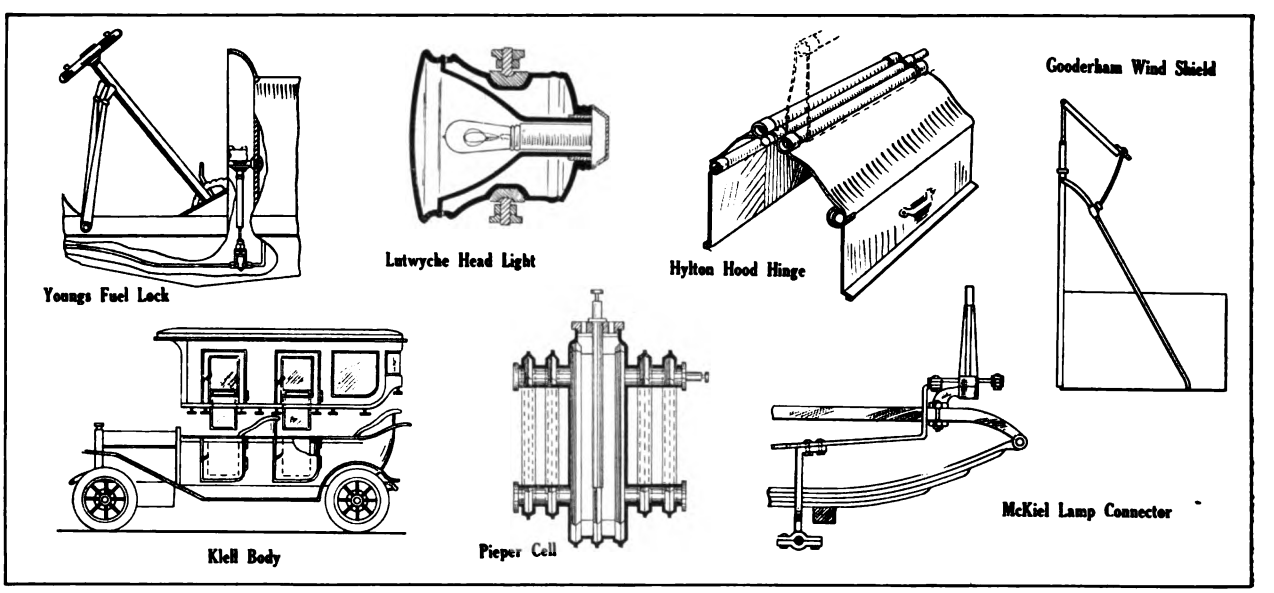
Whistle, Emmet P. Gray, Detroit. An exhaust whistle attached to the side of exhaust pipe, with which it connects by means of a valve, normally closed. The opened valve extends into the pipe, directing part of the gases into whistle.

Spark Plug, Luther H. Wattles, Providence, R. I., and Matie C. Messler, Pawtucket, R. I. A spark plug containing a piston actuated by the motor compression and revolving the armature of a generator to produce an electric current.

Nut Lock, Elmer L. Minnig, Harrisburg, Penn. Nut is provided with a pin bearing an eccentric pawl which engages with the threads of the projecting end of the bolt, preventing loosening of nut until pawl is thrown out of engagement with threads.

Indicator for Acetylene Generator, Joel E. Hill, Lexington, N. C. An indicator for acetylene gas generators, by means of which the amount of carbide unconsumed is shown.

Seat, Ludwig Wilkening, Hanover, Germany. A spare seat for automobiles, made of wire with a curved spring beneath the side member.



Control Lever, Alfred T. Sturf, Flint, Mich., assignor to Buick Motor Company. A control lever for fore door bodies, the sector being attached to the top of the door, inside. This lever is provided with a handle and is adapted to engage and manipulate other levers not so provided, beneath the sector.

Steering Rod, Jacob H. Stull, Fremont, O. A universal jointed steering rod which may be tilted in any direction and is provided with means for holding it in any determined position.

Air Pump, Frank C. Virtue, Toronto, Can. Has inlet valve at bottom and outlet valve to hose at top. The foot irons are adapted to fold along the pump cylinder.

Spring, Herbert Austin, Barnt Green, near Birmingham, England. A full elliptic spring, the middle of the upper member of which is pivotally attached to the frame while the inner end is linked to the pivot connection of the corresponding end of the lower member to the frame.

Spark Plug, Vincent G. Apple, Dayton, O. The ends of the centre electrode are fused intimately with the insulating material of the core, effectually closing the passage through which the electrode is inserted.

Latest Ideas of Inventors Along Lines of Interest to the Manufacturer, Agent and Owner, Including Fuel Locking Device, Rotating Headlight, Convertible Body, Etc.

Motor, Harry Whidborne, Plymouth, and J. J. Lishman, Salcombe, England. A motor of the two-cycle type, with a two-diameter piston. The cylinders are arranged in pairs, the larger end of one piston compressing a charge for the explosion chamber of the other cylinder. The large end works in an annular chamber in two parts and compresses two independent charges of gas and air.

Oil Can Holder, Amos Hutton, Chicopee Falls, Mass. A bracket holding a bar which is provided with an aperture guarded by jaws which grip the spout of an oil can.

Motor, Robert McKee, Philadelphia. A reversible four-cycle motor, in which means are provided for advancing the lead of the cams when reversing and at the same time keeping the direction of revolution of the camshaft unchanged.

Windshield, Frederick Schimpfer, Union, N. J. A windshield in three parts, the lower one fixed, the middle one hinged to this, and the upper one pivoted to the frame.

Carburetor, Frederick Barthel, Detroit, assignor of one-half to F. E. Wadsworth. A carburetor for two-cycle engines, in which the needle valve opens directly into the cylinder. The crankcase compression is communicated to the gasoline in the device, forcing it into the cylinder at the same time that the air escapes through the port into the cylinder.

SUCCESS WITH REPUBLIC TIRES.

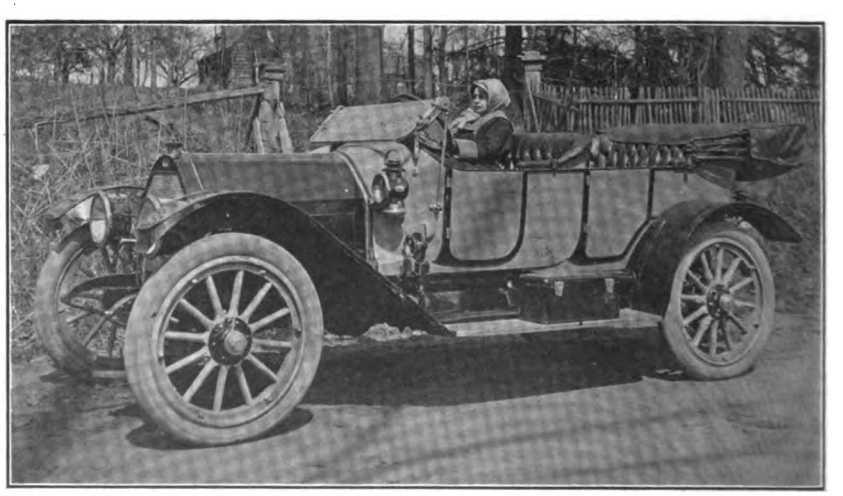
A particular instance in which a salesman has won deserved promotion after several years of earnest endeavor to prove his worth to the concern with which he is connected, is that of John H. Kelly, recently appointed sales manager of the Republic Rubber Company, Akron, O., maker of Republic tires. Mr. Kelly was for nine years manager of the Chicago branch of the company, the business of which grew under his direction until it was second in importance only to that conducted by the home office, itself.

John H. Kelly, Sales Manager, Republic Rubber Company.

He is decidedly well known in the motoring world, largely because of his connection with the reliability runs and hill climbs conducted by the Chicago Motor Club, of which he is a member. In fact, his acquaintance is much wider than the industry, as for 14 years prior to his connection with the tire business he was actively engaged in the sale of bicycles. As a member of the Cycling Club of Chicago he was particularly enthusiastic in promoting this cause, pushing his wheel over most of the highways of northern Illinois in the interests of good roads and the mount which he represented.

Soon after becoming identified with the Republic Rubber Company, as manager of the Chicago branch, Mr. Kelly joined the Chicago Automobile Trade Association and a little later was selected as one of its directors. As was true of every endeavor with which he became identified, this association received his very best effort. Undoubtedly, while the members will join with many others who know him, in congratulating him upon securing added responsibilities in his new field, they cannot help regretting that his removal to Akron will result in a distinct loss to motoring activities in Chicago.

GROSSMAN OFFERS PRIZES.



The Emil Grossman Company, New York City, has offered prizes to the amount of $1350 to the winners in the 500-mile race at Indianapolis on Memorial Day, provided they use Red Head spark plugs. The winner will receive $1000, second $250 and third $100, on this condition.

COLE CAR MATCHES HER HAIR.

Senor Juan Peixotto Asunsulo of Brazil recently called at the salesrooms of the Colt-Stratton Company, New York City, eastern distributor for the Cole Motor Car Company, Indianapolis, Ind., and desired that Capt. Harry L. Stratton, vice president of the concern, should show him a car that would accommodate four people. Capt. Stratton suggested a Cole toy tonneau model, and a demonstration brought about an immediate sale.

There was only one proviso and that was that the trimming on the body work should match exactly Senora Asunsulo's hair, which her husband declared was of the most beautiful golden brown in the world. It was a decidedly new proposition for Capt. Stratton, but he undertook to fill the order as given and succeeded so well that Senora Asunsulo and her husband declared themselves the happiest Spaniards alive when the machine was ready for delivery and shipment to Brazil.

An accompanying illustration presents Senora Asunsulo at the wheel of her new car, as taken just before her departure from New York for her home in Brazil. The hood and panel work are of rich golden brown, while the remainder of the body is in pleasing contrast.

Senora Asunsulo of Brazil in Her Cole Toy Tonneau, the Color Scheme of Which Matches Her Hair.

TO SELL OVERLANDS ABROAD.

Claude A. George has been selected by President John N. Willys of the Willys-Overland Company, Toledo, O., to represent the maker of Overland cars abroad in the establishm e n t of an European depot at Hamburg, Germany. The choice is one which will meet with favor by a large number of people both in and out of the industry, who are well acquainted with Mr. George and his particular fitness for the commission.

Claude A. George, Foreign Manager, Willys-Overland Company.

His connection with the industry has been such as to command widespread attention, having been assistant sales manager of the Willys-Overland Company for several years. Previous to his connection with that concern he was an European representative of the Eastman Kodak Company, so that his field in the new work assigned to him is by no means unknown by him.

The foreign business of the Overland has grown so fast during the last year that this move was regarded as absolutely essential. Several agencies are maintained all over the Continent, as well as on the British Isles, and the Overland product has come to be recognized as particularly adapted for the foreign market. The future success of the enterprise will depend largely upon Mr. George, and his many friends will agree with President Willys in believing that he will meet the opportunity.

SALESMEN RELIEVE FARMERS.

A decidedly novel idea in selling automobiles to farmers has been put into operation by western salesmen of the United States Motor Company. Farmers at this time of the year are too busy ploughing and doing other farm work to have time to talk to salesmen, so one enterprising man evolved the idea of carrying a farm hand or two to relieve the farmer while he looked over the car and took a demonstration. The scheme seems to be meeting with success, the farmers being willing to talk automobile when they know that their work is not being delayed.

YEATS RESIGNS TO FORM COMPANY.

G. H. Yeats, who for the past year and a half has been assistant sales manager of the Abbott Motor Company, Detroit, and previously had been sales manager of the company since its formation, has resigned. He has organized the G. H. Y. Auto Supply Company in Detroit, and has taken a store at 882 Woodward avenue, where a general line of automobile supplies will be carried, and a large jobbing and retail business conducted. This change from an important position with an automobile concern to a supply house has caused considerable surprise to Mr. Yeats' friends and the trade as well.

NOW WITH BAKER ELECTRICS.

An important announcement is made in the information that H. A. Worman, formerly advertising manager of the National Carbon Company of Cleveland, O., has become identified in the same capacity with the Baker Motor Vehicle Company of that city, maker of Baker electric pleasure and commercial cars. Mr. Worman is recognized as an authority on advertising and selling, frequent articles from his pen having appeared in magazines devoted to constructive work along these lines.

After leaving college, he associated himself for a period of five years with the National Cash Register Company, Dayton, O., obtaining valuable experience, which has been combined with his own natural aptitude for this field of endeavor. Later he became identified with the A ddressograph and International Harvester companies of Chicago.

H. A. Worman, Advertising Manager, Baker Motor Vehicle Company.

Since removing to Cleveland, Mr. Worman has been actively interested in the development of classes in sales and advertising methods in connection with the Y. M. C. A. schools. He is regarded as a convincing lecturer and writer upon the subject of his profession and the Baker Motor Vehicle Company is to be congratulated upon securing his services.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Columbus Gets the Convention.

According to the constitution of the Federation of American Motorcyclists, official notice of the national assembly must be made in the various motorcyling journals, and in compliance with that provision the following official communication from President G. H. Hamilton is presented:

Editor, Automobile Journal—
Kindly be advised that the city of Columbus has been selected for the 1912 F. A. M. national meet. The Cleveland Motorcycle Club and Columbus Motorcycle Club were the two clubs making a bid for the meet and a majority of the directors voted in favor of Columbus. There were five votes for Columbus, two for Cleveland and at this writing the votes from the other two members have not been received.

I would appreciate very much your making announcement in your next issue that the 1912 meet will be held in Columbus, O., and conducted by the Columbus Motorcycle Club on July 17, 18, 19, 20 and 21, the first business meeting to be held at 9 in the morning of Thursday, July 18th, at the Virginia hotel. I kindly ask you not to overlook making mention to this effect.

Yours very truly,
G. H. HAMILTON,
President, F. A. M.

New York City, May 15, 1912.

The Tentative Programme.

The details of the programme have not been worked out fully as yet, and are in the hands of the Columbus Motorcycle Club. The following tentative programme has been submitted to the directors of the F. A. M. for their approval:

Wednesday—Reception of riders and delegates at headquarters in Virginia hotel. At 8 in the evening, reception and smoker at the clubhouse of the Columbus Motorcycle Club.

Thursday—At 9 in the morning, first business session in hotel parlors. At 10 in the morning, parade of riders through Columbus. At 2 in the afternoon, business session. At 8 in the evening, entertainment of riders and delegates, including lunch and refreshments, at motordrome.

Friday—At 10 in the morning, business session. At 2 in the afternoon, races at motordrome. At 8 in the evening, visit to Olentangy park.

Saturday—At 2 in the afternoon, races at motordrome.

Sunday—At 2 in the afternoon, races at motordrome.

Amendments to Constitution.

Conforming to the constitution of the F. A. M., President Hamilton makes official announcement of proposed amendments to the constitution, in order that they may be acted upon at the convention, as follows:

First—That the first clause of section 1 of article III of the constitution, which now reads: "There shall be held between June 15th and Sept. 15th of each year a national assembly of the F. A. M., at such time and place as the board of directors may decide upon * * * * *", shall be changed to read as follows: "There shall be held between Nov. 15th and Feb. 15th of each year a national assembly of the F. A. M. at such place and time as the board of directors may decide upon * * * *".

Second—The following addition to article III of the constitution, to be known as section 3 shall be added thereto, to read: "Section 3. There shall be held between June 15th and Sept. 15th

New Swenson Building, Providence, R. I., the Future Home of the Providence Motorcycle Club as Well as of B. A. Swenson, Rhode Island Agent for Indian Machines.

SERVICE AND RELIABILITY

For his third tour around the world, which began May 10, F. G. Koegel selected the sturdy Emblem, because his investigation led him to believe that no other mount would perform the task with the same degree of comfort and reliability.

Hundreds of owners can testify to the satisfactory performance of the sturdy Emblem under all sorts of road, weather and climatic conditions. It is built for service and reliability and always makes good.

Get an Emblem today and learn just how enjoyable real motorcycling is.

Write Dept. D for Catalogue and Descriptive Literature. If Not Represented in Your Territory Ask for Agency Proposition.

Also Makers of the Famous Emblem Bicycles.

ANGOLA **ERIE COUNTY** **NEW YORK**

in each year a national F. A. M. championship race meet, at such time and place as the delegates at the annual meeting of the national assembly shall decide."

Third—That the clause in section 1 of article VIII of the bylaws, which now reads: "Between the dates of June 15th and Sept. 15th" shall be changed to read: "Between the dates of Nov. 15th and Feb. 15th."

Fourth—That the following addition be made to article VIII of the bylaws, to be known as section 3: "There shall be held between the dates of June 15th and Sept. 15th of each year a national F. A. M. championship race meet, at such time and place as the delegates at the annual meeting of the national assembly shall decide."

These proposed amendments are signed by J. A. Hall of 322 East 22nd street, Brooklyn, N. Y., who maintains that these changes are absolutely necessary for the future welfare of the organization. He holds that with the rapid growth of the F. A. M. comes the growing importance of business matters which should receive the careful consideration of every member and every delegate representing other members. As these matters grow in importance, he thinks the seven or eight men who comprise the board of directors should not be called upon to decide them for a membership of nearly 15,000.

Mr. Hall suggests that the winter meeting might be held during the progress of the New York or Chicago shows. Inasmuch as no pleasure events would be held in connection with these meetings, under his plan, excepting a possible banquet, he believes that the delegates, elected by the clubs and with their expense borne by the clubs, would be able to give their undivided attention to the business before them.

Championship Races.

Inasmuch as the national meet is to be held on a board track this year the board of directors has made provision in the competition rules as follows:

"Be it resolved by the board of directors that: Being in favor of having the professional championship events run off at the national meet, we therefore resolve that there be competed for at the national meet

three professional championships for the distance of five, 10 and 25 miles; that the winners of these events shall be known as the national professional motor-

S. A. Flamm, Philadelphia Agent for Emblem, After His Collision with Touring Car.

cycle champions of America for the distances stated, and that for each championship there shall be awarded three medals consisting of gold, silver and bronze for the value of $50."

Providence Club's Picture Run.

The annual picture run of the Providence Motorcycle Club, Providence, R. I., which has come to be recognized as one of the principal events in the New England states, will be held May 26, clubs within a radius of 75 miles being invited to attend. Arrangements are being completed with a moving picture company to take the views this year, and this is expected to prove an added inducement for the various clubs to be well represented. The plan should meet with the hearty approval of the F. A. M., as by this means the growing importance of the motorcycle will be shown all over the country, wherever moving picture houses are maintained.

The club headquarters in the new Swenson building, Blackstone and Broad streets, will be ready for inspection May 26, although the members of the club do not expect to be settled until Memorial Day. An accompanying illustration presents the exterior of the building, the view being taken before it was actually completed. Motorcyclists' Rest, as the new clubhouse is to be known, will occupy the second floor on the left of the picture.

The Sturdy Emblem.

One of the claims made by the Emblem Manufacturing Company, Angola, N. Y., maker of Emblem mounts, is that its product is sturdily constructed. An accompanying illustration shows one of these machines in the hands of Samuel A. Flamm, the Philadelphia agent, immediately after its collision with a touring car. Mr. Flamm writes as follows concerning the accident:

"This machine I was riding myself when the accident occurred. A big touring car got in my road and I tried to push it aside. You can see what happened. As to myself, I came off lucky, and the machine as you can see is very little damaged, only bending the forks. The motor and the control were as perfect as the day they came out of the factory. The forks do not show a fracture, but a clean bend. I was going at a fairly good clip and everyone I show the forks to says they do not understand how it was the machine did not suffer more than it did. This, of course, shows the sturdiness of the sturdy Emblem. In fact, I am proud of the Emblem."

Rhode Island Club Activities.

At the regular meeting of the Rhode Island Motorcycle Club, Providence, R. I., May 20, steps were taken toward securing new clubrooms near the centre of the city. The list of officers for the ensuing year was completed by the election of the following committee members: Competition committee, J. C. Hyllstead, W. E. Johnston and Vernon Speere; entertainment committee, J. C. Loftis, H. G. Baxter and A. Fazzi.

May 19, the members of the club took part in a run to Cliftondale, Mass., the flying field of the New England Aviation Company, of which Harry Atwood is the head. One of the club members, Harry Jones, who formerly rode a Merkel, is flying a Wright biplane, having already made some 15 flights. Jones is fast becoming an experienced aviator, controlling his own machine, although the instructor still goes with him to see that nothing happens. He expected to give his fellow club members an exhibition of his ability along this line, but the weather would not permit him to do so.

May Compete in Canada.

After consultation with President Hamilton of the F. A. M., it has been decided that the chairman of the competition committee will permit without further formality, all members of the federation to compete in Canada under sanction issued by the Canadian Motor-

Donald Johns, Well Known Racing Rider, and His Indian.

cycle Association, and all members of that association will be permitted to compete in the United States under F. A. M. sanction upon presenting to the referee

Digitized by Google

a card showing that they are members in good standing of the C. M. A. This permission is issued with the understanding and belief that the rules of competition of the C. M. A. will be similar to those of the F. A. M., and particularly with reference to the matter of allowing profesionals and amateurs to compete against each other.

Around the World on Emblem.

May 10, F. G. Koegel, who holds the world's record for walking around the world, and has made a second trip of the same nature on a bicycle, left Angola, N. Y., on an Emblem motorcycle, made by the Emblem Manufacturing Company of that city. The machine is rated at seven horsepower. He expects to complete the task within six months.

Rockford's Hill Climb.

The annual hill climb of the Rockford Motorcycle Club, Rockford, Ill., was held early in the month, the course measuring about one-half mile. The summary follows:

Twin-cylinder machines—First, H. Pearson, Merkel; second, C. Swanson, Harley-Davidson; third, Fay Young, Merkel; fourth, Ralph Olson, Indian; time, 0:24.8.

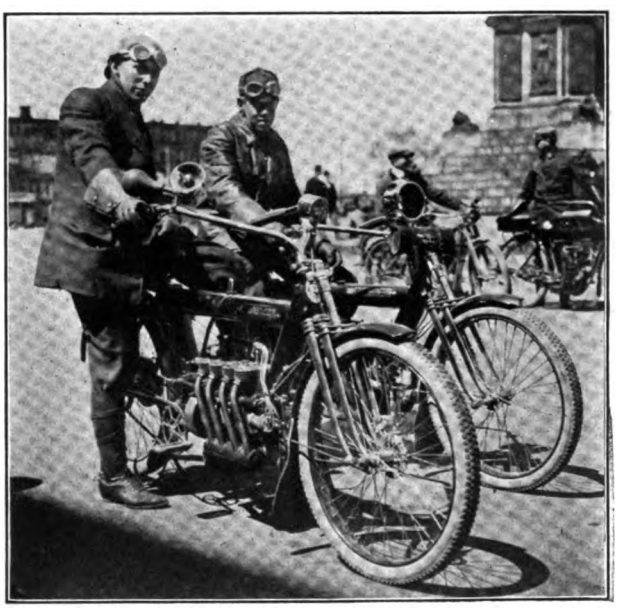
Single-cylinder machines—First, H. Jacobson, Harley-Davidson; second, H. Samuelson, Harley-Davidson; third, D. Erickson, Harley-Davidson; time, 0:32.

Perfect Scores in San Diego.

Thirteen of the 15 riders to start in the 386-mile endurance trial of the Motorcycle Club of San Diego, Cal., finished with perfect scores as follows: Clyde Elmer, P. M. Frazen, Henry Burkhardt, S. W. Dobson, C. F. Bruscki, Ray Smith, W. O. Borned, J. E. Dobson, Max Toews, James Urquhart, Dallas Keerer, House Walter and Edward Schmidt. Ten Indians, one Harley-Davidson, one Thor and a Pierce were the machines.

Hill Climb in Georgia.

The results in motorcycle classes at the annual hill climb of the Atlanta Automobile Club at Atlanta, Ga., May 11, were decidedly in favor of the two-wheeled mount, as compared with the racing motor cars. The summary follows:



Stock machines, 30.5 inches—First, Doyle Mayfield, Indian; second, D. K. Campbell, Indian; third, R. O. Miller, Merkel; fourth, A. S. Williams, Indian; time, 1:13.2.

Stock Machines, 61 inches—First, H. Swanberg, Indian; second, A. C. Meixell, Indian; third, M. T. Burke, Indian; fourth, L. E. Kamper, Indian; time, 0:54.6.

Professionals, 61 inches—First, H. J. Glenn, Indian; time, 0:53.6.

Whitney Resigns.

P. B. Whitney of Chicago, vice president of the Lake District, F. A. M., has handed his resignation to President G. H. Hamilton. This action was not voluntary on Mr. Whitney's part, as he has been one of the most enthusiastic workers in the Middle West. His business as manager of the Chicago branch of the Hendee Manufacturing Company, Springfield, Mass., maker of the Indian, will not permit him to continue in office longer. In retiring from active work for the federation it is only fair to state that the organization has lost one of its best officials, and one upon whom it was fondly expected that the honor of president would be conferred at some time.

Earl Smith and Hollenbeck of Pawtucket, R. I., and Their Seven Horsepower Pierce Mounts.

Results in Lynn.

Eight of the 16 riders taking part in the endurance run of the Lynn Motorcycle Club, Lynn, Mass., May 12, finished with perfect scores. The distance

was about 140 miles, covering the triangle course from Lynn to Worcester, to Providence and return. The perfect score men and their machines were: Edward Haines, Harley-Davidson; H. Feeny, Harley-Davidson; A. B. Madison, Harley-Davidson; Lawson, Indian; Bryant, Harley-Davidson; Harry Phelps, Harley-Davidson; Shattuck, Indian; Lockwood, Indian.

Stadium at Brighton Beach.

According to advices from New York City plans are completed for the construction of a motorcycle stadium at Brighton Beach, L. I., near Coney Island. Thirty thousand dollars will be expended in the undertaking, it is stated, and it is expected that New York will prove as much interested in racing as Los Angeles, Chicago and other cities where the scheme has been given a trial.

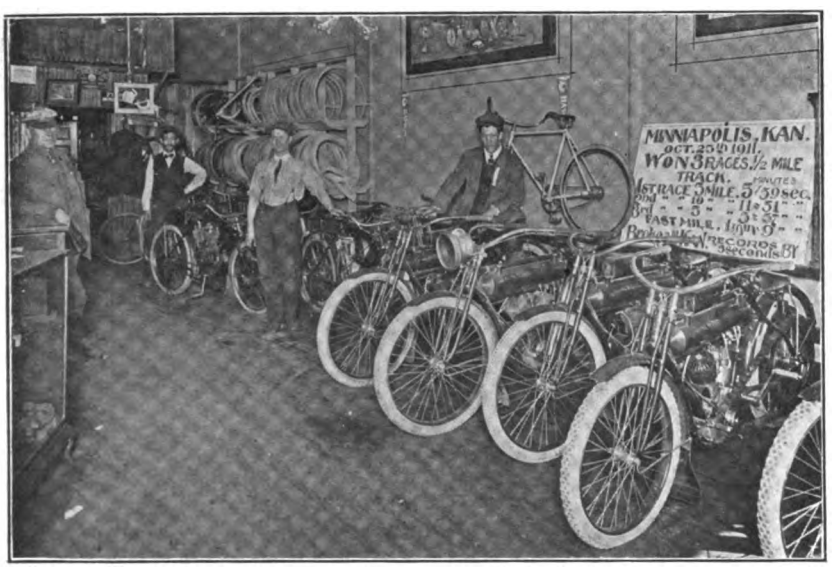
Race Meet in South Carolina.

The first race meet of the Columbia Motorcycle Club, Columbia, S. C., was held on the afternoon of May 10. The events were well attended, and the club plans a repeat performance for July 4. The results follow:

Three miles novice—First, Leon Williams, Indian; second, F. S. Habenicht, R-S; third, H. F. Peterson, Indian; time, 3:49.2.

Five miles, open—First, Leon Williams, Indian; second, F. S. Habenicht, R-S; third, H. N. Snaverley, Indian; time, 6:17.2.

Twenty miles, private owners and trade riders—First, H. N. Snaverley, Indian; second, Leon Williams, Indian; third, M. C. Spears, Indian; time, 25:58.8.



Five miles, miss and out—First, H. L. Davis, Indian; second, H. N. Snaverley, Indian; third, Leon Williams, Indian; time, 7:41.

Franchise for Riverview.

The board of directors of the F. A. M. has authorized Dr. J. P. Thornley, chairman of the competition committee, to issue a restrictive franchise for a board track to William M. Johnson of the Riverview motordrome, Chicago. Dr. Thornley also has been authorized to procure badges for the official referees.

Energetic Merkel Agency.

An accompanying photograph shows the interior of the agency maintained by Newby Bros., at Kansas City, Mo. The concern is agent for Merkel machines, made by the Miami Cycle & Manufacturing Company, Middletown, O., and also has a branch establishment in Topeka, Kan. One of the brothers, Clarence, was a recent visitor to the Merkel factory and stated that more machines of that make had been sold in Kansas City and Topeka than of any other. Without doubt this has been due largely to the energetic action of this concern.

Interior of the Merkel Agency Maintained in Kansas City, Mo., by Newby Brothers.

Club Notes Here and There.

The Hobart Motorcycle Club, Hobart, Ind., has become affiliated with the F. A. M., bringing in 15 members. The secretary is W. E. Corr, and his address, P. O. Box 166. The club is numbered 263.

Warren, O., has some 50 riders, whom W. Cooper of 96 First street is endeavoring to bring together and organize into a club.

Walter A. Good of Ashland, O., is working up sentiment in favor of organizing an affiliated club in his vicinity.

Some of the objects of the newly organized Lawrence Motorcycle Club, Lawrence, Kan., are to awaken wider interest in motorcycling, to enforce suppression of the objectionable open muffler, to arrange for pleasure runs and to co-operate with the automobile interests in securing good roads.

Erwin Keller has been elected vice president of the Topeka Motorcycle Club, Topeka, Kan., in place of George Roberts, resigned.

The Fulton County Motorcycle Club, Gloversville, N. Y., is advocating legislation for uniformity of laws governing the speed of motorcycles throughout that state.

The Motorcycle Club of Santa Cruz, Cal., is planning a race meet to be held at the new amusement park now being constructed at Opal.

The Harlem Motorcycle Club, New York City, has elected the following officers for the ensuing year: President L. H. Guterman; vice president, Daniel J. Willis, Sr.; secretary, D. J. Willis, Jr.; treasurer, David Epstein; captain, Arthur C. Bergenstein.

The Aberdeen Motorcycle Club has been organized at Aberdeen, Wash., with 19 charter members. The following officers have been elected: President, M. O. Adams; vice president, Harry Prentice; secretary, Leon McNeal; treasurer, R. E. Barnes.

Digitized by Google

Twenty-two riders in Burlington, Ia., recently organized the Hawkeye Motorcycle Club with the following officers: President, T. Field; vice president, George Swan; secretary, E. C. Marquard; treasurer, Joseph Miller; captain, George Hartman; first lieutenant, Leo Masters; second lieutenant, Harry Mauthe.

Indians Lower Records.

New attempts to lower existing records were made by Indian riders on the Los Angeles track May 17, Ray Seymour creating new professional marks from one to 21 miles, his oil giving out on the 22nd mile, and Claflin reducing the amateur time from one to 17 miles, inclusive. The marks exceeded were set by Excelsior riders April 19, with the exception of the professional record for one mile, and the amateur for 15, 16 and 17 miles, the new and old figures being given as follows:

World's Professional Records.

		Old	New

NEW FORD PLANT.

The Ford Motor Company, of Detroit, is still further extending its system of branch assembling plants, and has made plans to establish a station in Milwaukee, Wis. The Courteen block in that city has been leased and shortly will be occupied by the Ford people. Parts will be shipped to Milwaukee by water.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

COVERT MOTOR VEHICLE CHANGES.

A change has taken place in the sales offices of the Covert Motor Vehicle Company, Detroit. C. C. Hinkley, the sales manager, recently resigned to go with the Chalmers Motor Company, and has been succeeded by N. Gould Allen, who was for sometime secretary of the Harrison Radiator Company, Lockport, N. Y. Mr. Allen will handle both the sales of the Covert company and the Harrison radiator from the one office, 1422 Ford building, Detroit.

MAINE TO REPAIR ROADS.

During the past few years Maine has been seeking its full share of the motor touring in New England, and as the result of a recent conference of state officials in Portland, the road between Bridgton and Fryeburg will be put in condition immediately. The cost of this work is estimated at between $10,000 and $15,000, part of which will be paid by the two towns, according to the new law. This will place one of the main arteries of travel to the White mountains in usable condition, the part in New Hampshire being in fine shape. With the repairing of the portion in Maine, there will be an excellent road from Bretton Woods, in the heart of the White mountains, to Portland, by way of Poland Spring.

Other important stretches are to be improved. Highway Commissioner Hardison has reported that surveys have been completed for building 7000 feet of road between Biddeford and Kennebunk, which will repair the worst of the road through the Kennebunk woods. Three miles of road through Wells also has been surveyed for repair, and over two miles in York. The road through Kittery is to be resurfaced and the route from Ogunquit to Cape Neddick entirely rebuilt. The governor has expressed approval of the plan of placing the new roads in the care of patrols which would cover daily a certain number of miles and make minor repairs before the breaks become extensive. This system is to be employed by New Hampshire.

GOOD MARKET IN TEXAS.

In contrast to the poor prospects for motor car sales in the Mississippi valley, where the floods have wreaked havoc, comes the reports of good crops in Texas and consequently prospects of a large sale of cars in that state. Glowing reports of the conditions of the crops have come in from every section of the state, with a wheat production of 18,000,000 bushels expected and an oat crop of 50,000,000 bushels. Corn was set back by early rains, but now promises good. Cotton will be produced to the total of 4,000,000 bales, it is said. Aside from crop condition, one of the most promising indications of a good market for automobiles is seen in the interest the farmers are taking in the machines, sales increasing rapidly.

Eastern Motor Racing Association, East Orange, N. J.; to manufacture automobiles and motorcycles; $50,000; incorporators, H. H. Picking, C. O. Geyer, F. E. Ruggles.

Ford Auto & Truck Company, Inc., Clarendon, Va.; $25,000; incorporators, E. H. Bauer, W. W. Barnes, R. Gordon Finney.

Hassett & Rogers, Inc., Amesbury, Mass.; $18,000; to manufacture automobile bodies; incorporators, J. H. Hassett, C. H. Hassett, G. H. Collins.

North Jersey Auto Supply Company, Inc., Newark, N. J.; $80,000; incorporators, Max Permission, 525 18th street, Newark; A. C. Mohrof, C. G. Butler, F. W. Mead.

Broadway Penn Garage, Inc., Brooklyn, N. Y.; $2000; incorporators, Herman Goldstein, 181 Penn street, Brooklyn; Meyer Kaplan, Hyman Maisel.

Gressler Aviation Company, New York City; $25,000; incorporators, W. Romain Gressier, 139 W. 37th street, New York City; W. R. Kip, Gerardus P. Herrick.

Briggs Oil Company, Long Beach, Nassau country, N. Y.; $1500; to deal in oils and greases; incorporators, William S. Driggs, Long Beach; Abraham Lodholz, Henry J. Frink.

WITH THE MANUFACTURERS.

C. C. Hinkley has joined the Chalmers Motor Company, Detroit, as chief engineer, having left the Covert Motor Vehicle Company, Lockport, N. Y. He has had considerable experience in the automobile industry having been with the Olds Motor Works and the Owen Motor Car Company.

The Continental Motor Manufacturing Company, Detroit, has erected what is claimed to be the largest factory building in the world devoted to the manufacture of motors for automobiles. It is located near the plant of the Hudson Motor Car Company, and cost approximately $1,000,000. The capacity of the company, which has been given as 18,000 motors annually, is to be doubled when the new structure is in full operation. The total floor space is 240,000 square feet, the building covering 12 acres. The present plant at Muskegon, Mich., is to be continued in addition to the new one at Detroit.

A. R. Mosler & Co., has moved to new quarters at Webster and Wakefield avenues, Yonkers, N. Y., where a new factory and office buildings give more space and greater facilities. The factory is in a pleasant environment and is equipped with the most modern machinery.

The Goodyear Tire & Rubber Company, Akron, O., has placed the Cleveland and Toledo, O., branches in charge of the Detroit manager, E. F. Jackson, who also has charge of the branch in Grand Rapids, Mich. C. W. Holcker has been made local manager of the Detroit establishment.

The F-S Motors Company, Milwaukee, Wis., is manufacturing the F-S light delivery car in its large auxiliary plant at First and Oklahoma avenues, using Beaver motors and Weston-Mott rear axles.

The Goodyear Tire & Rubber Company, Akron, O., has made a number of changes in its sales organizations, as follows: William M. Boggs, formerly at Philadelphia, is now in charge of New Jersey territory; H. G. Bruning is taking care of motor truck sales in Cleveland, O.; F. H. Findlay has been transferred from the New York branch to Brooklyn with J. B. Linerd, who will travel from Brooklyn for solid tires; H. B. Morton, Chicago, has been placed in charge of Illinois territory in place of H. L. Lawson, with R. H. Campbell succeeding him in Chicago. New salesmen have been appointed as follows: H. W. Hoklas, Minneapolis; D. H. Cottrell, Buffalo; R. S. Grant, Cleveland; I. S. Roberts, eastern Missouri.

The Hyatt Roller Bearing Company, Detroit, has issued in booklet form reproductions of its advertisements, and is distributing the booklets to the sales and advertising managers of automobile concerns handling cars equipped with Hyatt roller bearings, in order to furnish them with selling arguments.

The United States Motor Company has taken new European headquarters in London at 212-14 Great Portland street. A five-story building has been secured and

Five-Story Building in London Occupied by the International Motors, Ltd., the European Branch of the United States Motor Company.

is occupied by the United International Motors, Ltd., as the foreign affiliation of the American concern is called.

D. F. Poyer & Co., maker of Menominee trucks in Menominee, Mich., has purchased the Gram factory buildings, the present facilities being too small. During 1912 a total of 300 cars is to be made.

The Kilgore Manufacturing Company, Boston, has moved into larger offices at 883 Boylston street. The Air shock absorber which the company manufactures has been improved, and may be had in a number of finishes to match any car, and in large sizes for trucks, as well.

The Hartford Suspension Company, Jersey City, N. J., is shortly to place on the market a new spark plug. No details of the plug have been made public, but it is stated that it will be of the two-piece type.

The Ross Gear & Tool Company, making truck steering gears in Lafayette, Ind., is to erect a new factory

Digitized by Google

on North Eighth street, which will give it 50,000 square feet of floor space.

The East Aurora Motor Car Company has been organized in East Aurora, N. Y., with a capital of $8000 by A. L. Pierce, M. B. Paxon and Winfield S. Wilson. It is stated that automobiles will be manufactured.

H. A. Worman, formerly with the National Carbon Company, Cleveland, O., as advertising manager, has joined the Baker Motor Vehicle Company in the same city and taken charge of the advertising department.

The Fisk Rubber Company, Chicopee Falls, Mass., has opened a new Pacific Coast headquarters in San Francisco, on Van Ness avenue. The building is two stories high, of reinforced concrete, and contains, besides the salesrooms and offices, a complete service department for repairs and vulcanizing.

The Kissel Motor Car Company, Hartford, Wis., has leased a large four-story building at the corner of 26th and Wabash avenue, Chicago, and now occupies in that building nearly 100,000 square feet of floor space, the largest devoted to the automobile business in the city. The building has been turned into a model service station.

The Great American Rubber Company, Conshohocken, Penn., has appointed the following agents: Seldom Motor Car Company, Houston, Tex.; E. S. Sporting Goods & Auto Supply Company, Athens, Ga.; J. B. McClelland, Sault Ste. Marie, Mich.

The Mack Bros. Motor Car Company, Allentown, Penn., has purchased six acres of ground adjoining the plant and will erect an addition.

The Miller Carburetor Company of Los Angeles, Cal., has decided to move to the Middle West, and has taken temporary quarters in Indianapolis, where the company will be closer to the industry.

GARAGE AND DEALER.

W. R. Campbell, who recently purchased the West machine shop in Evart, Mich., is having it torn down and is to erect a modern concrete garage. Several men will be employed, and the establishment is expected to be completed in time to care for the summer tourists.

Harry Baker of Cleveland, O., has become manager of the E. Stewart Automobile Company, San Francisco, handling S. G. V., Marquette and Crawford cars in northern California.

Tri-City Auto Supply Company recently opened in Rock Island, Ill., at 319 Nineteenth street. The company is the only exclusive supply house in the locality, and carries a full line of accessories.

Kiel & Evans, Oakland, Cal., has taken the agency for the Commerce truck, made by the Commerce Motor Car Company, Buffalo, N. Y.

The American Auto Company is the latest automobile concern to open in Davenport, Ia., handling the American underslung at 211 East Second street. Salesrooms and a garage have been opened.

Paul R. Pels has taken hold of the management of the Benz Auto Import Company, filling the vacancy left by the resignation of Jesse Froelich, who still retains his interest in the company.

F. W. Johnson is to open a new garage in Fulda, Minn.

Stafford Noble has bought the St. Mary's Auto Garage, St. Mary's, O., from August Schierenbeck.

The Orland Garage, Orland, Cal., has been purchased by Thomas and Roscoe Scribner.

Bunn & Goembel is a new firm that has opened a garage in Pipestone, Minn.

The Twyman Motor Car Company, Columbus, O., agent for the E-M-F and Flanders, has opened a branch in Dayton, O., at 224 North Main street. This will enable the company to handle the local Dayton business to a better advantage than formerly, and also give improved service to the dealers in Montgomery and surrounding counties.

H. R. Polk, Des Moines, Ia., has purchased the automobile business of the Cunningham Automobile Company from William R. Cunningham and will hereafter conduct it under the name of the Central Iowa Motors Company, handling American and Hupmobile cars for the state.

The Hub City Vulcanizing Works has been established in Sheboygan, Wis., by George N. Putnam and M. Bachanz.

William R. Cunningham, who sold the American Automobile Company, Des Moines, Ia., to H. R. Polk, is to establish a second hand car business under the name of the Western Automobile Clearing House, in connection with which he will operate a garage and repair shop.

The Sterling Motor Car Company, Indianapolis, Ind., has moved into new quarters at 320-322 North Delaware street, where it is better able to display its line of Paige-Detroit and Firestone-Columbus cars. The change was made necessary by the rapidly increasing business of the company

W. S. Sanderman, known as "Sandy" to his many friends in and around Boston, has started in business again, having opened a garage at 59 Boylston street, Cambridge, near Harvard square.

The Knickerbocker Motor Car Sales Company, which was recently organized with W. M. Botto, formerly of the Abbott-Detroit Motor Company of New York, as general manager, is handling the Havers Six-44 in one of New York's finest salesrooms, in the Winter Garden building. The company is the sole distributor for the Havers cars for eastern New York and Fairfield county, Conn.

The Alexandria Garage has been opened in Amityville, N. Y., by Richard G. Evento, at Bayview avenue and South County road.

Charles Chance, Eastport, Me., has purchased some water front property and intends to remodel it into a garage which he will conduct in connection with his launch business.

Benjamin Ward, Brockton, Mass., has expanded his repair shop on Clinton avenue by the addition of a complete welding and brazing equipment.

G. W. Jocelyn has purchased the tire repair shop of J. A. Peltier & Sons, 471 High street, Holyoke, Mass., and is conducting it in conjunction with his bicycle business.

Charles E. Ball is the latest addition to the automobile supply houses of Newark, N. J., having opened a store at 351 Halsey street.

A. B. Craven, Kellogg, Ia., is to handle the Maxwell and Case cars, and is building an addition to the Holdsworth Wagon Shop in which he will house the two lines.

Floyd Ellet, Mediapolis, Ia., has opened a garage and repair shop and is carrying a line of supplies, as well as operating a vulcanizing plant. He is located in the building formerly occupied by Johnson's livery stable.

The Atchison Motor Company, Atchison, Kan., has been formed by E. J. Donnelly and W. Y. Alkire, and has just taken possession of a modern garage at Ninth and Commercial streets.

Claude Younger, Louisville, Ky., has taken the agency for the E-M-F and Flanders. A salesroom and office have been secured at 916 South Third street.

John H. Duffy has opened an establishment in New Orleans, La., where he is conducting a general automobile sales and repair business.

The International Motor Company, Baltimore, Md., is installing its equipment in the new five-story building at 30 South Hanover street, and will soon be ready for business.

Joseph B. Johnson, Tampa, Fla., has taken possession of the new garage and repair shop which he had built, and is now ready for business.

The Dale Taxicab Service, the first taxicab operator in Des Moines, Ia., has opened a new garage and has its fleet of machines in full operation.

The Chapman-Love Auto Company, Washington, D. C., agent for the King car, has secured permanent quarters at 1312 14th street, N. W.

D. H. Sloan & Son, Lakeland, Fla., has taken the agency for Penn, Case and Maxwell cars, and has opened a salesroom in the Peacock building.

E. E. Barry, Washington, D. C., is remodelling his granary at 13th and W streets into a garage. An electric elevator is to be installed, and the building will be equipped with the most modern improvements.

T. L. Jackson, the Washington, D. C., agent for Stevens-Duryea cars, has moved into new quarters at 14th and R streets.

F. L. Butman of Glendale, Cal., has moved to Pomona and opened an agency for the Metz car at 145 East Pearl street.

E. J. Montgomery, the Brooklyn, N. Y., agent for the Stutz, has moved his establishment, including the salesroom and service department, to 1289 Bedford avenue.

T. Earl Allaman, 4268 Olive street, St Louis, Mo, has been appointed manager of the Federal Tire Agency which was recently established in St Louis to succeed the Petty Tire & Rubber Company, the former agent for Federal tires.

AJAX TIRES

(GUARANTEED 5000 MILES)

Mean a Saving of 30%

The attention of car owners all over the country has been attracted by the remarkable showing of AJAX TIRES.

Their record for service and durability in the 1911 Glidden Tour has never been equalled by other tires and proves conclusively that the Ajax are the Leading Quality Tires for Touring.

Tires that make record trips and finish almost as good as new are the tires dealers find a profit in handling.

Wherever endurance contests have been held under actual touring conditions, AJAX TIRES have proven strongest and sturdiest.

There's a mighty big difference in brake lining, and this difference isn't apparent until the lining is used—

TRADE MARK Raybestos REG. U.S. PAT. OFF.

Gives greater efficiency—longer life than other linings. Every known test proves this statement.

Its foundation is asbestos—the toughest and most pliable substance known for brake lining. Second, it is made of best long fibre asbestos.

No low grade, short fibre asbestos is used nor is there any secret combination of other materials to serve as filling. Nothing more than selected long fibre asbestos goes into RAYBESTOS—nothing less comes out in the wear.

RAYBESTOS is the original heat-proof facing. By scientific weaving, rolling, sizing and treating, RAYBESTOS becomes a wall of strength, capable of resisting intense heat.

Ask your dealer for RAYBESTOS. Our trademark is stamped in every foot of the fabric.

We also manufacture Duplex and Raymond Brakes and Gyrex Mixer.

The Mile Away Electric

MOTOR HORN

Patented Sept. 5, 1911

Torpedo Type

PRICE

$20.00

Including Button and Cable

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS---A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times. When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

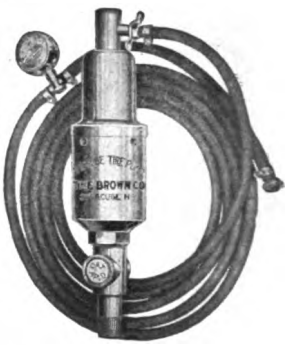
DISCARD THE HAND PUMP

Join the Satisfied Army. Get a



BROWN IMPULSE TIRE PUMP

Nothing to watch but the gauge. Built like your motor with grey iron cylinder and iron piston rings. Proper inflation means long life to your tires. You can't get it with a hand pump.

You're losing money and comfort every day you delay investigating. Your dealer knows the BROWN—if not write us.

THE BROWN COMPANY

1075 S. Clinton Street Syracuse, N. Y.

Patent Applied

"Look at the rear springs" if you want to know why some cars ride easier than others—why even one or two people can ride in comfort in a seven-passenger car.

It's because they are equipped with

"J. M." Shock Absorbers

insuring—despite rocks, ruts and bad roads—greatest comfort at high speed and *reduced* wear and tear on tires.

The term "shock absorbers" does not fully describe the "J. M."—they not only *absorb* all jolts and jars, but they actually *prevent* them by holding the rear wheels to the ground.

The unique construction of the "J. M." makes them perfect supplements to the rear springs of the car, preventing:

First, the "racing" of your engine, caused by the rear wheels leaving the ground;

Second, engine shocks and tire grinding caused by the car returning to the road with a thud.

Learn at our expense how to get the most comfort and longest service from your car—don't pay us a cent until the "J. M." Shock Absorbers prove our claims.

Made in three models—attachable in an hour, detachable in 15 minutes. **Prices, $35.00 to $50.00 per set.**

Write on your business letterhead for booklet D and full information. Mention the name, model, weight, and width of rear springs of the car you run.

The "J. M." Shock Absorber Co.

Main Office and Factory, 210 South 17th Street, PHILADELPHIA, PA.

Weed Anti-Skid Chains

One of the Most Remarkable Inventions in the History of the Motor Car Industry

A well known editor of one of the largest automobile papers thus expresses his views: "The fact remains that no other device will do just what *Weed Chains* will do. The Weed invention is one of the most remarkable in the history of the Motor Car industry. When first put upon the market, its *effectiveness* was self evident, but the skeptic said it would ruin tires and that something far better would be forthcoming. The fact is that it *constantly creeps and does not ruin tires* any more than the ordinary use of the tire—without the chains—wears it.

"*Another fact* is that Taxicab companies, who do everything that money can do to minimize accidents, universally use *Weed Chains* because *no other device at any price is equally effective.*"

When Used on the Front Wheels, Too

Weed Chains give comfortable, easy steering; no cramped fingers; no cramped arms; no sore muscles—out of car tracks, ruts, and "heavy going"—*just like steering on smooth roads.*

Even if you don't value your own life—what right have you to imperil the lives of others? *For your own safety*, for the safety of the public and other road users, fully equip you car with *Weed Chains* today.

Recommended and sold by all reputable dealers.

GASOLENE GALLON GAUGE

For Automobiles and Motor Boats.

For measuring the amount of gasolene in supply tanks.

The numbered markers are slideable and may be adjusted to show the number of gallons in any given tank whether it is square, round, oval or irregular in shape.

The depth of each gallon is the same in square sided tanks.

In round or oval tanks the depth of the gallons will be less towards the middle of the tank.

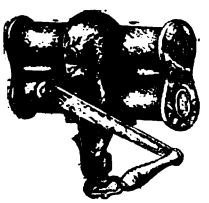
The outside level marker shown is to register the amount in the tank at any given time.

Handsomely finished in black stained wood, 15 inches long, with 20 brass markers.

If your tank holds more than 20 gallons, extra markers will be inserted as ordered.

Price 50 cents postpaid anywhere in the United States.

Send Express or Postoffice money order. Stamps accepted.



SPECIAL.

Extra long gauges made to order for very deep tanks; not more than 24 inches in length, with markers numbered from 1 to 30 as may be required.

Price 75 cents, postpaid anywhere in the United States.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

The Standardized Specialized Print Has 100% Value to READER and ADVERTISER

Despite Flamboyant Statements by Publishers, Despite Criticism by Their Representatives, It Is an Uncontroverted Fact That the Only Motoring Magazines to Gain in Advertising Patronage During 1911 Were Three Specialized Publications.

Of These Three the AUTOMOBILE JOURNAL Was Second. All Others Showed a Loss.

Aside from Service Wagon Magazines, Promotive of Highway Transportation, Only Owners' Prints Made a Gain.

Those That Lost Heaviest Were Generally the Oldest Established.

The Contents of Any Magazine Is the Basis by Which to Judge Its Merits, Its Policy, and the Character of Its Readers.

The Magazine That Is Devoted to Any One Class of Readers Must of Necessity Be Specialized. It Requires Years of Endeavor to Obtain Recognition. Only Value of Contents Can Retain Subscribers and Advertising Patronage.

All Successful Publications Are Recognized by Positively Established and Clearly Defined Policies. Changes Are Evidence of Weakness or Failure. To Gain a New Clientele Must Necessarily Mean the Sacrifice of the Old.

The AUTOMOBILE JOURNAL Is Promotive of the Use of the Pleasure Motor Car. Its Readers Are Owners.

The MOTOR TRUCK Is Promotive of the Service Wagon and Its Utility. Its Readers Are Business Men.

The ACCESSORY and GARAGE JOURNAL Is Devoted to the Motor Vehicle Industries and the Trade Generally. It Is a Trade Print for the Manufacturer and the Trade.

AUTOMOBILE JOURNAL PUBLISHING COMPANY

VOL. XXXIII. No. 9

AUTOMOBILE JOURNAL

$1.00 the Year.
10 Cents the Copy.

PAWTUCKET, R. I.

June 10, 1912

Who recommended your lubricating oil? *That is vital.*

AUTOMOBILE lubricants are like automobile parts.

They must fit the car they are used on.

The correct oil cannot be determined by simple tests. Most motorists must depend on advice.

Dealers who handle Gargoyle Mobiloil can give you the specific recommendations of the Vacuum Oil Company—the recognized leaders in lubrication.

We supply them with a guide chart. The chart was prepared after a careful analysis of every American car and practically every foreign make. It will show you the correct grade of lubricating oil for your car (summer and winter). A copy will be sent you on request.

In power-engineering circles these recommendations from us would be accepted as authoritative. You may feel assured that, in quality, the oils specified on the chart set a world standard.

They are put up in barrels, half-barrels, and in 5 and 1 gallon sealed, white cans.

The oils (refined and filtered to remove free carbon) are named:

Gargoyle Mobiloil "A."
Gargoyle Mobiloil "B."
Gargoyle Mobiloil "D."
Gargoyle Mobiloil "E."
Gargoyle Mobiloil "Arctic."

All are branded with the Gargoyle which is our mark of manufacture.

Mobiloil

A grade for each type of motor.

If oil saves power, it follows that one oil saves more power than another.

VACUUM OIL COMPANY, Rochester, U. S. A.

1912 Annual Catalog No. 22

Our 1912 Catalog, the Largest and Most Complete Catalog of the kind, containing 256 Pages, is Now Ready for Distribution. The Circulation is Limited to ONE HUNDRED THOUSAND Copies. It will be mailed to any one on request.

CUT PRICES

Concerns that offer Large Discounts make it their practice to INFLATE LIST PRICES and then offer Large Discounts, which are somewhat misleading. We have seen a catalog in which a certain spark plug is illustrated, "PRICE $2.50, OUR PRICE $1.00," while THE STANDARD LIST or RETAIL PRICE for the same spark plug as illustrated in Our Catalog and advertised by the manufacturer is $1.00 each. Their CUT PRICE Therefore Is Not Lower Than OUR LIST PRICE.

DON'T BE DECEIVED BY LARGE DISCOUNTS QUOTED FROM INFLATED LIST PRICES . . . .

Model EE—5 Passenger Touring Car—110 Inch Wheelbase

R-C-H

DEALERS who are considering the contract question for the coming season will do well to note carefully the construction and equipment details of the R-C-H.

For the measure of a dealer's success is the number of people he can satisfy with the car he sells.

And the R-C-H covers, far more completely than any other car at near its price, every requirement of the average motorist.

If you will think over what your own customers require in a car, you will see that this is so.

"Twenty-Five"

TOURING CAR—Model EE

$900 F. O. B. DETROIT

32 x 3½ tires, demountable and quick detachable rims, extra rim, Bosch magneto, gas tank, windshield, lamps, horn, tools and kit; and the famous Jiffy Curtains, adjusted in an instant, making the car entirely weather proof. Long stroke motor, three speeds, enclosed valves.

STANDARD MODEL

$850 F. O. B. DETROIT

Top, windshield, generator, Jiffy curtains, 5 lamps, horn, tools and tire repair kit, long stroke motor, three speeds, enclosed valves, Bosch magneto.

ROADSTER—Model EE

$750 F. O. B. DETROIT

Specifications and equipment same as Model EE Touring Car except that wheelbase is 86 inches.

STANDARD MODEL

$700 F. O. B. DETROIT

Specifications and equipment same as Standard Model Touring Car, except that wheelbase is 86 inches. The Roadsters are roomy, comfortable and exceptionally easy to handle in narrow roads.

General R-C-H Specifications

Motor—4 cylinders, cast en bloc—3 1-4 inch bore, 5-inch stroke. Two-bearing crank shaft. Timing gears and valves enclosed. Three-point suspension. **Drive—Left-side.** Irreversible worm gear, 16-inch wheel. **Control—Center lever** operated through H plate, integral with universal joint housing just below. **Springs**—Front, semi-elliptic; rear, full elliptic and mounted on swivel seats. **Frame**—Pressed steel channel. **Axles**—Front, I-Beam, drop-forged; rear, semi-floating type. **Body**—English type, extra wide seats. **Wheelbase**—110 inches. Full equipment quoted above.

OUR output for the coming year—30,000 cars—will enable us to provide for a country-wide distribution—something we were unable to do with a smaller production this season.

In every county there are prospective R-C-H buyers. It is pre-eminently "the greatest car for the greatest number." It will interest more classes of people than any other car we know.

So we urge that dealers everywhere get in touch with us at once. With R-C-H quality, price, factory co-operation and publicity back of him, an aggressive dealer should find the R-C-H representation the most successful of his career.

A KIND OF COMPETITION WHICH HURTS EVERYBODY

NO reputable manufacturer condemns honest competition. He has only kindly feeling for a worthy competitor whose activity puts zest into the race for business.

Honest competition benefits everybody. It safeguards quality, regulates prices and promotes sales, helping thereby the consumer, the dealer and the manufacturer.

There is another kind of competition which comes out of the gutters of the business world and is obnoxious and harmful to everybody.

It is based on a falsehood and fostered under the protection of a misappropriated trade name.

It is the competition of imitators, who misappropriate to their own use the name of a standard product.

NON-FLUID OIL is a name which instantly inspires confidence in the motorist who is considering lubricants.

It is a name which for fifteen years has been a standard of quality for lubricants.

It is a name which the trade recognizes as the exponent of a tremendous demand in the motoring world.

But it is a name which is outraged by imitators who unload their low grade lubricants under its protection.

Your confidence, Mr. Dealer, is betrayed when you are induced to stock an imitation of NON-FLUID OIL. You need not look beyond the price you are asked to pay to be convinced that you cannot offer your customers quality in these cheap impostures. A request for NON-FLUID OIL is inspired by a comfortable feeling of security. It knows no doubts or misgivings. The confidence of your customer is betrayed if he is sold anything but the genuine product.

You are told, Mr. Motorist, by over seventy manufacturers of motor cars that NON-FLUID OIL is the most efficient and most economical lubricant you can use. All generations of motor cars have been lubricated with this product. You want it, but you must be sure of its genuineness, because of numerous imitations which even your dealer may sell you without knowledge of the deception.

This concerns you vitally, Mr. Car Owner

The next time you purchase lubricants ask for NON-FLUID OIL, but see that you get the orange colored can; be sure it bears the registered trade mark

TRADE MARK NON-FLUID OIL REGISTERED IN UNITED STATES PATENT OFFICE

and that it shows the name of the

National

Wins 500-Mile International Sweepstakes Race

Time, 6 hours, 21 minutes, 6 seconds. Average 78.72. miles per hour

Lowers record by 4.11 miles per hour.

From the Factory thro' the Race-Test Comes the National Car You Sell

Seven Passenger Touring Car

What this Race Proves to Dealers

THE most popular and talked about car to day is the National. Thousands upon thousands of people will look for National dealers, because they are eager to see and ride in the car that has again demonstrated its superiority over all others.

A dealer can rise no higher than his car—and a car can rise no higher than its source—the factory Consider then that the real victory of this race is the victory of the National factory that can build such wonderful cars.

Racing is but a part of the manufacturing process, where we test and perfect our cars for the comfort, safety and service of our customers.

The successful dealer will write us at once for our distributors' proposition and Series V Book. It is the 1913 style book and authority on motor cars.

The NATIONAL STARTER

Securely Founded Upon Right Principles

OF ALL types of starters today on the market none is more simple and direct in its action than the **National.** Dependent upon no other source of energy than that derived from a simple pressure of the foot it is free from all the trouble connected with starters operating on the acetylene gas, electric, compressed air and spring principle. It is built on a trouble-proof, mechanical principle, the efficiency of which has been proved in actual test 100 per cent perfect.

In point of safety the **National** proffers to motorists not only all the security of starting from the seat, but also the insurance against the dangers which of necessity are connected with starters which operate on an explosive principle. You will never blow out a cylinder head or set your car on fire if your starter is a **National.**

Certainty of starting is the **NATIONAL** watchword—100 times out of 100 today, tomorrow, and 5 years from now. Its efficiency is flawless—100% perfect. It will start your car regardless of whether your gas tank is empty or full, your storage batteries fresh or exhausted. You don't have to tinker with a switch, a pump, a handle or a gas distributor *before* you start. One operation—that of simply pressing the dash pedal—is all sufficient to get any car under way at any time.

NATIONAL ECONOMY exhibits itself to the motorist by an absence of upkeep expense and repair bills. *There are no charges for gas or electricity.* It costs nothing to operate a **NATIONAL.** It never requires the services of a mechanic to make it work. It never necessitates having the motor decarbonized. ¶ No bills accumulate on these scores—you pay for your **NATIONAL** but *once.*

The Starter Complete, attached to car, $50.

"Thirty" Semi-Touring
$1500

Every Inch a Car

No car can equal KisselKar comfort without equalling the wheel base.

60 H. P. "Six" 7 passenger
Touring $3000

EXTRA liberal wheel base permits the generously deep seats, and unusually roomy tonneaus which give an emphatically upper-class character and rare riding comfort to the KisselKar. With the liberal wheel base bridging the inequalities of the road, the big wheels, big tires, shock absorbers and deep seat upholstering absorbing road vibration, the KisselKar has an easy riding comfort which is approached by only a few American cars.

Another special advantage to the KisselKar owner, is KisselKar service. The KisselKar service organization, maintained by the manufacturer, with service-centers at principal points in America, extends the completest service to every owner of a KisselKar, minimizing running cost, retarding depreciation, and aiding to the fullest motoring enjoyment.

Our Average Profit on No-Rim-Cut Tires is 8½%

Last year our average profit on No-Rim-Cut Tires was 8½ per cent. Every penny we got, save a profit of 8½ per cent, went into size and quality.

That in a factory with the largest output and most modern equipment ever known in this industry. That in a business with fluctuating materials, on a tire that's guaranteed.

10 Years Spent Getting Ready

Goodyear No-Rim-Cut tires now hold the top-most place. They far outsell all rivals.

The success of this tire is a sudden sensation. But we began to perfect it 13 years ago.

We started with the idea that he who gives most will get most.

So we surrounded ourselves with the ablest experts we could find. And we told them to secure the maximum mileage without any regard to expense.

It was years before we approached tire perfection. It was ten years from the start before tire buyers realized what the Goodyear concern had done. Then came this avalanche of trade.

Rim-Cutting Ended

We found a way to end rim-cutting—a method controlled by our patents.

We examined thousands of ruined old-type tires, and we found that 23 per cent had been rim-cut. By ending this trouble---at vast expense---we saved tire users that 23 per cent.

In seven years' experience with No-Rim-Cut tires there has never been an instance of rim-cutting.

Adding 25 Per Cent to the Mileage.

Then we found that extras added to cars were overloading tires.

So we made these tires—No-Rim-Cut tires—10 per cent over the rated size.

That meant 10 per cent more air—10 per cent added carrying capacity. And that, with with the average car, adds 25 per cent to the tire mileage.

These two features together—No-Rim-Cut and oversize—for tens of thousands of users have cut tire bills in two.

Investigate These Tires

In view of these momentous tire facts, don't you think, Mr. Tire Buyer, that you ought to investigate Goodyear No-Rim-Cut tires?

The Largest Brake Business In Our History

DUPLEX EXTERNAL BRAKES

The remarkable demand for DUPLEX and RAYMOND brakes has resulted in a phenomenal increase in our business. At present we are operating our entire plant at maximum capacity. We have also rented additional space and added new machinery in an effort to keep ahead of our orders. Every effort is being made to supply the demand for our products.

"THERE'S A REASON"

Manufacturers, motorists and dealers have come to regard us as the foremost brake builders in the industry. Our designs have always led the field. Our workmanship and material is recognized as the best.

We not only supply DUPLEX and RAYMOND brakes complete, but we also manufacture large quantities of brake bands, lined, in accordance with special specifications. We recently received an order for 20,000 lined bands, demonstrating the remarkable demand for our products. We are pre-eminently brake specialists. Our customers include the better manufacturers throughout the industry. Dealers and owners always look to us when having brake troubles.

Our long years of experience, our service, our expert engineers and above all, our excellent facilities have proven our right to be known as—

The Leading Brake Builders of America

Polarine Oil

IS A

Standard Oil Product.

Polarine Oil for motor car lubrication has been produced as the result of long experience in the manufacture of oils for every use. Before being put on the market, it was subjected to most exhaustive practical tests.

It made good! Bob Burman used it when he broke the world's record ***for speed.*** The two big "Ocean-to-Ocean" tours (Premier and the Raymond & Whitcomb-Garford) both used it last year. ***It established a record for endurance.***

The sales of this product are phenomenal. Thus far this year, on its merits, and without extensive advertising, the sales of Polarine have exceeded all estimates. Here are its qualifications:

It burns cleanly, leaving practically no carbon.
It does not thin out at any speed or heat.
It feeds freely in cold weather.
It forms a lasting film on wearing surfaces, thus reducing friction and wear.

A good oil costs but little more than a cheap oil and adds years to the life of a car. We believe Polarine to be the best automobile oil yet produced.

We unhesitatingly recommend Polarine to every motorist.

Polarine Oil is sold in one and five gallon cans.
Insist on original packages. Booklet on request.

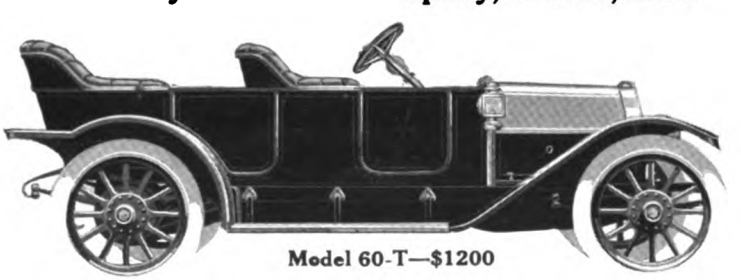
Overland

PRICE is the pivotal point in any automobile transaction A man expects quality although his better sense may tell him he is taking a long chance at the price.

Our Model 60 Overland sells at $1200.



We want to thoroughly imbue you with the confidence that this Model 60 is sold at a lower figure than any other similar car, but not at a price which jeopardizes the value—a price which might make quality—a doubtful proposition.

Only a duplicate of the Overland factory could produce a car at $1200 of similar capacity, power, silence, speed and comfort. The Overland plants have no duplicate in size or efficiency.

Model 60 is the car you should investigate. It will prevent you paying $1500 for the same value.

Write for book K-46.

Undeniable
Evidence Regarding
The Quality Of

HARRIS
TRADE MARK—REG. U.S. PAT. OFF.
OILS

We have prepared a handsome portfolio containing 42 fac-simile letters from users of HARRIS OILS.

If you want to know which lubricant actually is best, read these commendatory letters. We print herewith a few excerpts for the purpose of giving you an idea of what the users say about HARRIS OILS. Could you ask for higher indorsement?

"We tore down one car (Maxwell) lately that had been run for two years and we found there was no carbon in cylinder at all. We are so well pleased with your oil that you may ship us 2 barrels light oil by freight at once, as we are almost out of it."
McFADDEN AUTO COMPANY.

"Regarding the Harris Gasoline Engine Cylinder Oil wish to say we have been using this oil for the last five years and it has been giving us perfect satisfaction."
MITCHELL AUTOMOBILE CO.

"One of our customers, who was formerly in charge of repair department, has used this oil in his Packard car, and states it is the best oil he has ever used."
THE HOLCOMB COMPANY.

"Far superior to any other oil that we have ever used on Chalmers automobiles. We have had opportunity to really find out the merit of this oil by comparison with others, and we would not hesitate to say that it will run longer with less trouble from carbon than any other oil."
THE McDUFFEE MOTOR CO.

"Your superheated steam cylinder oil is giving perfect satisfaction. All the Stanley Steamer owners we sell this oil to will use no other kind of oil."
LACKA. VULCANIZING CO.

"Even your competitors claim only to have as good as Harris Oil. It is a pleasure to sell the class of products you produce."
GARAGE EQUIPMENT CO.

"We have averaged fully 3000 miles on Ford cars to one cleaning out of the carbon, this we believe you will readily agree with us, is so far beyond any results obtained by any ordinary oil on the market that there could not even be a comparison, we have had Ford's go as high as 4400 miles before it was necessary to clean out the carbon and the condition of the motor at the time of cleaning the car was easily good for another 1000 miles."
OTTUMWA AUTO CO.

"Beg to advise you that we use Harris Oil for our Locomobiles and have always found it satisfactory."
S. C. LOWE SUPPLY CO.

"We sell and use Harris Oil exclusively for the reason that it gives us greater satisfaction and seems to be better adapted for use in Gasoline Engines and severe service than anything we have tried, and we have tried about everything on the market."
EMERSON & ORNE.

"For the past eight or nine years, this office—The Peerless Motor Car Company of New England—has used Harris Oils almost exclusively for motor lubrication. During this time we have always received the very best of service from your Company and its representatives."
PEERLESS MOTOR CAR CO. OF N. E.

"After enjoying several years of constantly increasing business, selling Harris Gas Engine Oil and also giving the same severe tests under all conditions, we can only speak with the highest praise for Harris oils.
We are agents for the Overland, E-M-F, Flanders and Brush cars and would say that the oil works perfectly with any of the above."
MANLEY HDWE. CO.

The 25-Year Car

By R. E. Olds, Designer

I have spent 25 years in building automobiles. All I have learned is embodied in Reo the Fifth.

This splendid car, in every detail, marks the best I know.

If any man can build a car better he is a better man than I.

My Limit

The steel in this car is all analyzed to know it accords with my formulas.

The gears are tested in a crushing machine with 50 tons' capacity.

The carburetor is double heated—with hot air and hot water.

Roller bearings—Timken and Hyatt—take the place of ball bearings.

Tests and inspections, in every step of the making, are carried to extremes.

The margins of safety are much larger than usual.

The wheels are large, the tonneau is roomy, the car is over-tired.

The body finish consists of 17 coats. The lamps are enameled. The engine is nickel trimmed.

The upholstering is deep. It is genuine leather, filled with hair.

Inside and outside, regardless of cost, here's the best car I can build.

Center Control

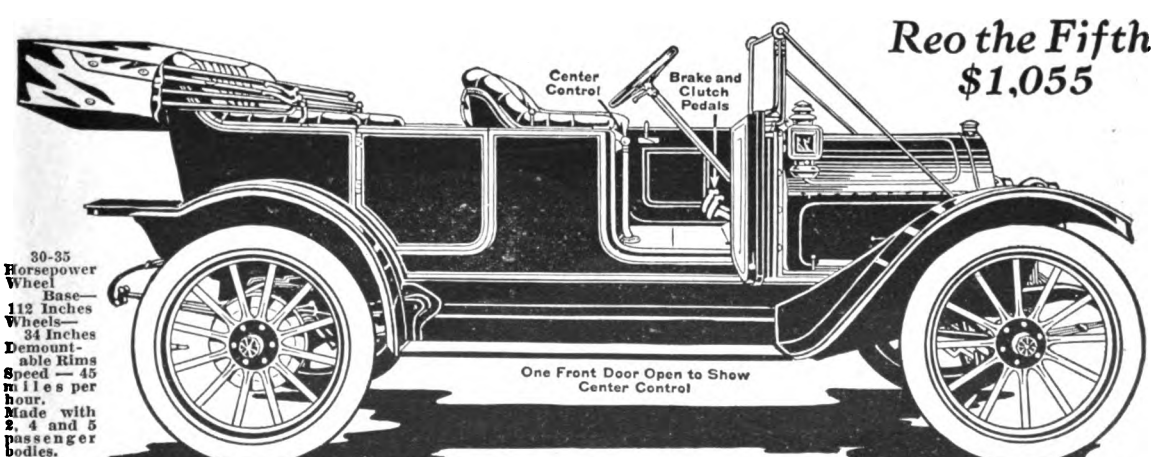
Reo the Fifth has my new center control. All the gear shifting is done by moving this lever less than three inches in each of four directions.

Both brakes are operated by foot pedals. There are no side levers, so the entrance in front is clear.

The driver may sit, as he should sit, on the left hand side.

The Little Price

The initial price of $1,055 is too low to continue, in my estimation. It is based on maximum output, on minimum cost for materials. I believe that it must be advanced.



While it continues, no car on the market begins to give for the money as much as does Reo the Fifth.

Ask for our books, giving all the details, picturing all the bodies. We have dealers in a thousand towns. Address

R. M. OWEN & CO. General Sales Agents for

REO MOTOR CAR CO., Lansing, Mich.

Canadian Factory, St. Catharines, Ontario

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip-cover, windshield, gas tank and speedometer—all for $100 extra. Self-starter, if wanted, $20 extra

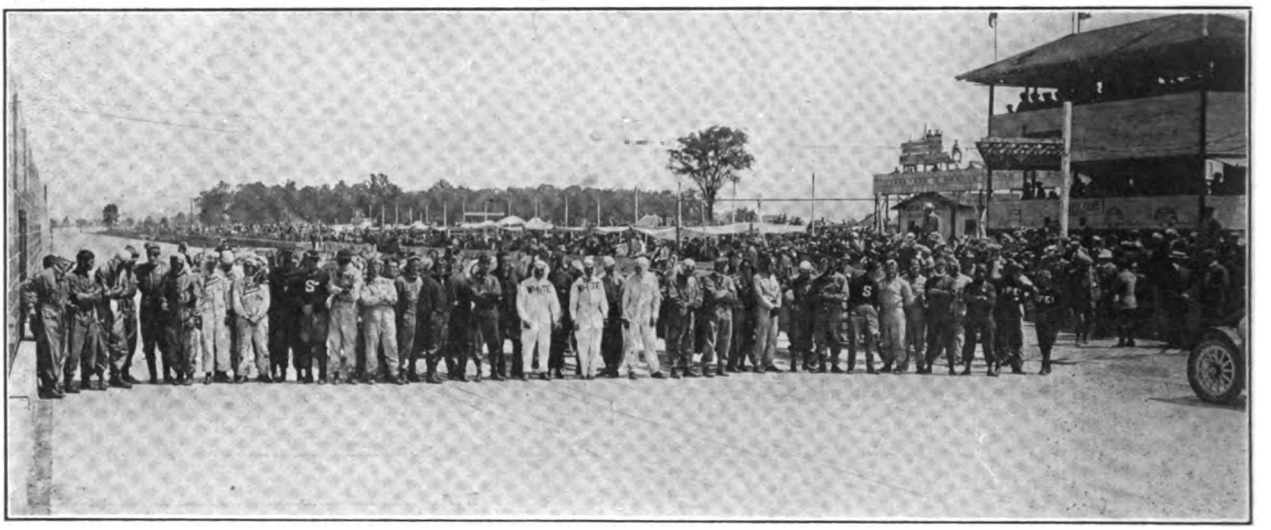
VOL. XXXIII, No. 9 JUNE 10, 1912 Price $1.00 the Year

DAWSON WINS IN A NATIONAL.

De Palma's Mercedes Fails Within Sight of the Goal in Second Annual 500-Mile Race at Indianapolis---Many New World's Records.

JOSEPH DAWSON, driving a National car, made by the National Motor Vehicle Company, Indianapolis, Ind., using Michelin tires and rims, Splitdorf magneto, Bosch plugs, Schebler carburetor, and Monogram oil, won the second annual international sweepstakes race for 500 miles on the Indianapolis speedway, Memorial Day, the time being 6:21:06. The average speed was 78.72 miles an hour. Last year's race was won by Ray Harroun in Marmon, his time being 6:42:08—an average of 74.59 miles an hour.

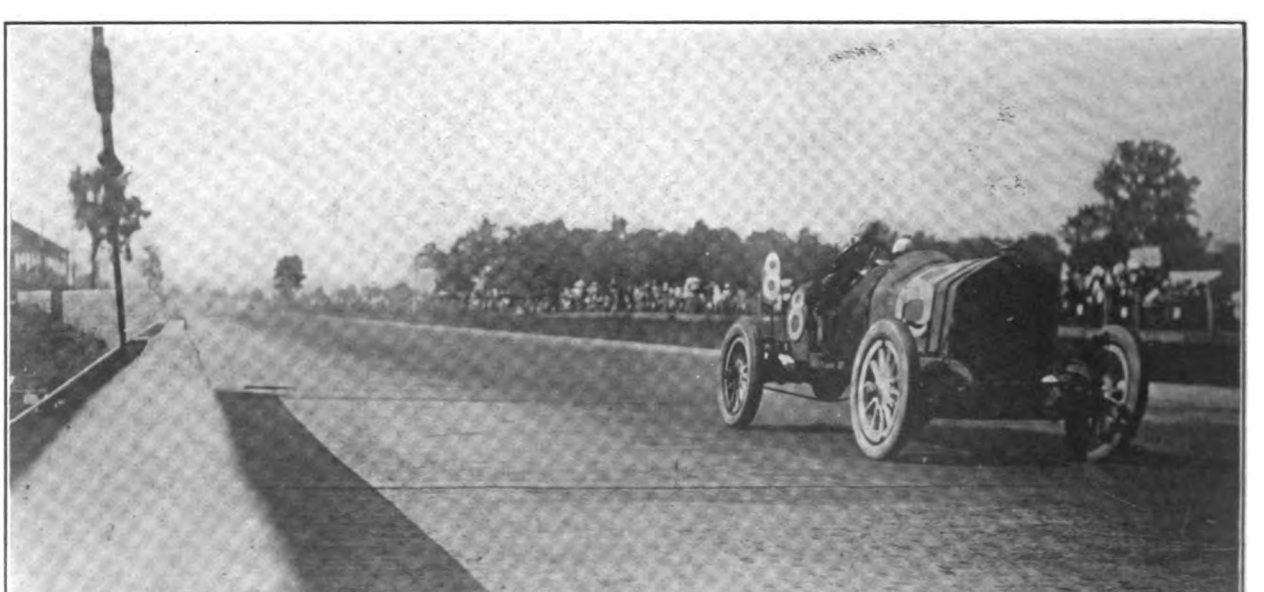


Line-Up of the Cars for the Grand Parade at the Start of the Second Annual 500-Mile Race on Indianapolis Speedway.

Never was there a better indication that the race is not always to the swift. Ralph De Palma, in a Mercedes, took the lead in this event on the third lap, and created new speedway records practically throughout the contest, only to come to a dead stop on the 199th lap. Dawson, who had been in second place throughout a large portion of the race, quickly took advantage of De Palma's misfortune and finished 10 minutes ahead of his nearest competitor. It was a remarkable exhibition of the consistent running and staying qualities of the National car. Something must be said as well of the generalship displayed by Joseph Dawson. He is an Indianapolis boy, who always heretofore has been seen at the wheel of Marmon cars. In last year's race he finished in fifth place with a car of that make. It was during 1910, when just 21 years of age, that Dawson first came into prominence driving his Marmon car to first place in five of the biggest victories of the year. Most of his driving has been without stop. However, in this event he relinquished the wheel to Donald Herr, an old National driver, for about 90 miles.

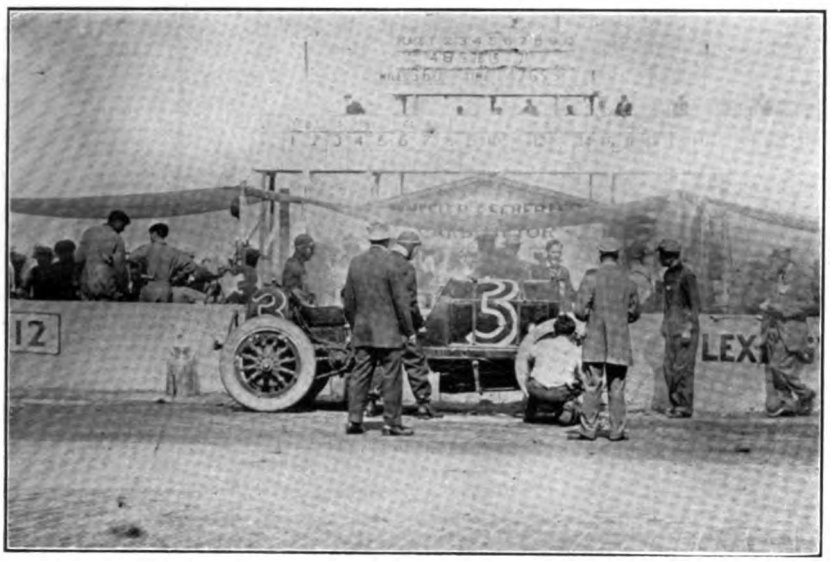
Second place went to Teddy Tetzlaff in the Fiat

Digitized by Google



Drivers, Relief Drivers and Mechanicians Who Took Part in the Second Annual International Sweepstakes Event at Indianapolis, Memorial Day.

with which he won the recent Santa Monica road event. His machine was shod as before with Miller tires, and the rims were of the Dorian make. His magneto was a Bosch; the spark plugs, Bosch, and the carburetor, a Fiat. The Fiat's time was 6:31:40. To Caleb Bragg, Tetzlaff's relief driver, belongs the honor of first placing the car in second position, he having pushed Dawson out of it for a time about the 260th mile.



Perhaps the most surprising result of the day was the driving of Hugh Hughes, who finished third with the little 30 horsepower Mercer. His time was 6:33:09, and that he was able to complete 500 miles within less than two minutes of the time required by the high powered Italian made Fiat, speaks volumes for the product of the Mercer Automobile Company, Trenton, N. J. There were four machines equipped with wire wheels in the event, and of these one was the Mercer. The wheels were imported, being of the Rudge-Whitworth manufacture, and were shod with Michelin tires. Bosch magneto and plugs and Rayfield carburetor also were employed.

Of the 27 cars entered, but 24 started, and of the latter but nine finished. Ralph Mulford in a Knox was still running when the race was called off. It follows that of the 12 prizes, but 10 were awarded, the rest reverting to the speedway management. The tabulated results are shown herewith.

Joseph Dawson in the National 8, Finishing in First Place, Creating a New Speedway Record, and Winning $35,000 in Prize Money.

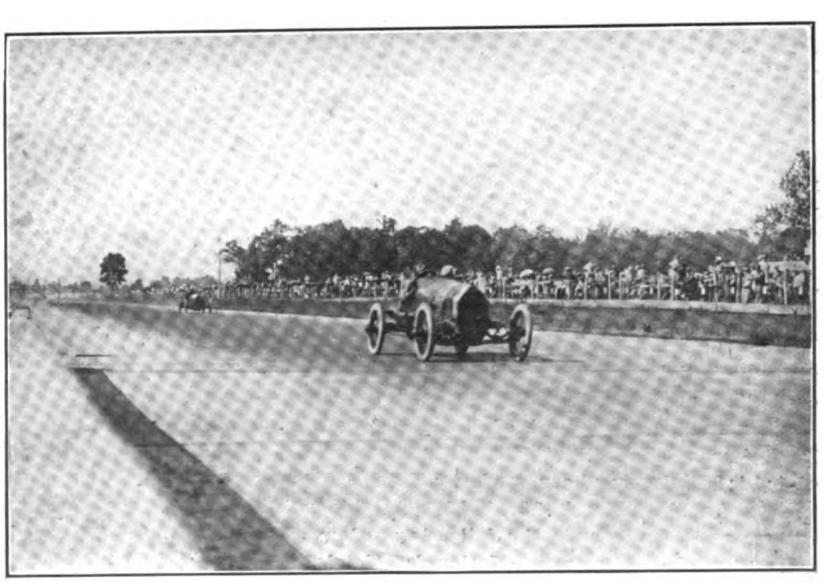
9—National,	Wilcox,	Rader	7:11:30
10—Knox,	Mulford,	none	———



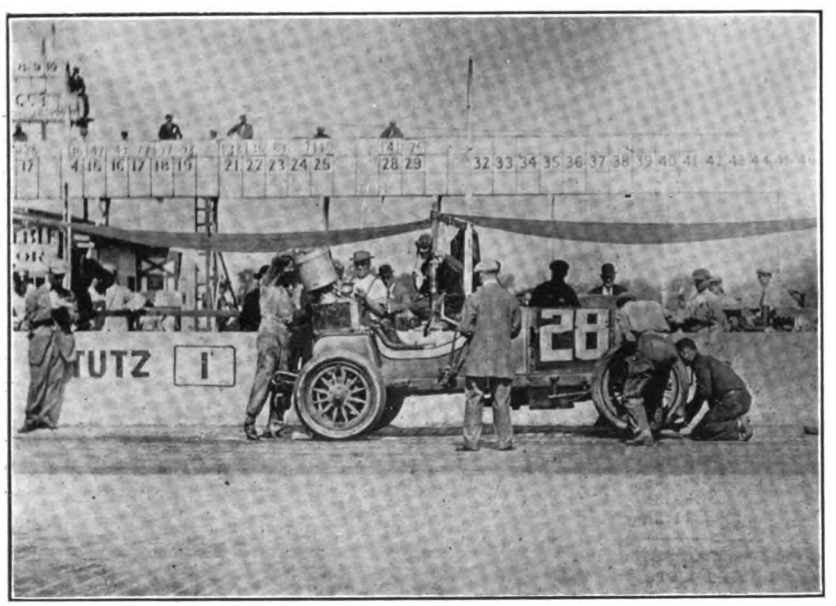
In the matter of accessories: Michelin tires were fitted to all of the cars in the above table, with the single exception of the Fiat. Splitdorf magnetos took the first, fourth, fifth, sixth and ninth prizes; Bosch magnetos secured the second, third and 10th, and a Mea magneto, the seventh. Bosch plugs were used on all of the cars to finish, while the Knox employed Red Head plugs.

Schebler carburetors took the first, fourth, fifth, sixth and ninth awards, and the Rayfield, the third, eighth and 10th. The Fiat and White utilized vaporizers produced by the car manufacturers. Monogram oil was used by all of the cars which finished except the second and last, which employed Oilzum. An accompanying table gives the detailed equipment of the competing cars, so far as it can be secured from the drivers or manufacturers.

Seventy-five thousand people saw the race, as against approximately 70,000 in 1911. Last year 8000 cars were parked in the space reserved for them while this year there were nearer 12,000. The field was limited to 30 entrants, and only 24 started, whereas last year, there was no limitation and some 40 machines were sent away. There were a few accidents this year, but no one was seriously hurt, and taking it all in all, it was one of the best exhibitions of motor speed that ever has been witnessed in this country or abroad. Already, it is being freely predicted that next year's event will see the entry of a large number of foreign cars driven by foreign men.

As last year, the opening was in the nature of a triumphal procession. In the lead was Carl G. Fisher, president of the Indianapolis speedway, in a Stutz as pacemaker. In the first line were Anderson, Stutz 1; Zengel, Stutz 2; Tetzlaff, Fiat 3; De Palma, Mercedes 4, and Hearne, Case 6. The second line was made up of the following: Wishart, Mercedes 7; Dawson, National 8; Wilcox, National 9; Knight, Lexington 10, and Dingley, Simplex 12. Then came Jenkins, White 14; Burman, Cutting 15; Frayer, Firestone-Columbus 16; Liesaw, Marquette-Buick 17, and W. Endicott, Schacht 18. In the fourth row were: Mulford, Knox 19; Hughes, Mercer 21; Horan, Lozier 22; Marquette, McFarlan 23, and Ormsby, Opel 24. Last of all were: Matson, Lozier 25; Merz, Stutz 28; Bruce-Brown, National 29, and Disbrow, Case 5.

Once around the 2.5-mile track they went in parade formation—and then they were off. Tetzlaff was leading before a quarter of the distance had been covered on the first lap of the race. He finished this lap in 1:43.49. De Palma was second; Wishart, third; Dingley, fourth, and Dawson, fifth. Again they went



Hugh Hughes Finishing in Third Place with the Mercer 21.

Digitized by Google

around the track, and Tetzlaff still had the lead, although De Palma and Wishart were crowding him closely. Dawson and Wilcox were close behind them.

On the third lap both De Palma and Wishart passed Tetzlaff, the former in the lead. Wilcox went into fourth place. On the fourth round, the position of the two leaders was unchanged, but Bruce-Brown in the third National was in third place. Tetzlaff was fourth, and Wilcox fifth.

Charles Merz in the Stutz 28, Who Disputed Hughes' Right to Third Award.

For 25 miles they raced in practically the same position. At this point, it was De Palma, Wishart and Bruce-Brown, followed by Mulford and Tetzlaff. The time for the distance was 14:38. In the very next lap, however, Bruce-Brown pulled into second place and was close behind De Palma. Wishart was third, and Mulford fourth. Wilcox's National halted on the 12th lap, and Burman replaced him in fifth place.

At the end of 50 miles, De Palma and Bruce-Brown were contending for first place, with the former in the lead. Mulford was in third place, and right behind him were Dawson and Tetzlaff. The time at this point was 36:39.

Sixty miles was covered by De Palma in 43:59, with Bruce-Brown still in second place. At 70 miles, it was De Palma, Tetzlaff and Dawson. At 80, De Palma was followed by Dawson and Mulford, and the distance had been covered in 58:33. De Palma covered 82.5 miles during the first hour.

A new world's record of 1:13:01 was set up by De Palma at the end of 100 miles, the former mark of 1:14:29.2 having been made by Tetzlaff in a Lozier at Los Angeles, March 19, 1911. At this point the drivers and cars were in the following order: De Palma, Mercedes; Dawson, National; Tetzlaff, Fiat; Wishart, Mercedes; Anderson, Stutz; Frayer, Firestone-Columbus; Merz, Stutz; Burman, Cutting; Hughes, Mercer; Marquette, McFarlan; Mulford, Knox; Zengel, Stutz; Jenkins, White; Farr, Marquette-Buick; Horan, Lozier; Matson, Lozier; Endicott, Schacht; Dingley, Simplex; Wilcox, National. Last year's time for 100 miles was 1:18:22.

At 120 miles, it was De Palma, Dawson and Tetzlaff, the time being 1:27:26. At 140 miles, the three leaders were in the same position, the time being 1:41:52. Another new world's record was passed at 150 miles, De Palma covering the distance in 1:49:00, while Bruce-Brown in a Fiat took 1:57:15 a year ago.

Three cars had been withdrawn at this time. Marquette in the McFarlan went off the track on the 63rd lap, but neither the driver nor mechanician was injured. In the 80th lap, Anderson's Stutz ceased to be a contender. Herrick's Case which was being driven by Whallon at the time, also went out of the running.

Both De Palma and Dawson stopped for tires on the 180th mile. At 200 miles, De Palma's time was 2:24:46, as against Bruce-Brown's 2:39:28 of last year. De Palma was leading the entire field by a lap at this point, with Tetzlaff second and Dawson third. The rest were in a long string.

Soon afterward, Hughes' Mercer ran out of gasoline and he and his mechanician were forced to push it down the track to the pits for another supply. This should be remembered in considering the fact that he finished in third place, less than two minutes behind the Fiat.

De Palma turned 250 miles in 3:03:34, while Bruce-Brown's best of 1911 was 3:17:34. For the second time, Dawson's National and De Palma's Mer-

cedes needed new shoes at the same instant, and started again practically together. The following had ceased to prove contenders at this point: Bruce-Brown's National, Ormsby's Opel, Hearne's Case, Frayer's Firestone-Columbus, Knight's Lexington, Marquette's McFarlan, Anderson's Stutz, Liesaw's Marquette-Buick, Disbrow's Case and Wishart's Mercedes.

De Palma was three laps ahead at 300 miles, which he covered in 3:43:21, as against 4:01:25 for Harroun in 1911. The drivers, their positions and number of laps at this point, follow: De Palma, 120; Dawson, 117; Burman, 117; Tetzlaff, 115; Hughes, 114; Merz, 112; Horan, 111; Jenkins, 111; Endicott, 111; Zengel, 109; Wilcox, 102; Matson, 100; Dingley, 97; Mulford, 83. About this time, Dingley's Simplex caught on fire at the pits, but the flames were extinguished with chemicals, and he was soon in the running again.

Burman and his Cutting were strong competitors from the 300th to the 395th mile. Burman, Dawson, Tetzlaff and Merz were exchanging places frequently, although De Palma was too far ahead to mind it at all. At 350 miles, De Palma's time was 4:19:35.

It was on the 390th mile that Burman made a brave attempt to win a lap over Dawson, who was by this time nearly six minutes behind De Palma. For some reason, the big Cutting failed to make the turn as its driver had expected. The car overturned, but the two occupants were picked up only slightly injured. Burman insisted upon watching the completion of the race from the pits. Tetzlaff immediately resumed the third position.

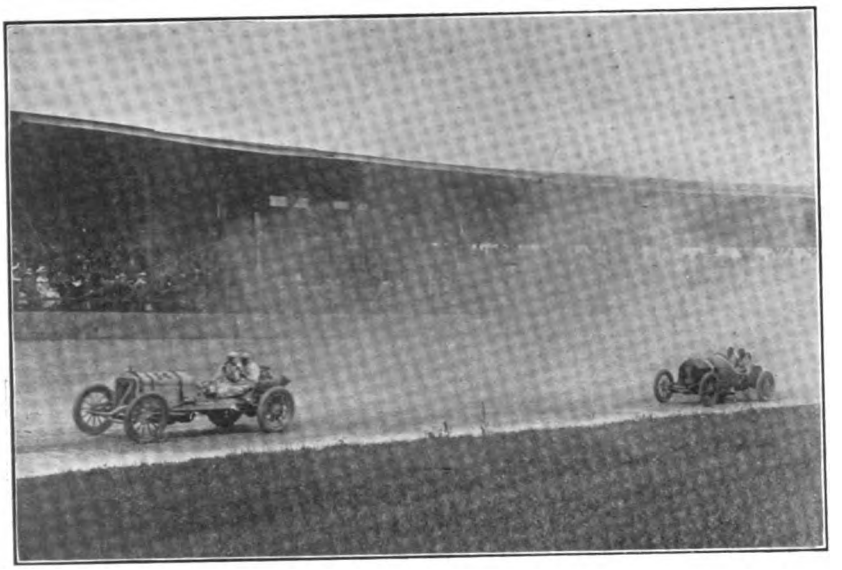
At 400 miles, De Palma's time was 4:56:34, as compared with Harroun's 5:23:15 of last year. The drivers, their position and number of laps at this point were: De Palma, 160; Dawson, 156; Tetzlaff, 153; Merz, 151; Hughes, 149; Jenkins, 147; Endicott, 146; Horan, 144; Knipper (Stutz), 143; Wilcox, 137; Mulford, 109.

At the end of 420 miles, it was De Palma, Dawson and Tetzlaff. It was the same at 440 and 450. Here De Palma's time was 5:35:32. He had gained a fifth lap over Dawson. At 460 miles, Wilcox lost some time at the pits, because of trouble with his gasoline feed pipe. De Palma covered this distance in 5:43:14. He drove 475 miles in 5:58:06.

At the end of 480 miles, it looked very much as if there were little hope for Dawson and his National. Second place was expected, and the men in the National pits had begun to resign themselves to this result. Suddenly, there was decided change in the situation. On the lap which began the 491st mile for De Palma, his car began to feel the sustained strain,

Joseph Dawson at the Wheel of the Winning National.

or at least the engine seemed to do so. He covered one lap at low speed, while Dawson passed him twice.



With less than five miles to go, the Mercedes limped around the track to back stretch, whence De Palma and his mechanician did their best to push it into the pits. With a little more than one lap between him and the first prize, De Palma was forced to see the others pass him one after the other, again and again. Less than five miles separated him from $35,000.

The crowd went wild. It mattered little to them that a man's heart was breaking, albeit De Palma's

John Jenkins in White 14, Leading William Endicott in Schacht 18.

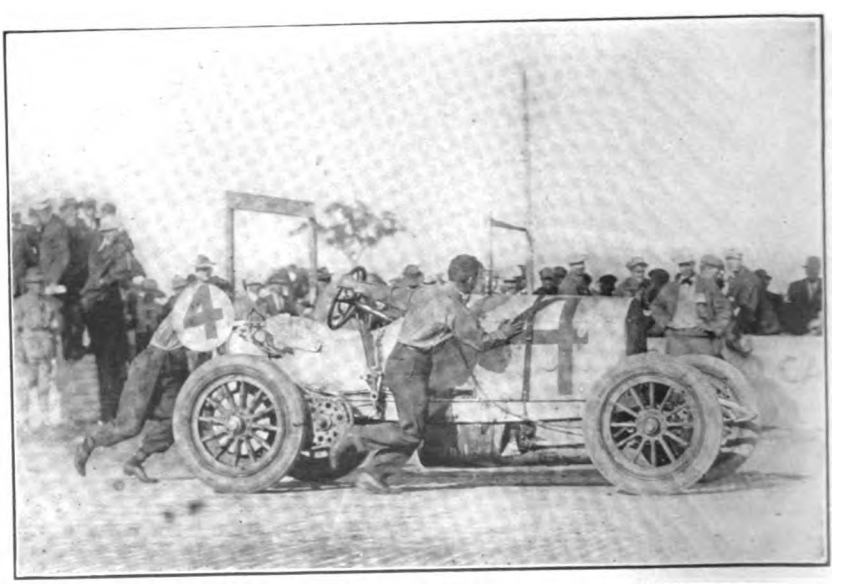
habitual smile never left his face. Mrs. De Palma was in New York throughout the race, and at the end of every 25 miles, someone in the pit telegraphed her husband's position. At 475 miles, she had learned that De Palma was leading the field, almost eight minutes ahead of Dawson. At 500 miles, she read the message that told her her husband's fondest dreams had been shattered in sight of the goal.

But the crowd did not know this. They did not care. A moment before they were cheering De Palma on to victory. Now they cheered, perhaps just a little more fervently, for Dawson. It was a patriotic crowd. De Palma's car was of German manufacture. Dawson's National was not only an American machine, but a product of Indianapolis. Flags were flying, hats were in the air—it was by far the most exciting finish that has greeted any automobile race in this country. Dawson drove twice around the track after receiving the checkered flag, in order to dispel any possible doubt as to the distance he had covered.

After the race was won, Dawson stopped only long enough to receive the congratulations of his friends, then went straight to the home of his parents, Mr. and Mrs. Chase F. Dawson, 2828 North Illinois street. "Mother, I won!" he exclaimed, as he entered the door, $35,000 richer than when he left in the morning. Half an hour later he was in the Y. M. C. A. swimming pool.

The $35,000 was made up of the $20,000 prize awarded by the speedway management and $15,000 in accessory prizes. Tetzlaff's share of the main prize was $10,000: Hughes, $5000; Merz, $3500; Endicott, $2500; Zengel, $2000; Jenkins, $1500; Horan, $1400; Wilcox, $1300; Mulford, $1200. Tetzlaff and Hughes also will receive substantial additions in the way of accessory awards.

It is only fair to state that the awarding of third place to Hughes in a Mercer was contested by the Stutz team, and particularly by Merz, who finished in fourth place. Referee A. R. Pardington gave out the figures as set forth here as official, May 31, the day following the race. It is not stated definitely whether the protest will be forwarded to the contest board of the American Automobile Association, which has final jurisdiction over such matters. So far as the official time is available, the position of the drivers and cars at each 50-mile period, based upon the position of the leader was as follows:



Fifty miles—First, De Palma, Mercedes; second, Bruce-Brown, National; third, Mulford, Knox; time, 36:39.

One hundred miles—First, De Palma, Mercedes; second, Dawson, National; third, Tetzlaff, Fiat; time, 1:13:01.

One hundred and fifty miles—First, De Palma, Mercedes; second, Dawson, National; third, Tetzlaff, Fiat; time, 1:49:00.

Two hundred miles—First, De Palma, Mercedes; second, Tetzlaff, Fiat; third, Dawson, National; time, 2:24:46.

Two hundred and fifty miles—First, De Palma, Mercedes; second, Dawson, National; third, Burman,

Digitized by Google

Cutting; time, 3:03:34.

Three hundred miles—First, De Palma, Mercedes; second, Dawson, National; third, Burman, Cutting; time, 3:43:21.

Three hundred and fifty miles—First, De Palma, Mercedes; second, Dawson, National; third, Burman, Cutting; time, 4:19:35.

Four hundred miles—First, De Palma, Mercedes; second, Dawson, National; third, Tetzlaff, Fiat; time, 4:56:34.

Four hundred and fifty miles—First, De Palma, Mercedes; second, Dawson, National; third, Tetzlaff, Fiat; time, 5:35:32.

Five hundred miles—First, Dawson, National; second, Tetzlaff, Fiat; third, Hughes, Mercer; time, 6:21:08.

The entire story of the Indianapolis race cannot be written, however, without mention of the graceful act of the Bosch Magneto Company, New York City. As Ralph De Palma, whose Mercedes was equipped with a Bosch instrument, stood on the deck of the Kaiser Wilhelm der Grosse, awaiting the hour of its departure from the Hoboken pier, A. H. Bartsch, advertising manager of the company, on behalf of President Otto Heins, presented him with a "consolation prize" of $250.

This was real sympathy in concrete form, and De Palma was greatly surprised. He goes to France, accompanied by David L. Bruce-Brown, where they will be at the wheels of Fiat cars in the Grand Prix later this month.

S. C. A. T. WINS TARGA FLORIO.

The seventh annual Targa Florio race over the Tour de Sicily, Italy, was held May 26-27. Four American cars, three Fords and an Overland, were entered, and one of the former secured sixth place. The distance was 632 miles, covering some of the hill sections of the country, and the result was as follows:

Car	Driver	Time
1	S. C. A. T., Scipe	23:37:19
2	Lancia, Garretto	25:07:38
3	Fiat, Gloradano	25:41:04
4	Deutz, Moraes	25:52:08
5	Fiat, Lopez	26:57:37
6	Ford, Fracassi	27:12:43
7	Lancia, Olson	27:24:26
8	Fiat, Trombetta	29:45:20

NATIONAL RELIABILITY TOUR.

Detroit has been selected as the city from which the annual national tour for the Glidden, Anderson and A. A. A. trophies will start. The concluding portion of the trip will be from Memphis to New Orleans, although the details concerning the first part of the itinerary have not been decided upon by the special committee, consisting of Col. Frank M. Joyce, Minneapolis; Lewis R. Speare, Boston; John A. Wilson, Franklin, Penn.; W. E. Metzger, Detroit, and W. E. Moyer, Des Moines. The date for the tour has not been selected, but it is expected that it will be held some time in October.

PABST BLUE RIBBON TROPHY.

Col. Gustav Pabst, president of the Pabst Brewing Company of Milwaukee, has presented the Milwaukee Automobile Dealers' Association a new cup for the medium car race held in connection with the Vanderbilt Cup event, to be known as the Pabst Blue Ribbon trophy. It will be turned over to the Motor Cups Holding Company, which has jurisdiction over the custody of the Vanderbilt and Grand Prize awards. It has not been definitely determined whether the Pabst prize will be offered for American made cars alone, or thrown open to the manufacturers of the world. The deed of gift provides that the cup shall carry with it a cash award of $2500 to the winning driver.

COMING EVENTS.

June.

June 11-13—Reliability tour, Washington, D. C.
June 15—Track race, Brighton Beach, N. Y.
June 20—Algonquin hill climb, Chicago, Ill.
June 20-22—Reliability run, Portland, Me.
June 23—Track meet, Laurel, Del.
June 25-26—Grand Prix, Dieppe, France.

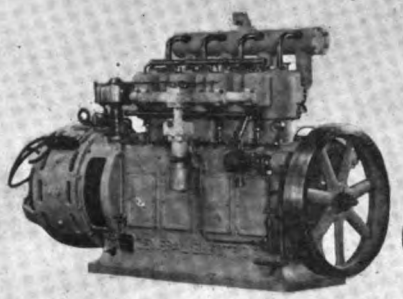
July.

July 3-5—Track events, Belle Fourche, S. D.
July 4—Track events, Petersburg, Ind.
July 4-5—Track events, Taylor, Tex.
July 4-6—Beach events, Old Orchard, Me.
July 5-6—Road race, Tacoma, Wash.
July 6-7—Reliability run, Chicago, Ill.
July 9-24—Four-States tour, Indiana.
July 15—Reliability tour, Wisconsin.

August.

Aug. 8-10—Beach races, Galveston, Tex.
Aug. 23-24—Road races, Elgin, Ill.

September.



Sept. 2—Speedway meet, Indianapolis, Ind.
Sept. 7—Track meet, Hamelin, Minn.
Sept. 9—International aviation race, Chicago, Ill.

October.

Oct. 7-11—Reliability trials, Chicago, Ill.
Oct. 12—Track events, Salem, N. H.

Gasoline-Electric Sets Generating Current for the Garage and Repair Shop.

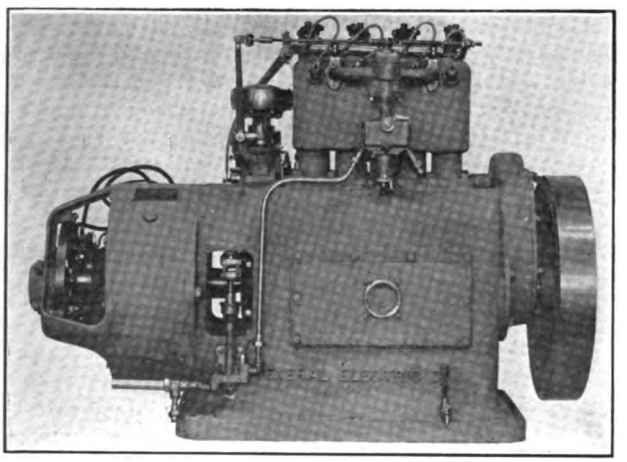
ALTHOUGH the development of the internal combustion motor may be attributed, to a certain extent, to the automobile, its industrial value was early made manifest, and today it is utilized wherever a small power plant is required. It has replaced older forms of energy, such as some types of water wheels, wind mills, etc., and even in some instances, steam. Its convenience is an established and accepted fact, as the gasoline engine may be operated as little or as much as desired, needing no other attention than fuel and lubricant. Its economic value lies in that by simply throwing a switch and turning a lever, power is developed instantly, and when not in operation no expense is involved.

Power Equipment Important.

Throughout the country the mechanically propelled vehicle is supplanting the horse drawn, both for pleasure and commercial purposes, and the rapidly increasing number of these in service affords opportunity for the establishment of garages and repair shops for their care and maintenance. Where these are located outside the zones of the central service station, the question of power is an important factor, inasmuch as it is essential that the equipment be complete to comply with the peculiar requirements of the business. In order to meet competition the garage and repair shop must include those facilities which make for reliable and prompt service, and it is reasonable to presume that the country resident will insist upon the same attention as may be obtained in the city.

Depicting One Kilowatt Gasoline-Electric Generating Set Which Develops a Direct Current at a Steady Voltage.

Energy for operating the lathe, drilling and milling machine, compressor, water pump, etc., can be supplied by the gasoline engine, but the repair industry necessitates more or less night work. This brings up the question of proper lighting facilities. Unlike some trades, the mechanical features of the automobile require an efficient portable light. The kerosene or acetylene lamp is not suitable owing to the danger of even a small amount of gasoline being ignited by the naked flames, creating considerable damage if not total destruction of the property.



Advantages of Electricity.

The advantages of electricity in the garage are legion. Not only is an excellent and safe light obtained but the current may be utilized for numerous purposes. It may be employed to operate a portable drill, polishing machine, air compressor, machinery, etc., and in addition the commodity has another important value in that a desirable trade may be built up in the charging of electric vehicles and storage batteries. Ignition batteries are generally employed with the motor car and the garage which is compelled to send its customer's batteries to the city for recharging receives but little recompense thereby, to say nothing of the delays and danger of injury during the transportation of the current containers.

It is only natural to presume that the garage situated beyond the zone of the central station would attract a desirable clientele if equipped with adequate facilities for the charging of electric vehicles, as it is obvious, for instance, that many summer residents would utilize electric carriages were means obtainable for charging.

The early attempts to couple the gasoline motor to the generator were not satisfactory, owing to the special conditions demanded of the unit. An efficient

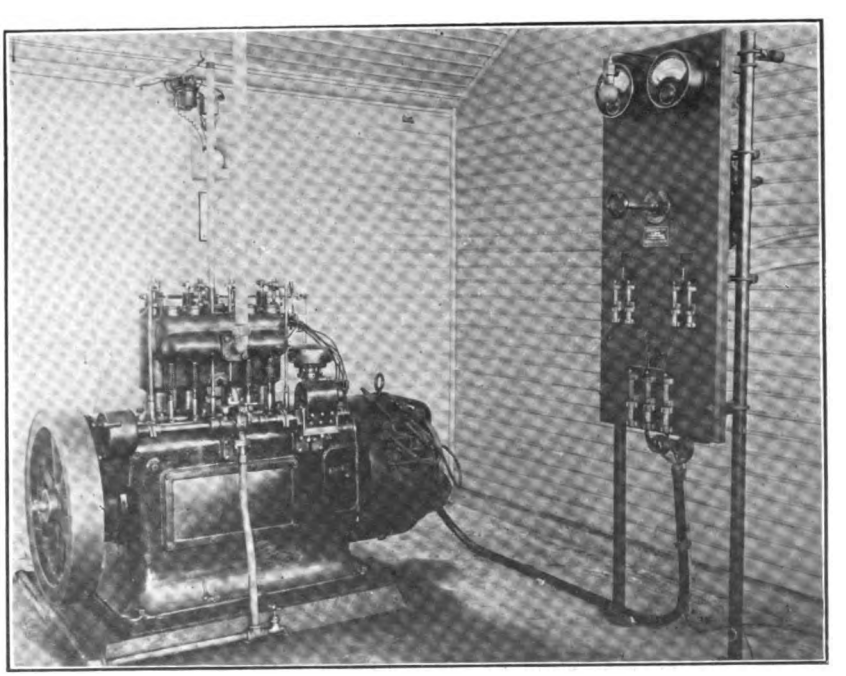
Digitized by Google

Three Kilowatt Generator Is Operated by a Four-Cylinder, Four-Cycle Motor and Furnishes 2400 Candlepower.

gasoline-electric set requires a direct or shaft drive with speed sufficiently high and with impulses frequent enough to produce the even turning movement absolutely essential to steady voltage. The motor also should be so governed as to insure the maintenance of uniform speed on both fixed and varying loads. Other necessary features are: Economical fuel consumption; high electrical efficiencies at the rated capacity of the set, with a minimum of decrease in efficiency and increase in fuel a kilowatt at slightly underloads, and ability of the unit to carry an overload without undue overheating of the generator.

Application of Service.

The United States government was one of the first to demand a unit to meet the above requirements and to conform to these as well as the demand for a lighting equipment for an installation beyond the zone of the central station, the General Electric Company, Schenectady, N. Y., began experimentations, which resulted in the manufacture of the gasoline motor driven electric generating sets illustrated herein. These are designed for the specific purpose of supplying the best quality of service where electricity is not otherwise available.



These units may be employed to supply current for charging electric vehicles, and ignition or lighting batteries; to operate the machine equipment of the garage, and to light it as well. They are constructed in four sizes, ranging from one to 25 kilowatts and with the exception of the smallest the gasoline motors are of the four-cylinder, four-cycle, water-cooled type. The one kilowatt set has a single-cylinder, two-cycle engine, with three-inch bore and stroke.

The operation of these outfits is exceedingly simple. To start the set the ignition current is switched on and the engine cranked. Mounted upon an extension of the engine shaft is the armature of the generator, and as it begins to revolve between the poles of powerful magnets, the cutting of the invisible lines of magnetic force between these poles by the copper conductors of the armature produces an electric current by a process called induction. This is collected from the commutator by means of brushes and is transferred over the wire circuit, where it is always ready to be utilized for light, heat or power, or it may be stored in a battery.
